Indian Muslims can serve Islam and themselves best by associating themselves with persons and parties who aim at making democracy as real as possible and at achieving the maximum of social justice and social welfare through the legislative and administrative action of the State.

Abid Husain, a Shia married to Swaliha Abid Husain, a front rank Urdu writer and a descendant of Hali, studied at Allahabad, Oxford and Berlin. He taught philosophy and literature at the Jamia from 1926 to 1956, authored a number of books, and translated German, English and French works into Urdu. His forte lay in analysing and evaluating movements outside the conventional category of religion. He held the view that "the work of integrating the various communities into a nation ... cannot be and should not be done on the religious but on the secular plane". To combat divisive tendencies, it was necessary to impart practical training in schools and colleges "in citizenship based on the high ideals of nationalism, secularism and democracy".

The Destiny of Indian Muslims, along with Abid Husain's other works, helps to comprehend how educated Muslims saw their own role and their community's place within secular paradigms. The journal *Islam and the Modern Age* and the 'Islam and the Modern Age Society' reflected his larger intellectual concerns. *The Destiny of Indian Muslims*, published in 1965, was a well-conceived statement of a Muslim steeped in the nationalist values and traditions of Ajmal, Ansari and Azad. He dwelt on a common 'national culture' based on the secularism of the Indian state, and on 'religious awakening' and a 'spiritual renaissance' among Muslims. His concern was to prevent Muslims from "drifting away from the mainstream of national life" though the agenda he set for himself and the secular and religious leadership was simple enough: drastic changes in the curriculum of 'maktab' and 'madarsas', reforms in other Muslim institutions, and the exercise of 'ijtihad' to cope with the demands of the new age. He observed: "For the last hundred years things have changed and the modern ulama must give a fatwa

giving a new ijtihad to the provisions of the Muslim law".

Scholars at the Aligarh Muslim University, especially in the departments of history, geography, Islamic studies and Urdu, were also engaged in constructing the past in secular terms. This was a task undertaken by Mohammad Habib, brother of Mujeeb, and some of his fellow-historians. The tone was set by Zakir Husain, who departed from the Jamia Millia in 1948 to join the Aligarh Muslim University as its vice-chancellor. When he joined Aligarh an atmosphere of gloom and uncertainty prevailed because of the university's close identification with the Muslim League and the Pakistan movement. But he changed it all. Imbued with a mission "of great national significance", his task was "to build a united nation in a democratic secular State and the role and status of its forty million Muslim citizens within it", weld together diverse cultures into a harmonious whole and promote its growth "in such a manner that each culture shines and lends beauty and strength to the entire whole".

V

There were other visible signs of change on the horizon. Scholars debated the highly emotive and contentious issue of reforming Muslim family laws. What is there to reform in Muslim personal law? Is reform possible in Islam? Is the Islamic law a product of human intelligence and adaptation to social needs and therefore amenable to modifications and changes? Or, is it of divine inspiration and hence immutable? If so, what lessons should be drawn from the history of reforms in Muslim countries? Or, what weight should one attach to the views of Muslim thinkers in India such as Iqbal, who believed that Muslim liberals were perfectly justified in reinterpreting fundamental legal principles "in the light of their own experience and the altered conditions of modern life"?

There were no simple or straightforward answers. The key issues that figured, for example, at the International Congress of Orientalists in 1964 and at a seminar held also in Delhi five years later, related to the shariat's divine and sacrosanct character, the preservation of 'Muslim identity' and the fear of their social system being 'Hinduised'. Traditional or conservative opinion, articulated by the Jamaat-i Islami and the Jamiat al-ulama, was profoundly indignant at the prospect of a change or modification in personal law. Changing laws based on specific injunctions of the Quran or the hadith was 'unimaginable'. Attempts to persuade Muslims to substitute man-made laws for "the universal and faultless laws given by God is a waste of time". The

Quranic regulations were authoritative and final for all occasions, and for all epochs between the time of revelation and doomsday. Those wanting to tamper with them were enemies of Islam and its followers. Thus the Jamiyat al-ulama leader, Maulana Asad Madani, viewed the plea for reforms as "a mask for the Jana Sangh's sinister designs to exterminate the Muslim community from India".

A section of the reformist ulama were not swayed by the rhetoric of their more diehard colleagues. Maulana Said Ahmad Akbarabadi, editor of *Burhan*, was one of them. He was educated at Deoband, served as principal of the Madarsa-i Aliya in Calcutta, and retired as professor of theology at the Aligarh Muslim University. He was one of those who made a distinction between those Quranic injunctions which are specific to Arab customary law of the time, and those applicable to Muslim and human societies in other times. He insisted, moreover, that the ulama take note of the changes taking place around them, to formulate their ideas in the light of modern thought. The fact that they did not do so was largely because they did not pay heed to the admonition of Deoband's illustrious co-founder, Maulana Qasim Nanotawi, that traditional education should always be combined with modern knowledge. And he rigorously argued that the concept of 'tauhid' (unity of god) implies the unity of all people and all nations. So also was divine revelation or divine guidance ('al-huda'): "It was not only Universal but one and the same also". He quoted Azad approvingly who had pointed out in the *Tarjuman al-Quran* that "the great emphasis that the Quran lays on this truth, the stronger has been the inclination on the part of the world to relegate it to the background".

A A A Fyzee, a well known scholar of jurisprudence, held the view that Islam had ceased to be dynamic, religious practices had become "soulless rituals", the spirit of the prophet's message was throttled by fanaticism, its theology was gagged by history, and its vitality was sapped by totalitarianism. He made a strong case for releasing the "spirit of joy, compassion, fraternity, tolerance and reasonableness". More importantly, he positioned himself against the traditional view that in Islam law and religion are coterminous, because law is a product of social evolution and must change with time and circumstances. He was convinced that "gradually all individual and personal laws, based upon ancient principles governing the social life of the community, will either be abolished or so modified as to bring them within a general scheme of laws applicable to all persons, regardless of religious differences". Such a development, he pointed out, will not

destroy the essential truth of the faith of Islam". To an independent Muslim observer, himself a Muslim, "it would seem that no one can change the fate of the Muslims of India, except the Muslims themselves".

Some of these ideas were inspired by Azad's *Tarjuman al-Quran* and his emphasis therein on the rudiments of religious pluralism, which constituted the basis of the Maulana's modernism. Fyzee regarded this as the only pragmatic solution for the Indian Muslims, and for the preservation and progress of Islam in a composite society. M H Beg, a distinguished jurist, boldly suggested that Muslim jurisprudence could contribute valuable ideas on formulating a uniform civil code of personal laws. Muslim jurisprudence "has acted and could still act as a part of that common stock of juristic ideas which have acted and reacted upon each other to produce a composite culture in this country which sustains the secular state".

There was, predictably, criticism of and strong opposition to the liberal and secular credo. In fact, some analysts pointed out that the Muslims after 1947 could neither come to terms with the 'newness' of the situation nor did they feel at home with the new creative upsurge of Indian construction: "Indian freedom they saw rather as the unchecked opportunities for their enemies to hold them down or indeed to crush them". He concluded that "only in very limited numbers did Muslims evaluate with true appreciation the ideals and announced objectives of the nation to which they belonged".

VI

Evidence marshalled in this paper leads to slightly different conclusions. There can be no doubt that individual Muslims felt weak, fearful, insecure; or that some sections were deeply concerned with their identity and the preservation of their religious and cultural heritage. Yet Islam in India was a living and vital religion, appealing to the hearts, minds and conscience of millions, setting them a standard by which to live honest, sober and god-fearing lives. There was no concerted attempt, despite the stridency of Hindu nationalist forces, to undermine their self-perceived interests as a 'community', though Muslim organisations were inclined to make much of the 'persecution' to which their followers were subjected.

Nehru's government, on the contrary, created a climate that was conducive to the political and economic integration of large numbers of Muslims. It could not have been any better. As a result, "the realisation is growing that they (Muslims) must sink or

swim, and the number of those who find swimming is not too difficult if one decides upon it is gradually increasing". The mood was summed up in 1960 by Maulana Ali Mian, the head of Lucknow's Nadwat al-ulama:

The clouds will disperse, as they are bound to be, and there will be sunshine again. The Muslims will regain the position in the country which is justly theirs. All the schemes for national reconstruction will remain incomplete if they are left to rot and decay.

With this frame of mind, large numbers of Muslims could look ahead with a degree of hope and optimism. "We must not despair of the future", admonished M C Chagla. With more education, with more industrialisation of India, with more social reform, the barriers between the two communities must inevitably break down". It such hopes were somewhat belied, the explanations would principally lie in the breakdown of the secular consensus in the post-Nehruvian era.

Contemporary politics in India is characterised by a preoccupation with communitarian identities, chauvinistic ideologies and movements that divide religious communities and exacerbate differences. Attention needs to be paid to ideologies and movements that have historically and contemporaneously tried to unite Hindus and Muslims and further the post-colonial agenda of social transformation.

A big question remains over the tenability of the approaches and interpretations of liberal and secular-minded Muslims. Doubts have been expressed over their reading of Indian Islam and their thesis on the nature of Hindu-Muslim interaction in the subcontinent. These doubts will stay as long as scholarship on Indian Islam, as also on its adherents, is confined to the realm of speculation and tied to a conventional but stereotyped framework.

What we need today, more than ever before, is to discover new schools of thought and interpretations among Muslims that placed Indian Islam more firmly in its specific Indian environment. I believe the creative intellectual energy, released in the first two decades after independence, was the outcome of a unique 'Indian Muslim' experience of living in a world that was neither Muslim, Hindu nor specifically western. These experiences and their consequences merit serious consideration, and not whether India was a 'dar al-Islam' (land of Islam) or a 'dar al-harb' (enemy territory), or whether pan-Islamism was an ideal or still a living force.

REVIEW OF INDUSTRY DEVELOPMENTS

Cost-Efficiency of Small Manufacturing Enterprises

Implications for Employment Policy

Anuradha Seth

An analysis of the relative cost-efficiency of small manufacturing firms for three industries shows that small firms on average are not profitable units of production and have higher costs compared to larger firms. This article elaborates a framework to examine the cost-efficiency of small firms and analyses data for a sample of small and large firms in three industries: diesel engines, leather footwear and PVC pipes.

THE employment generating potential of small manufacturing firms has been the subject of considerable attention in recent years. Since small firms employ relatively labour-intensive techniques of production (compared to larger, more capital-intensive firms) they are seen as 'appropriate' units of production, especially for labour surplus economies. Hence, calls have been made over the last two decades from different quarters asking for development policy to promote and protect small firms [White 1978; Morawetz 1974; Westphal 1974; Bhalla 1981; Standing and Tokman 1991].

However, the relative labour intensity of small firms is not a sufficient condition for the generation of employment. The viability of small firms in the long run is also of critical importance. In this context, viability refers to the capacity of a firm to survive in the market.

The viability of small firms depends in large part on the nature of their linkages with the market. To the degree small firms act as subcontractors to larger firms, their viability depends in part on the performance of the parent company. In other instances, small firms can well be insulated from competition with other firms. For instance, government policies such as reservation of products for exclusive manufacture by small firms can insulate the latter from competition in which case the determinants of viability might depend on the effectiveness of state policies.

For small firms that are competing in the market, the ability to survive will fundamentally depend on their profitability. If a firm is continually making losses, then after a period of time it will not survive. In this case, employment will obviously be jeopardised.

On the other hand, if a firm is making profits but is not as profitable as other firms because it has relatively higher costs of production, then in the long run, it will not have the financial resources to keep up with investment. In the short run, it will not be able to concede price reductions to consumers and will lose its market share. In either case, its ability to generate employment will be more limited compared to other, more profitable firms.

Furthermore, if small firms have relatively higher costs of production, they will be under continual pressure to seek out ways by which to sustain profits. Costs of production are themselves determined by the technical conditions of production (such as capital-intensity) and by the prices of inputs. If small firms are relatively technically inefficient, they can offset some of this inefficiency by using cheaper inputs, paying very low wages, and by hiring casual and temporary labour.

Earlier we remarked on government policies that insulated small firms from competition. However, government cash subsidies can directly affect the firm's profitability either by diminishing losses or increasing profits. Therefore, it is important to note the degree to which government cash subsidies affect the viability of small firms.

This paper examines the relative cost-efficiency of small, manufacturing firms for three Indian industries. Cost data for this study were compiled from the profit and loss accounts of 32 firms. Our analysis shows that small firms on average are not profitable units of production and have higher costs of production compared to larger firms. Thus, they are relatively cost-inefficient in all three industries, although the degree of inefficiency varies across industries. Since unit costs of production are the measure of a firm's cost-efficiency and hence viability, disaggregating the elements of unit costs points to several important facts:

(1) Costs directly affected by production (wages, material, operating costs) are clearly more important than fixed costs in establishing the relative cost position of a firm.

(2) Of the costs affected directly by production, material costs are the most significant.

(3) Small firms appear to have lower labour productivity and pay lower wages compared to large firms. In fact, the low wages paid offsets to some degree the lower labour productivity of small firms. The ability of small firms to trade low wages for low productivity can affect their unit labour costs and hence their relative cost-efficiency.

As far as employment policy is concerned, wage differentials between small

and large firms should be of particular interest because it seems to suggest that small firms that are in a competitive struggle will have to pay lower wages precisely in order to stay competitive. Since an important determinant of productivity is the technology of production used by a firm, labour-intensive firms will generally have lower labour productivity. Given the necessity for small firms of keeping all costs low, small firms will mostly generate low-paying jobs.

The rest of this article is organised as follows: The first section develops a framework to examine the cost-efficiency of small firms and presents the data sample. Section II presents the data analysis. Finally, the conclusion examines implications of this analysis for employment policy.

I

Earlier we mentioned that a fundamental condition governing the viability of a firm is its profitability which in turn depends on its cost-efficiency in production. Therefore, cost-efficiency is an appropriate indicator of the viability of small, competitive firms [Shaikh 1980; Botwinick 1993:123-72].

The relative cost-efficiency of a firm can be measured by estimating its unit costs of production. Unit costs of production (C) are the sum of unit material, operating, labour, interest, depreciation and rental costs. Alternatively, unit costs can be decomposed into unit prime costs (K) (i.e. cost directly affected by production such as unit material, operating and labour costs) and unit fixed costs (F) (costs associated with the use of fixed capital such as depreciation, interest and rent). Decomposing unit costs allows us to see the relative importance of these two costs. Since unit labour costs are the sum of wages relative to value added, they can also be expressed as the ratio of the wage rate over labour productivity. In this context, the issue of how low wages might offset the low labour productivity of small firms, thereby affecting their relative cost-efficiency will be explored. Finally, our data show the extent to which cash subsidies received from the government can improve the profitability of small firms.

SAMPLE

The history of small firms in Indian industrial development has been examined by several authors [Tyabji 1989; Suri 1988; Sandesara 1988]. Usually, a distinction is made between small firms in the Khadi and Village Industries and small, modern firms. Modern, small-scale units are distinguished from traditional, home-based production units (also known as cottage industry units) on the basis of technology, forms of labour recruitment and markets supplied.

The distinction between these two types of small firms is reinforced by government policy which generally insulates traditional units from competition with large firms. It is by now officially recognised that small, traditional units are on the wane because they are unable to withstand the pressures of competition [Kashyap 1988:667]. On the other hand, modern, small manufacturing firms are the fastest growing set of small firms in Indian industry.¹

In terms of value added, investment and exports, the performance of units in modern, small-scale industry has outpaced the performance of units in traditional industries... handlooms form about 12 per cent of the total number of small units but its share in value added is just 1.5 per cent. At the other end of the spectrum, the share of auto ancillaries is 8 per cent while it constitutes less than 1 per cent of the total number of units [Nagaraj 1985: 1742].

Modern, small firms are also the ones that find themselves in competition with larger units more frequently than do cottage industry units. For this reason our analysis will focus on this set of firms.

Data for this sample was collected during field-work in India (1990-91). It covers 32 small and large firms in three industries, diesel engine, leather footwear and the polyvinylchloride (PVC) pipe industry.² The breakdown of small and large firms in each of the three industries is as follows:

	Small	Large
Diesel engine	9	3
Leather footwear	8	2
PVC pipes	7	3

The sample is not a random one since there is no all-India sampling frame from which a random sample of firms could be drawn, thus the conclusions should be read with caution. Various industry federations, government support agencies (e.g., Maharashtra Small-Scale Industries Development Corporation (MSSIDC), Leather Export Promotion Council, Indian Merchant of Chambers, National Small Industries Corporation, Small-Scale Leather Industries Federation) were contacted and

a list of firms producing the three products was obtained.

PRODUCT AND INDUSTRY CHARACTERISTICS

Diesel Engines: The small-scale diesel engine industry is concentrated in the state of Gujarat, particularly in and around the town of Rajkot. Other important centres of diesel engine manufacturing are the towns of Kolhapur and Agra. Rajkot occupies a place of prominence with an annual output of 3,00,000 engines. In Rajkot, there are around 145 small firms of which 85 manufacture engines bearing the Indian Standards Institute (ISI) mark. Most of the engines manufactured by small firms are used for agricultural purposes. The horsepower range for engines manufactured by small firms generally varies from 3-10 hp and these are mainly used for irrigation purposes (to pump water) by small farmers.

In India, there are three large-scale manufacturers of diesel engines. Although they also manufacture engines for agricultural use, the horsepower range of engines manufactured is much larger, lending themselves for multipurpose use.

Leather Footwear: The small-scale leather manufacturing industry has experienced rapid growth in India largely because of the opening up of export markets and the promotional policies of the state. Most of these units are semi-mechanised units not requiring large amounts of capital investment. Many of these firms are located in and around metropolitan cities like Bombay, Madras and Calcutta. The larger firms are new comers into the industry, having entered the industry after 1978. According to India's industrial policy, a large firm could only be set up if they exported at least 75 per cent of the total output. Many of the large firms are subsidiaries of multinational companies (Pond's, Wipro, Bata, Larsen and Toubro). All firms in this industry produce for the export market with one large firm targeting its output towards the upper end of the export market.

PVC Pipes: Most firms (small and large) manufacturing PVC pipes are located in the western region of India. In fact, this region accounts for 70 per cent of the total capacity for PVC pipes. Most of the firms (small and large) are based in and around the cities of Bombay, Jalgaon, Poona and Nagpur. PVC pipes are mainly used for agricultural purposes such as for irrigation.³

Some authors have argued that product design and quality differentiation can affect the viability of small firms by allowing them to establish a niche in the market. Our sample indicates that small firms in the diesel engine industry produce a lower hp range of engines and in the leather industry, small firms

sometimes produce lower quality shoes. This implies that large and small firms do not always compete with each other for the entirety of their product range and may explain some of the differences in their cost structures and profit margins. The limits of these strategies are however revealed by the fact that in our sample small firms are less profitable than larger ones.

II

Data Analysis

Since unit costs of production (C) are the sum of unit prime costs (K) and unit fixed costs (F), the analysis begins by presenting data on unit prime costs and then factoring in unit fixed costs.⁴ Table 1 presents the average unit prime costs of production for small and large firms. Unit prime costs (K) are the sum of unit material (M/Q), unit operating (O/Q), and unit labour (W/Q) costs.

$$K = (M + O + W)/Q$$

where Q = net sales, M = raw materials used in sales, O = operating costs of production (e.g., fuel, electricity, water charges, sales costs) and W = wage bill (inclusive of employee benefits).

Unit prime cost differentials between small and large firms show that small firms on average have relatively higher unit prime costs of production, although the extent of this differential is greatest in the leather footwear industry where small firms are making losses on average ($K > 1$).

Table 2 presents data on unit prime costs in disaggregated form for all three industries.

The disaggregated data point to the following:

(1) The high share of unit material costs in net sales, which is probably why so much attention has been paid by policy advocates to easing the raw material constraints faced by small firms. In India, in all three industries, special government agencies were set up to help SSE's gain access to raw materials at competitive prices.

In our sample, small firms in the diesel engine and PVC pipe industries have on average substantially higher unit material costs. As small firms operate with smaller amounts of working capital, they are unable to take advantage of buying in bulk when prices are relatively low.

(2) As far as unit operating costs are concerned, small firms on average have relatively lower unit costs of operation, except for the leather footwear units. Since small firms in this industry are producing for export

TABLE 1: UNIT PRIME COSTS OF PRODUCTION

	Small	Large
Diesels	0.98	0.92
Leather	1.07	0.95
PVC pipes	0.97	0.94

markets, they incur relatively high sales, marketing and advertising costs leading to higher operating costs compared to small firms in the other two industries.

(3) Unit labour costs present an interesting picture. Only large firms in the diesel engine industry have higher average unit labour costs as compared to their smaller competitors. In order to see what accounts for these results, unit labour costs can be decomposed into the relation between the wage rate and labour productivity (which is now defined in terms of value added). Thus, $(W/L)/(VA/L)$ where L = full-time equivalent number of employees.

$$(W/L) = \text{wage rate} = w$$

$$(VA/L) = \text{labour productivity} = q$$

Unit labour costs are therefore determined by wages and by labour productivity. Labour productivity generally tends to be affected by the technical characteristics of production (capital intensity of production). Earlier we argued that firms which were technically inefficient, had low labour productivity, could still be relatively cost-efficient if wages were very low. Tables 3 and 4 present the data on average wage rates and the average rates of labour productivity for small and large firms.

The data show that even though small firms have relatively lower wages and lower levels of labour productivity, it does not automatically imply they have relatively lower unit labour costs. This is because lower wages can sometimes only partially offset lower productivity. Examining this for the three industries, the data show:

Diesel Engines. Even though small firms are much less productive than larger firms (38 per cent as productive as large firms), their lower wage rates (small firms pay only 26 per cent of the wage rate paid by larger firms) more than compensate for productivity differentials. This is what accounts for their lower unit labour costs.

Leather Footwear. Small firms are much less productive than larger firms (they are only 26 per cent as productive as larger firms). However, their wage rate is 39 per cent of that paid by larger firms. Thus despite a substantial wage differential, the lower levels of labour productivity cannot be compensated for resulting in higher unit labour costs on average for small firms.

PVC Pipes. Small firms cannot compensate entirely for productivity differentials by paying lower wage rates, so that their actual unit labour costs are on average higher than those for larger firms. The data shows that the average level of labour productivity in small firms is only 20 per cent of that found in larger firms (which follows because small firms in this industry are also much less capital-intensive).⁶ However, small firms pay 80 per cent of the wage rate paid by larger firms. Incidentally large firms

in this industry also pay the lowest average wage rate of large firms in all three industries.

The point of this exercise was to show that larger firms in all three industries have higher levels of labour productivity that are generally associated with technical advantages such as, economies of scale. For small firms, lower wages become a necessity if they are to try to remain cost competitive. The logical implications of this have not been sufficiently developed in the literature because if competition is understood in a dynamic sense, then this analysis indicates that small firms will be under continual pressure to keep wage costs low if they are to remain competitive. In fact, the very process of competition will ensure the persistence of wage differentials even though the wage differential might not be sufficient to make small firms cost-efficient as is the case in our sample for the leather footwear and PVC pipe industries.

If wage differentials do allow small firms to be relatively cost-competitive, then large firms in a bid to retain their competitive position could also resort to the increasing use of casual and temporary labour, in order to lower labour costs (as casual labour does not receive employee benefits and are usually paid lower wage rates compared to 'permanently' hired workers). In fact, this trend by large firms has already been noted for Indian industry [Deshpande and Deshpande 1992: 2248-52].

Another point to remark is the extent to which costs directly associated with production already determine in the first instance the relative cost-efficiencies of firms.

Table 5 presents disaggregated data on the elements of unit fixed costs. Table 6 presents the average unit costs of production for small and large firms in the three industries.⁸

The data shows that small and large firms have more or less similar unit interest costs; there is no clear evidence of small firms facing relatively higher unit interest costs, as has been generally argued in the literature. As far as depreciation costs are concerned, small firms in the diesel engine industry have negligible depreciation costs because most small firms organise production by assembling components and therefore work with very little capital equipment.⁹

Data on average unit costs shows that small firms are incurring losses in the leather footwear and PVC pipe industries. Further, in all three industries small firms are on

average relatively cost-inefficient. While examining unit prime costs, we observed that small firms in all three industries were relatively cost-inefficient and now we find that factoring in the elements of fixed costs has aggravated the relative cost-inefficiency of small firms in the leather and PVC pipe industries.

If factoring in fixed costs results in small firms being relatively cost-inefficient, then how do we account for their continued existence in competitive markets? It is in this context that the role of government subsidies and incentives towards the small-scale sector becomes relevant.

Government Incentives. The array of incentives extended towards small, modern enterprises is complex to say the least.¹⁰ In part this is because the size and composition of incentives vary depending on the following factors: industry to which the firm belongs; location of the firm, whether located in officially designated 'industrially backward areas' or not; whether the unit is an export oriented unit or not; date of establishment and a host of other such considerations.

Another reason for the complexity of these incentives is due to frequent changes in government policy. Briefly summarised, it can be said that incentives fall under the following categories: (a) raw material supports; (b) marketing supports; (c) training facilities; (d) access to credit.

Most of the incentives listed above are designed to promote the competitiveness of these firms. On the other hand, protectionist policies like the reservation of products for exclusive manufacture by small units are aimed at insulating small firms from competition. Only those incentives that

TABLE 3. ACTUAL LABOUR PRODUCTIVITY (Full-time Employee Equivalent)

	Small (Rs)	Large (Rs)	S/L (Per Cent)
Diesels	57,871	1,49,508	0.38

TABLE 2. UNIT PRIME COSTS

	Unit Material		Unit Operating		Unit Labour	
	Small	Large	Small	Large	Small	Large
Diesels	0.87	0.66	0.07	0.16	0.03	0.08
Leather	0.70	0.71	0.24	0.19	0.12	0.03
PVC pipes	0.89	0.72	0.06	0.21	0.01	0.008

affected the cost-efficiencies of firms in our sample will be examined.

Leather Footwear Industry: Since all the firms in the sample (small and large) were 100 per cent exporting units, they could avail of government export subsidies which amounted to approximately 20 per cent of the value of sales.¹¹

Table 7 shows the difference between stated profits and profits on production for firms in the leather footwear industry.¹² The difference is entirely due to subsidies. During field-work, many proprietors claimed that these subsidies constituted their profit margin and so it was crucial that they be continued by the government. Interestingly though, one of the large firms in the sample argued otherwise, claiming that they "were not in favour of any cash compensatory support as it does not help the manufacturer in the long-run to achieve global competitiveness".

It should be pointed out that with the New Economic Policy adopted by the Indian government in late 1991, all export subsidies were eliminated. The implications given our analysis should be quite obvious. We would expect to find a high rate of firm insolvency and closure in this industry, although the impact of rupee devaluation on exports would have to be taken into account. In addition, all export units were exempted from paying taxes on profit, and could avail of duty drawback and the replenishment licence.

PVC Pipe Industry: Some of the incentives that would affect the viability of small firms in this industry are the price purchase preference policies of the Indian government which give small firms a 15 per cent margin (advantage) in the pricing of their output compared to larger firms. Since the state is also a consumer of PVC pipes, a certain share of the output is reserved for purchase from the small-scale sector at prices that could be up to 15 per cent higher than those quoted by larger firms.

In addition, all small firms are exempt from paying sales tax (100 per cent tax free on sales and purchases up to the amount invested in fixed capital). Many proprietors of small firms claimed that exemption from sales tax allowed them to quote selling prices that were 2-8 per cent lower than what they would otherwise have been. Other incentives such as income tax exemption (which was 20 per cent for small units) also depended on whether the unit was located in an 'industrially backward' area. If it was, it could apply for a further 20 per cent exemption from income tax.

Other incentives that would affect the cost-efficiency of small firms were exemption from paying taxes on electricity.

Diesel Engine Industry: The most important incentive extended by the state is indirect. Since most engines produced by

small firms are used for agricultural purposes by small farmers, NABARD (the national agricultural bank) provides small farmers with loans at subsidised rates for the purchase of these engines. Since the loans are generally given for the purchase of engines up to 5 hp capacity, much of this output comes from the small scale sector. As one proprietor stated, "our business depends on government loans to the farmer".

In addition, small units get a 30 per cent subsidy on excise duty for electricity consumption, raw materials (pig iron, coal) at subsidised rates through government agencies, and there is a purchase price preference policy of 20 per cent of the FOB value.

Although these 'indirect' incentives are impossible to quantify, they are nonetheless 'hidden' in various corners of the accounts of firms (e.g. subsidised price of raw materials, protected market share, subsidised interest rates). Thus, the importance of these indirect subsidies as factors that affect the viability of small firms should not be underestimated.

III

Conclusion

The fundamental weakness of small-scale production stems from its small size, which prevents small firms from benefiting fully from economies of scale – technological and pecuniary. They are, therefore, cost inefficient, relative to large units. Further, the latter pass on at least a part of the benefits accruing to them from economies of scale, in the form of a cheaper price, so that in the market place small units are handicapped – especially where they have to compete with large units [Sandesara 1991:2425].

This paper found small firms to be relatively cost-inefficient in all three industries. Prime costs were found to be more significant than fixed costs. Curiously, the difference in fixed costs between small and large firms was not of much significance. Of the costs directly associated with production, material costs were quite a substantial element affecting the relative cost-efficiency of a firm.

The relative cost-efficiency of small firms also depended in part on their ability to trade productivity differentials with wage differentials. The data show that small firms were not even half as productive as large firms. Their technical inefficiency stems in large part from their technology of production and their inability to capture economies of scale. Small firms in the diesel and PVC pipe industries were not even 25 per cent as capital-intensive as large firms, and small leather firms were not even half as capital-intensive as compared to the larger firms in the industry.

In order to compensate for their technical inefficiencies, small firms paid very low wage rates. However, only small firms in the diesel industry succeeded in offsetting their low productivity by paying very low wage rates, which resulted in relatively lower unit labour costs.

We then pointed to the role of government incentives and subsidies showing how they directly or indirectly affected the viability of small firms. In fact as far as the leather industry was concerned, both small and large firms remained viable on account of government subsidies. Even so, small firms were less profitable than large ones.

Despite considerable state subsidies, there is nonetheless widespread evidence of insolvency among small-scale enterprises and high mortality rates are characteristic of the small industries sector. "The number of sick small-scale industrial units increased from 1,18,000 units at the end of December 1985 to 1,46,000 units at the end of December 1986. By June 1987, there were a total number of 1,60,000 sick small-scale industrial units" [Government of India 1988].

Additionally, the outstanding bank dues of these units increased from Rs 1,071 crore

i	11551079	6023402
K*	46470000	47960000

* These are profits for a large firm

in 1985 to Rs 1,306 crore in 1986. By June 1987, the outstanding bank dues amounted to Rs 5,737 crore [Government of India 1989-90].

This analysis has shown that to the degree modern, small firms are cost-inefficient, they will not be viable units of production unless they are subsidised either by the state or by the low wages of labour. The analysis further implies that if subsidies were eliminated, these firms would find it difficult to survive competitive markets in the long run. If they are not viable, the implications for employment are obvious.

If the wages paid to labour improve the cost-efficiency of small firms, then the following implications for income distribution policy need to be noted. Wage differentials between small and larger firms along with the massive 'reserve' of labour in the subcontinent implies that these could be a downward pressure on already low wage rates, as well as a pressure for larger firms to constrain increase in their wage rates if they are to remain competitive. To conclude, our analysis indicates that the employment generating potential of small firms needs to be questioned rather than assumed by the advocates of small firms.

Notes

- 1 At the time of this study (1990-91), a small-scale enterprise was defined as an industrial unit with investment in fixed assets in plant and machinery whether held on ownership terms or by lease or by hire-purchase not exceeding Rs 35 lakh. In the case of ancillary units investment in fixed assets could not exceed Rs 45 lakh.
- 2 The initial sample list contained 68 small and large firms. But, as has been frequently noted by others conducting field-work the difficulty of gathering cost data from firms should never be underestimated. Since the cost data was compiled by using firms' profit and loss accounts, balance sheets and a detailed questionnaire, we frequently encountered resistance from proprietors who were reluctant to divulge this information citing fear of tax authorities, competition, etc. Hence, complete cost data could only be collected for 32 firms. For the 'hazards' of conducting field-work, see also Sandesara (1982) and Mohanty (1986:19).
- 3 Product groups rather than industries were chosen to ensure product homogeneity (insofar as it is possible). This is a necessary condition if one is looking at the issue of competition within industry.
- 4 It is important to mention that another factor affecting unit costs of production are rates of capacity utilisation. Since, consistent data on installed capacity and actual capacity use were not available, we did not explicitly adjust for this factor.

However, the affect of capacity utilisation was minimised by adjusting material costs of production in that only material costs used in production were computed as opposed to materials purchased. Further, capacity utilisation affects unit fixed costs more significantly than unit prime costs, and our data show that unit fixed costs are not a substantial component of the unit costs of production.

- 5 The number of employees (L) was adjusted for firm-specific differences in number of days worked per year, number of shifts operated per day, length of shifts and the use of casual labour.
- 6 The average capital-intensity (K/L) for small and large firms is as follows:

	Rs Per Employee		S/L
	Small	Large	(Per Cent)
Diesel engines	8624	55825	0.14
Leather footwear	6423	14664	0.43
PVC pipes	90145	391857	0.23

- 7 "It is striking to note the way average earnings increase steadily as the size of enterprises becomes larger and larger. There may be various reasons for this. It may be a reflection of greater bargaining strength of workers, greater availability of capital and so on." Roy and Mukherjee [1989:2675]
- 8 All unit fixed costs are in terms of net sales.
- 9 Depreciation is computed at historical cost. In times of inflation, this method of estimating depreciation underestimates the actual cost of replacing equipment. On the other hand, firms will depreciate on the books as fast as tax laws allow them to which in turn would exaggerate depreciation as compared to what is economically warranted. So, in sum, it is not clear in which direction the bias is created when using the book value of depreciation that has been calculated at historical cost.
- 10 Since 1991, with the New Economic Policy, several changes have been made with respect to incentives offered to small firms.
- 11 The subsidies accounted for here were cash compensatory support which was 20 per cent of the fob value at the time of the survey.
- 12 Only firms that recorded (in their accounts) the amount of subsidies actually received have been listed here. Since the leather footwear industry has been targeted as an export industry, at the time of the study all exporting firms regardless of size could avail of cash compensatory support and duty drawback which are both computed on the volume of sales and not on value added. Consequently, during field-work we observed a few firms who subcontracted production, did the finishing in their factories, sold the product and became eligible for subsidies, despite the fact that actual production had not been conducted in-house.

Market and Non-Market Configurations in Rural West Bengal

Local Organisations and Silk Weaving

Debdas Banerjee

The current trend towards a diminished role of the state in third world economic activities including rural development has stimulated a 'new' paradigm which reasserts new opportunities for local organisations and institutions. This is a case study of silk production, a highly labour-intensive activity predominantly dependent on family labour in West Bengal. It examines the forms of organisation, the labour force, and various market and non-market configurations that determine the trend of development with particular reference to the role of local organisations and the state.

I

Introduction

THERE has been a steady growth of sericulture in developing countries since the mid-1970s. Silk production is a labour-intensive activity especially in its initial agricultural phase. Thus, sericulture has either disappeared or is on the wane in most developed countries, most recently being in South Korea, due to high opportunity cost of labour and simultaneously to price competition from low-wage silk producing countries. In recent times, the decline of the production particularly in Japan, has made India the second largest raw silk producer. Her exports increased from Rs 2,550 million in 1987/88 to Rs 7,891 million in 1993/94 (i.e., at the annual trend rate of growth of 17.01 per cent). The exports to the US alone constituted about 36 per cent of the aggregate value of Indian exports in 1993/94 while the US, the UK and Germany together consumed more than 63 per cent. West Bengal is the second largest producer of silk in India, and roughly about 30 per cent of its mulberry silk output is being exported abroad.

Agricultural productivity (particularly, of the major crop, i.e., rice) in the state has slowed down from the rate that it achieved during the 1980s.¹ The organised manufacturing has been experiencing stagnation [Banerjee 1982, Banerjee and Ghosh 1988]. Important rural industries like brass and bell-metal, products of conch-shell [Ghosh 1994; Dey, 1993] have also lost their potential to absorb a sizeable part of the growing rural workforce. Perhaps the trading in land-based commodities is the only area where additional employment is generated. The growth of the mulberry silk production thus assumes significance, apart from others, as part of the poverty alleviation programme.

Mulberry silk production in West Bengal has a long history. The colonial policy of free import of raw silk from China and Japan, and overlooking the domestic industry

that eventually resulted in a 'seed'-borne and generic disease called 'pebrine', almost wiped out its production in the state, by the beginning of the 20th century. War-time demand during the second world war marginally saved the industry while noticeable improvement began only in the early 1970s.

Silk is produced, in the countryside and in rural towns, in several stages – mulberry cultivation, silkworm rearing, reeling and spinning of cocoons (yarn production), twisting of the yarn and ultimately weaving. All these are predominantly family-based domestic activities, and the traditional methods applied in different branches of production are labour-intensive. The districts in which the rearing and reeling activities are mainly located, have a comparatively high percentage of wage-labour to the aggregate rural workforce. Moreover, these two branches of silk production are largely dominated by 'backward' castes who together constitute the bulk of the jobless people in the state. The 'crop' schedule (usually, five seasons in a year) does not overlap with the schedule of the staple foodcrops, in the state. Thus, apparently, the availability of wage-labour in mulberry cultivation, rearing or reeling activity is not a constraining factor. On the other hand, the rate of return per unit of land is found to be highest in mulberry cultivation (alongwith rearing) among the major crops grown in the state. Yet, the growth of the sector remained practically stagnant [Banerjee 1990]. The rate of diffusion of improved technology in any branch of production is extremely low. Moreover, upward mobility is restricted; there are only a very few instances of household enterprises getting transformed into an establishment.

The Central Silk Board, government of India, assisted with an International Development Agency (IDA) credit of SDR 113.8 million (US \$ 147 million, which was subsequently enhanced) and a Swiss Development Co-operation grant of SwF 40

million (US \$ 25 million), has been implementing, in addition to the routine programmes, a sericulture development programme in five key states in India including West Bengal, since 1989. There are public R and D institutions entrusted with the job of technological improvements in the sector, and a few government-sponsored autonomous marketing agencies for the weavers' products. Yet, commercialisation has failed to acquire marked traits in silk production as a whole, in West Bengal.

The earlier Gandhian ideology of giving support to the rural craftsmen towards the desired goal of swaraj [for discussions of Gandhi's ideas as they relate to economics, see Datta, 1978] was later integrated to the development strategy that came with the Second Five-Year Plan. The content of the small industries policy in the post-independence period, however, reveals that the spirit of Gandhism was abandoned [Tyabji 1989]: the ideal of clothing village population with khadi (briefly, the outputs of rural craftsmen in traditional looms) has been replaced by production of commercial khadi. The khadi and village industries are supported by substantial allocation of Plan funds which included, until recently, interest-free loans, subsidies and rebates, and grants for a larger administrative, supervisory and technical personnel. And, the actual implementation of the development work at the grass-roots level is carried out by the registered societies.

The current trend towards a diminished role of the state in third world economic activities including rural development activities has stimulated the 'new' paradigm of development economics that reasserts new opportunities for local organisations and institutions (LOIs) [see, e.g., Nugent 1993; de Janvry et al, 1993a; Thorbecke 1993; Uphoff 1993]. The LOIs are being considered, in the literature, as potential substitutes for either state or market failures. In fact, many traditional LOIs for production, marketing or for both,

historically originated where the state was virtually non-existent and markets were imperfect and incomplete. But, was it patchy state intervention, and/or lack of market adjustment, or the internal organisation of production itself, which contributed to their failure in a later period?

Hardin's (1968) 'tragedy of the commons' states that, in the case of commonly owned resources, each individual has the incentive to overuse the resources, regardless of what others do, thereby leading to the destruction of these resources. Only strong and appropriate intervention by the state, according to Hardin, could save the situation. The neo-institutional analysis of LOIs attempts to dismiss Hardin's contention using game theory, but has yet to come out with a definite solution. In these models, monitoring is still crucial. If mutual monitoring is not possible, the monitoring should be by agents accountable to the members. And, as the size and heterogeneity of LOI membership grow greater hierarchy may be necessary [Nugent 1993]. A norm of fairness which allows the actions to be sequential and everyone to adopt the behaviour taken by others, however, would have been the acceptable rule of the game in a Chayanovian economy [Chayanov 1987]. One perhaps cannot rule out the rise of the 'economic man'. And that renders mutual monitoring, or a fair monitoring by an agent, accountable to the members of the LOI, archaic, particularly after the globalisation of the domestic 'traditional' economy.

Our case study is primarily based on data gathered from the survey of the three most important weaving centres, viz, Bishnupur (in the district of Bankura), Mirjapur and Chawk-Islampur (both in the district of Murshidabad), during 1993-94. The outputs of these three centres include almost all of the varieties, known as the 'Bengal varieties', available in the market. However, each centre has its own distinguishing characteristics particularly in regard to the organisation of production and the output-mix. The produced silk materials can broadly be classified into high, medium and low-valued items. Bishnupur is famous for its high valued (HG) designed sarees known as 'baluchari'. Mirjapur's products are usually medium valued (MG) and typically stand for the popular 'Murshidabad silk'. And, Chawk-Islampur specialises in relatively standardised low valued (LG) reeled silk fabrics; of late, it has become a growth centre of spun, and spun plus reeled silk fabrics which has been experiencing growing markets at home and abroad. In the next section we analyse the forms of organisation, the labour force and various market and non-market configurations that determine the trend of development. The

final section summarises the conclusions of the paper.

II The Weaving

The HG silk materials viz, 'baluchari' sarees, famous for its brocaded designs and richly coloured borders are produced on the relatively high-efficient Jacquard looms¹ (throw shuttle type). Most of them are of 19th century vintage from Manchester, but are still in operation. To note, the loom is predecessor to the computing machines in a big way, and is accomplished with weaving designs simultaneously. On the other hand, almost all of the MG and LG materials are produced on the ordinary traditional wooden looms, excepting for a very few cases of Jacquard loom use. The technological superiority of the latter loom to the ordinary country looms are: first, the ordinary loom is capable of producing only indelicate designs. Second, the motion required to be imparted to the heald by means of a treadle (the 'shedding motion') being operated by the movement of the legs inside the pit is less frequent in Jacquard as compared to that in an ordinary loom, and which reduces the labour-time of the weaver. Whereas 10-12 treadles in an ordinary loom are used for developing designs on silk materials the Jacquard use one or two treadles for the same purpose. Third, the Jacquard minimises costs on account of loom-setting (warping) since a particular type of fabric is produced in relatively larger volumes. An ordinary loom, on the other hand, remains inoperative for a couple of days in-between the completion of a 'batch' and the beginning of the next 'batch'. The warping for a batch of production is quite labour-intensive. And the Jacquard has the advantage that it can be set with such a volume of warp that enables the weaver to a continuous operation for about six months.

However, besides machine costs, the high initial capital requirement in Jacquard restricts its uses to HG which at present have a stable market. The costs of design-making, transferring the designs on to the cards by the system of punching, manually and by a crude punching instrument, and the costs on loom-setting (warping, shedding,⁴ etc) with a huge volume of yarn make it quite prohibitive for the common weavers. Even those who could afford that usually use the same design for a very long time (generally for five to six years), in order to bring down the per unit cost of production. The common weavers, however, produce varieties of MG and LG fabrics, from the complicated designs to the plain, on ordinary looms. Interestingly, there is a discernible trend of spatial concentration of production of different 'grades' of materials, and corresponding

pattern of production organisations, wages and labour utilisation, etc.

There are broadly two types of entrepreneurs, apart from independent weavers, in silk weaving, viz, (a) those who undertake weaving only, and (b) those who own reeling/spinning units and also put out work to domestic weavers. The former comprises the societies, and the local private silk merchants (PSMs) while the latter only the societies. In other words, the local PSMs have not usually developed vertical integration. The societies are not, strictly speaking, weavers' guilds. There are two types of societies, (a) the co-operative which are formed by the members who are equity holders, and where the net profit shall be distributed among its members, and (b) the charitable societies which are formed by seven or more individuals. To note, most of the latter type of societies engaged in weaving and/or reeling are found to have been floated with members who are closely related and thus largely constitute family-based business organisations, as opposed to the co-operative societies. All these societies are certified by either the Khadi and Village Industries Commission (KVIC), government of India, or the Khadi and Village Industries Board (KVIB) in respective states in India. Under the stipulation, all the KVIC/KVIB societies are supposed to organise the backward linkages – reeling/spinning – under their own umbrellas, and only in exceptional cases are they entitled to buy yarn from outside but that too from the certified societies. At present, there are only 18 co-operative (silk producing) societies as against 247 charitable societies, in West Bengal.

The production organisation of the PSMs, on the other hand, may appear as that of a master and weaver but, in fact, it is a merchant's organisation based on putting-out system. Unlike the weavers under the societies (who are entitled to different schemes of Artisan Welfare Fund (AWF)), the weavers under these private putters-out do not enjoy any kind of social security benefits. The investment portfolio of the PSM changes quite frequently depending upon the market conditions. Although they carry out trading in silk yarn and finished materials, and also assume direct role in the production of silk materials, the share of the respective activities changes quite frequently. By dint of the system of putting out they are able to change the output mix according to market signals.

On the other hand, the majority of the silk weavers work on their own looms in their own houses, using materials obtained from the society, or the PSM. And, they use to receive piece-rate wages from the putters-out. Thus, in this type of production organisation the key role is being played by the agent who actually put-out the work to

the individual weaver. There is no powerloom in the state. Moreover, such phenomenon as that a master-weaver having a number of looms, employing journeymen and apprentices is nondescript, except in the HG producing Bishnupur. The head of the family is normally responsible for the execution of the work obtained from the putter-out, and the 'subordinate' members of the family, i.e. the women, children and old people are being organised by the 'head' in an informal manner to ensure the completion of the work. For the subordinate members, however, this is a domestic by-occupation; the other adult male members also take part in weaving. Most of the jobs of processing of the yarn (degumming, bleaching, colouring for the coloured fabrics, and winding the weft) are normally being done by other members including the children. The weaver, however, by dint of his ownership of tools is not an 'independent manufacturer', any more like an agricultural labourer who owns a sickle. The 'independence' of the weaver who owns a loom and also work with owned raw materials (i.e. yarn, etc) is largely subjected to the conditions of the output market. It is the silk merchants who provide marketing channels for most of the outputs by otherwise independent weavers. Accordingly, the weavers would be stratified in order of their specific entitlement to income. The socio-economic conditions of the weavers, as a whole, have become more vulnerable since generally they are divorced from agriculture. The joint-production of agriculture and the domestic 'industrial' goods seems to have negative impact upon productivity, yet how far de-peasantisation turns out to be worthwhile is interesting to study.

The HG silk materials have been experiencing brisk demand from mainly urban elite consumers for about last ten years. As a result there is large scale switch-over from other types of silk goods to this particular line of production in Bishnupur. There are altogether one charitable and three co-operative societies. However, few of the weavers are found to be associated with them. The participation of the PSMs, on the other hand, is virtually limited to trading in finished products. The independent weavers overwhelmingly depend upon these PSMs. There are a few master-weavers who own a number of Jacquard looms and operate these with the journeymen and apprentices. They, too depend on the PSMs for outlets of the products. Moreover, the transactions are wholly made on credit, which put the otherwise independent weavers on the receiving end.

The distinguishing characteristics of HG production is that the labour-time required for pre-weaving processing (yarn processing, winding, warping, denting, healding,

drafting, etc) is almost two-and-a-half times greater than that in actual weaving. Added to these is the considerable period of time required for fixing a 'design' (on punch-cards) to the Jacquard loom. But since the same design is reproduced on a large number of sarees for a couple of years, the apportionment per saree becomes negligible. Most of the jobs of pre-weaving processing, apart from loom setting, are done by either unpaid family members mainly women, or under-paid (as compared to agricultural wage rate) hired labourers. The current steady demand for the outputs, in turn, has generated a steady number of person-days of employment and resulting in the availability of hired workers at relatively lower wages, in pre-weaving processing, in particular. Baluchari is primarily a non-traded commodity. And in the domestic market, though it fetches a premium for its exotic variety and, up to a certain range, the price-elasticity is low, the market is undoubtedly volatile. The output market, as envisaged by many who are directly related to the sector, is perhaps approaching the demand saturation level unless the products are differentiated. But the latter would imply a hike in the cost of production unless the technological conditions are changed. For instance, computer aided design (CAD) would not only accelerate the process of designing but would also greatly reduce the card-punching time. As the cards could be easily duplicated, the aggregate cost of developing designs would be shared by the weavers. The steady market, notwithstanding the weavers' income, on an average, is not much above the subsistence level, and that tends to reduce the flexibility of the system of production. The lack of flexibility makes it prone to high risk and uncertainty during external shocks. It is not that the weavers are not aware of the risks and uncertainty. But the kind of entrepreneurship that would have brought them out of the low level equilibrium is not there, not simply because they are poor but also due to the lack of supporting financial infrastructure. Their dependence on the private moneylenders for working capital who most of the time turn out to be the PSMs, 'tie' them in a contractual bondage which appears to be quite unfavourable to increasing the productivity.

The MG and LG materials, on the other hand, are largely traded goods and together constitute the bulk of the aggregate production in West Bengal. The overwhelming majority of the weavers in these lines of production work under the putting-out silk merchants and/or, the societies. There is a relative dominance of the PSMs in MG production (in Murjapur), and of the societies in LG. The societies are neither unable nor unwilling to produce MG varieties. In fact, the quality of materials being produced by

the society is usually superior to that of the PSMs, since the quality of yarn, particularly the weft, supplied by the PSMs to the weavers is inferior to that of the society. Moreover, the amount of yarn used per unit of fabrics varies. Usually, the amount of yarn in the PSM produced fabric is less than that of the society's. The PSMs reduce the volume of yarn per unit of fabric further as soon as the yarn price goes up to manipulate the costs of production of the relatively higher price-elastic fabrics. Besides, the wages paid by the silk merchants are also comparatively low while the society pays, say Rs 400 for a piece of 'jamdani', or Rs 406 for a 'kanal' the silk merchants pay Rs 225-300, and Rs 273, respectively. Moreover, unlike the PSMs, the society reimburses the costs incurred by the weaver on bleaching and colouring materials. The PSMs also enjoys an additional advantage of flexible wages, unlike the society whose wage rates are fixed by the apex body. The PSM usually does not increase wages when the market prices of the fabrics increase but a rising cost of yarn is otherwise generally being counterbalanced by a reduction in the wage rate. Finally, weavers under the PSM are not covered under any social security scheme. Yet, the PSMs dominate the sizeable part of weaving largely by dint of their easier access to loan funds, which provide short-term consumption loans at free of interest to the weavers.

As compared to LG, the MG fabrics contain more yarn and more labour-time, as well. The societies, particularly the co-operatives, with their limited volumes of working capital in relation to the numbers of artisans under their fold rather prefer to have more frequent circulation of the available capital than on concentrating in the longer 'gestation' areas, even if the profitability is higher. The drawbacks of the society further get accentuated due to the fact that the PSMs put out warp, at a time, in quantities which are required for at least nine to 10 standard lengths of fabrics. Mainly to manoeuvre the weavers, the societies also have to put out similar quantities of yarn, at a time, to a single weaver while due to resource crunch they may not be able to provide adequate person-days of employment to all the members. Thus, elements of discrimination and discontent breed in the co-operative organisation, leading to disintegration. The reason closely follows Hardin's hypothesis (1968). The demand for, the commonly owned resources, i.e. the yarn, by each member-household is determined by the number of looms owned while, in the short-run, the supply capacity of the society is restricted by the access to working capital. The greater the numbers of looms owned by individual households the quicker is the turnover, and hence relative overuse of

SAGE

RESOURCES IN MANAGEMENT & ORGANIZATION

EVALUATION OF ENTREPRENEURSHIP DEVELOPMENT PROGRAMMES

**DINESH N AWASTHI
and JOSE SEBASTIAN**

This book assesses the efficacy, degree of success, and the contribution of entrepreneurship development programmes in India. It delineates the factors contributing to the success or failure of such programmes, and evaluates the role of support agencies with reference to the promotion of first generation entrepreneurs through EDPs.

ORGANIZATIONAL ETHNOGRAPHY

**An Illustrative Application in the
Study of Indian R&D Settings**

V SUCHITRA MOULY and JAYARAM K SANKARAN

This is an in-depth, micro-level, qualitative study of Indian R&D settings utilizing a relatively new qualitative paradigm of inquiry into organizations. The book begins with a comprehensive introduction to the methodology of ethnographic research and goes on to critically examine the advantages and disadvantages of survey and ethnographic research methods.

THE CULTURAL CONTEXT OF LEADERSHIP AND POWER

JAI B P SINHA

The major concerns of this book are to identify effective styles of leadership, the constructive uses of power, and how a synergetic work culture can be built within an organization. The concepts of leadership and power are historically traced, western theories of these concepts fully detailed, and newly emerging theories from Japan and India examined.

resources by them. The cost burden of collective action thereby falls more disproportionately on the poorer households having fewer looms, leading to income inequalities. The relatively skilled weavers, those who are in search of stable employment or a longer periods of time, have naturally mobilised around the PSMs despite comparatively low wage rates and the absence of social security.

We have tried to estimate the monthly wage income per loom on the basis of full-capacity supply of yarn and the human-capacity of the weaver (i.e., the normal working hours per day, usually from dawn to dusk). The volume of labour varies with the variety of fabric. Yet, on an average, the full-capacity monthly wage income per household under the society turns out to be about Rs 1,200 while that under the PSM does not exceed Rs 900. In fact, the monthly income per loom is found to be even less, largely because of the output-mix of individual households. Increase in the number of looms to enhance household incomes may seem feasible but not viable, in most of the cases. The average family size of the household is found to be six. While the adult male members operate on the loom, others are engaged in unpaid pre-weaving processing jobs. The latter alone takes about 32-48 hours per piece of standard sized cloth, depending on the variety of fabric, while the weaving consumes 27-78 hours of labour (paid). And, on an average, the subordinate members spend about five hours in a day on the pre-weaving processing work. This informal intra-familial division of labour is the support-base of this particular production process. The weaving capacity is, thus, strictly restricted by the supporting hands. When the per loom monthly income of the weaver households hovers around the poverty line², the hiring of wage labour does not seem to be economically viable. Hiring of weaver also means subsidising the wage out of the family income since the pre-weaving processing required for the additional loom does not get paid. The low wage notwithstanding they have no effective union against their masters reflecting their weak bargaining position. Because of their poverty they feel little temptation to migrate, also. The additional advantage in the handloom weaving industry is that it serves largely to occupy part of the family for part of the time: father, mother and children could all share in the work which would be carried on in the home itself. However, their current plight if seen as the sacrifice of current consumption for a better future is hardly likely to be redressed since the PSM's competitive advantage over the society's is not based on superior technology. If the output market was non-discriminatory, PSM products would have been considered as

distinctly different from that of the society's. In fact, inferior products from the PSM's competitive advantage as against the society is not based on superior technology. It is very likely that the inferior products from the PSMs would slowly render the otherwise traded goods as non-traded ones.

The societies, on the other hand, are concentrated in the production of more or less standardised and relatively low-valued plain silk cloth. The place named Chawk-Islampur is a case in point where about one-fourth of the state's aggregate annual production of raw silk is being consumed. Most of the weavers there are dependent upon the five co-operatives and 27 charitable societies. The co-operatives are relatively large in size, the smallest one with a membership strength of 118 while the largest one, 403 weavers. Charitable societies are smaller with the number of artisans varying from 15 to 25. The production in Chawk-Islampur consists of cloth of both, exclusively reeled and spun silk yarn, and of various mix of the two types of yarn.

The relative advantage of the societies in LG production are: (a) fewer labour-hours are required for weaving as compared to HG or MG, and hence shorter 'gestation'; (b) the raw material costs are also significantly lower than for MG production; and (c) the wage cost per piece of cloth is also much lower. All these put them in a relatively better financial position and enable them to provide relatively more person-days of employment per weaver. Thus, it has become very difficult for the PSMs, with lower wages and no social security scheme, to penetrate. But what matters is that the charitable

societies almost work like the PSMs, and the operation of the co-operative societies are not always transparent.

There is a definite swing in favour of the production of mixed (spun plus spun, or reeled plus spun) yarn fabrics which now find a growing export market. The reasons being, first the average aggregate cost of production as a ratio of retail price in mixed yarn fabrics tends to be much lower than the 'pure' silk fabrics (Table 1). Secondly, the retail price less the costs (i.e., value of yarn, weaving wage including AWF and ex-gratia, and the cost of design printing), that is, the surplus produced per hour of labour is far greater in the case of mixed fabrics than that in pure reeled, or pure spun silk fabrics, number of reeds remaining the same. The 'quick' turnover and involvement of less amount of working capital per unit make the mixed fabrics production relatively profitable to the otherwise capital scarce societies.

However, the rising demand for spun yarn has not resulted in the rise of relative price of spun as compared to the reeled yarn. The co-operative/charitable societies are supposed to produce spun yarn on their own with the members/employing local labour force. However, almost all of the spinners are found to be self-employed incidentally, almost all of them are women. And, the difference between the stipulated costs at which the societies are supposed to produce and the prices at which the self-employed spinners sell their yarn in the local market or indirectly to the societies, is as high as Rs 80-120 per kg (depending on the counts of yarn). The oligopsonist societies and the 'unauthorised' buying agents of those

TABLE 1. PRODUCTION ORGANISATION AND PROFITABILITY:

Notes

$$Y = \frac{[\text{Ex-factory Fabric Price (P)} - \text{Cost of Production (C)}]}{P} \text{ (per cent)}$$

$$X = \frac{\text{Yarn cost}}{P} \text{ (per cent)}$$

The ratios should be considered as indicative since only the average of the prices of yarn used as well fabrics produced are computed.

1 The cost of production includes yarn value, weaving wage including AWF ex-gratia (wherever applicable), and the cost of design printing (wherever applicable). And excludes unpaid pre-weaving processing.

2 This is a shadow price and includes the high initial expenditure on yarn processing and setting the Jacquard loom with specific design.

3 Including the costs of pre-weaving processing.

4 Not in Jacquard loom.

5 Mulberry reeled silk plus 'matka'/'phool', either as warp or weft.

societies in local markets collude and effectively keep the price depressed. The huge margin between the official regulated price and the local market price is an attractive source of income to the charitable societies (who are not supposed to distribute the profits), and also to the co-operative societies (to whom it accrues in the form of 'unaccounted income'). Thus, there is little inducement on the part of the society to invest in spinning operation apart from that required for window-dressing. And the technology remains at the primitive stage – manual operation of ordinary country 'takli' (spinning wheel). The spinning of finer yarn of more than 50s generally requires skill of a high order in the takli, but that remains perennially under-paid. Naturally the local spinning is concentrated overwhelmingly in lower counts (coarser) yarn.

The production of mixed yarn fabrics is, however, largely restricted by the availability of raw materials, a large part of which is actually the by-product of mulberry silk yarn production. Thus the aggregate supply of spun yarn would constitute about one-tenth of that of reeled silk yarn. The societies thus have only a very narrow space of financial adjustment. After the supply of low-valued spun yarn gets exhausted, the societies have to fall back upon the two to three times costlier mulberry reeled silk yarn. It is found that the majority of the single loom owned weaver households have a monthly wage income around Rs 300-400 while the 'full-capacity' loomage would have fetched something more than double the amount. The expansion of the domestic unit by adding more looms to the existing 'stock' only marginally improves family incomes, when the society constitutes the only source of supply of yarn. The weavers, of course, are free to mobilise yarn from the market and undertake independent weaving. In fact, they are able to procure yarn from the reelers on-credit. But since the societies do not buy the silk materials from the independent weavers they have to depend on the PSMs who claim unusually substantial share in value added.

SUMMARY STATISTICS

The 'primitive' household organisations do not act atomistically. Rather, they are organised under oligopolistic inter-dependence. There is varying uncertainty regarding the long-run demand schedule – high for HG and low for relatively standardised LG. Advertising for sales promotion is practically non-existent. The average-cost pricing thus secures the working of the market. Different organisations of production, however, have widely different costs (Table 1), and pricing on the basis of average costs by each unit independently is

expected to result in market instability and price wars. But, even if the demand schedule is unpredictable what a producer certainly expects is that above a price the demand would be highly elastic while below that price it is less elastic (a 'kinked' demand curve). The stability is provided by the usual fact that a price increase by any particular unit or a group of units entering into collusive agreement would not be followed by others and thus she or the group would face demand shrinkage while a price-cut would be generally followed by others. Thus, the prices are fairly sticky despite changes in demand and costs. The price leadership, for the 'orderly co-ordination' and functioning of the industry, is given by the society who is, however, not the least cost producing organisation. The PSMs with average cost lower than the society thus yield a wide space of operation in the non-collusive oligopolistic market.

There is no effective trade union of the weavers, and individual weavers have very weak bargaining power. The supply of labour to the individual unit in the industry is perfectly elastic: the unit can employ (hire) any amount of labour it wants at the same wage. The wage-level ($W = S_L$) is usually that which is being fixed by the apex body of the societies, and the PSMs operate at a level below that. In other words, the PSMs' competitiveness is largely a contribution of the captive labour force. The other element of competitiveness of the PSMs is their access to yarn at a relatively cheaper price. Few of the societies have captive in-house yarn production and they are linked to the yarn 'market' via the 'unauthorised' commission agents. The PSMs thus have a greater degree of flexibility in input-mix as compared to that of the society. Yet, the PSMs are known for their 'cheaper/inferior' variety of a particular product being produced

by the society. And that provides the society with a distinct market share despite price disadvantage. To the extent the consumers possess 'information' on quality.

Table 1 shows the profitability across fabrics and organisations. To note, the HG materials which experiences a relatively 'volatile' market yields lower rate of profit than MG. The more generalised/standardised LG pure silk materials yields a nominal 10.8 per cent whereas the mixed fabrics production gives a much higher rate of return. Production organisation-wise, the profitability is highest for the PSMs (i.e. 43.85 per cent).

In aggregate, the profitability $\{(P-C)/P = Y$ (per cent)] is well explained by paid labour-hours per fabric (X_1) and the proportion of yarn cost to value (X_2) (Table 2A). However, for the society alone, while the coefficient of multiple determination shows a strong association between Y and X_1 ($b_1 = -0.3011$), X_2 ($b_2 = -0.8036$) the partial correlation is found to be significant only for X_2 . On the

other hand, for the PSM, both X_1 and X_2 are found to have significant negative correlation with the rate of profit. In other words, the better the fabric (since the fabric quality is largely determined by the labour-hours required for weaving), the lower is the profitability. It shows that the PSMs' high profitability rests on 'average' quality of the fabrics.

The widely varying 'mark up' gives a weak linear association between costs and prices in the industry. Further, no significant linear relationship between (paid) labour-hour and the profitability of a particular fabric is observed in a bivariate distribution (Table 2B). The average-cost rule of pricing predicts the behaviour of setting low mark-ups for products with close substitutes and high mark-ups for commodities with few substitutes. This may explain high mark-up by the society for HG materials with few substitutes. But, for MG, the PSMs and the societies although produce close substitutes the mark-ups are high, particularly by the former. Thus, it seems difficult to relate profit margin with the demand elasticities. Rather, using Joan Robinson's (1933) concept of monopolistic exploitation, it can be argued that the labour is paid a price which is less than the value of its marginal product. And this situation amply leads to less than full-employment level of operation in the industry. The substantial volume of unpaid labour actually consolidates the problem; and, the orthodox economics of 'reserve army' fails to gain ground.

III

Concluding Remarks

The value (at current prices) of the silk produced by the societies in West Bengal increased from Rs 224.4 million in 1990-91 to Rs 260.5 million in 1992-93 (KVIC, Eastern Zonal Certification Committee). Of these, 18 co-operatives together contributed 35-39 per cent. In fact, the share of the co-operatives in the aggregate of societies' outputs declined over the years. Most of the subsidies and 'soft' loans provided to the societies by the government through KVIC have gone to the charitable societies who, performance-wise, in so many ways, are indistinguishable from the local PSMs. They have alternative means of incomes which, unlike in the co-operatives, are not distributed. Yet, like the PSMs, the charitable societies are not found to be endowed with any discernible dynamic element.

The general understanding is that the cost of production is high when specialisation and division of labour are limited. However, in a labour surplus economy the unpaid proportion of labour, which is nothing but self-exploitation, congealed in the com-

modity produced is generally considerably high. This renders the household organisation of production cost effective from the point of view of the market. Our exercise on profitability, in fact, may also indicate the household organisation's space to absorb external shocks. However, its capacity is severely constrained by the distribution of initial endowments. The weavers hardly generate any surplus beside subsistence. Moreover, they by no means possess any marketable collateral asset which would have yielded the entitlement to seek institutional finance. Since their capacity (loom and labour) to produce remain grossly underutilised under the society they might attempt to replenish that with borrowings from private credit market. But, since the nominal monthly rate of interest, without collateral, being at least 8 per cent and the rate of return on utilisation of the fund (in weaving) normally does not exceed that rate (more because the independent weavers are practically having no direct access to the retail market) the borrowers are likely to be trapped.

The states, on the other hand, has not been quite active in penetrating the market apart from (a) giving legal recognition to the society organisations, and (b) occasional distribution of monetary benefits to the societies. Even within the narrow boundaries of action the lackadaisical attitude of the state to this industrial outwork has been quite pronounced. For instance, following the government notifications, the societies allow 'festival discounts' (rebates) on their products which are supposed to be readily reimbursed by the apex body. However, the latter, particularly the KVIB, West Bengal owes a huge sum of money to its affiliated societies on that account which has accumulated over last couple of years resulting in resources crunch of the societies. The public financial institutions, on the other hand, are very reluctant to extend credit to the societies while the apex organisation (KVIC), under the guidelines of the new economic policy, has stopped flowing credit directly to the societies. Consequently, the system of transaction on-credit in the weaving as well as upstream production lines has precipitated with more strength.

In 1968, the committee that was appointed to assess the progress of khadi and village industries recommended that emphasis in future expansion of khadi programme should be increasingly on organising production in such a way that the element of subsidies either direct or in the form of management grants and free weaving facilities is reduced to the minimum possible. This would involve adoption of better techniques of spinning and weaving, and reduction of overhead expenses of the organisation [GOI 1968: Chapter VIII]. Further, the committee noted

that the emphasis in future "should increasingly be on the positive" rather than the protective aspects of development assistance" (ibid. p 93). In this connection, it pointed out the need to check the disproportionate increase in the administrative staff of KVIC and KVIB in order to reduce the huge expenditure on administration of khadi programme.

The Eighth Plan states the necessity to reorient the khadi programme in order to create additional employment opportunities [GOI, Planning Commission 1992, Vol II, p 135]. However, the reorientation of the current programme in desirable directions seems to be quite a difficult task since only very limited 'information' on the detailed working of the khadi societies are available to the otherwise huge sized apex organisations. "The state of affairs in technical education in the textile colleges also calls for a review, although handlooms predominate weaving in West Bengal the curricula hardly reflects that. Further, when intervention in the credit market seems to be socially desirable, it by no means constitutes the agenda of the state. On the whole, the power of representation of the artisans being far too weak the sector has failed to evoke more active intervention by the state. And, the post-colonial urban-biased development strategy of the state has, in fact, consolidated the persistent duality in the domestic economy. The khadi programme, like many other 'pro-poor' programmes of the government, in fact, has been bent by the powerful agents of the rural elites to their advantage. On the other hand, the dominant market forces have adjusted with too many non-formal 'ties'. What seems to be needed is to cull lessons from, in particular, the Chinese experience of massive development of rural industries in the 1980s, the growth of the atomistic units have been directly supported by the trade corporations under active government supervision [Wall and Fukasaku 1994].

Notes

[This paper is one of the results of a project on 'Beneficiary Assessment under the National Sericulture Project (1989-94) in West Bengal' which was funded by the World Bank through the Central Silk Board, Government of India. I am thankful to Sunil Sarkar and Samiran Banerjee who assisted me in the field-enquiry. I am also thankful to Sushil Khanna for comments on an earlier version. I alone, however, remain responsible for any errors in the paper].

1 I primarily rely on my own field-survey data. For the debate on agricultural productivity in the state and the reliability of data in the *Economic Review* published by the government of West Bengal, see Datta Ray (1994 and 1994b).

- 2 A figure fabric in which the figure is developed by floating the warp thread, the weft or both and bound in a more or less irregular order. The ground is usually formed of a weave of simple character.
- 3 In 1805 Joseph Marie Jacquard, a silk loom designer, invented a way of controlling the warp and weft threads automatically. He recorded each pattern by punching holes in a strip of pasteboard cards.
- 4 The division of warp thread into two layers to form a shed for the interlacement of longitudinal and transverse threads in a fabric.
- 5 The Planning Commission (GOI) defines the poverty line as the monthly per capita total expenditure of Rs 49.09 for rural areas (at 1973-74 prices) at the national level (GOI Planning Commission 1993). Taking into account the state specific consumer price index (food and non food index combined) for agricultural labourers (GoWB *Economic Review*, Statistical Appendix, 1993), the poverty line in 1992-93 in rural West Bengal was not less than Rs 200 (current prices).
- 6 The use of (mulberry) reeled silk yarn and the spun silk yarn from pierced tasar cocoons (called katra yarn) from pierced mulberry cocoons (called matka yarn) from tasar cocoonpunches (called balka yarn) and from reeling silkwaste (called phoot yarn) in various combinations bring out wide varieties of fabrics.
- 7 In the case of mixed fabrics (e.g. silk matka, silk phoot or matka phoot) the rate of return is higher, and also since spun yarn is cheaper the initial capital requirements are lower than pure silk fabrics, hence the weavers do borrow from private lenders.
- 8 That is, the grants for training, research and technical advice and assistance, and loans for working capital.
- 9 Even on the numbers of operating societies, let alone others, the information available to the two agencies, namely, differ considerably.

In the Shadow of 'Kotris'

An Analysis of Wool Markets of Rajasthan

Sunil Ray

The marketing of raw wool in Rajasthan is embedded in multiple exchange relations. Conventions, contractual interlinkages and asymmetry of information are the rules which dictate the process of price formation of raw wool. This continues to happen in spite of government interventions which sought to make changes in the exchange structure by means of controlling the behaviour in the market place.

MARKETING is conventionally understood to be an autonomous price-making institution [Harriss 1991]. The voluntary movement of goods from the producers to the consumers via the market presumably ensures allocative efficiency of resources. However, what is generally observed is that all markets actually fall short of the efficiency and utility maximising standards in relation to which they are evaluated [Harriss 1991]. In a partially developed or an underdeveloped market, various implicit or informal contracts, through personalised interchanges, become a method of circumventing the problem of imperfect information during production and exchange [Jagannathan 1987]. It is in this context, that it is necessary to understand the constitution of the market, analyse various exchange relations that exist at all levels and then seek the relevance of theory.

The marketing of raw wool in Rajasthan is embedded in multiple exchange relations, in that the constitution of the market continues to be old and, hence, the forces that determine exchange relations are yet to undergo a meaningful change. Exchange relations are simple at the point at which raw wool is purchased from the sheep rearers. It, however, tends to become more complicated as the raw wool passes through the chain of intermediaries to the commission agents, and finally, to the raw wool processors.

The process of price formation is such that it could hardly fit in the orthodox single commodity-single sector evaluation. Conventions, contractual interlinkages and asymmetry of information are the rules that dictate the process of price formation of raw wool. This continues to happen in spite of government intervention, whereby changes are sought in the exchange structure, by means of controlling the behaviour in the market place. This article evaluates the process through which the wool market operates in the state, examines the forces that determine prices of raw wool and shows how the benefits of the trade are distributed between the wool producers, the middlemen and the commission agents.

I

Wool Market: The Real Market

Alca'ntra writes in his introduction to *Markets in Principle and Practice*, "...a great many rural people around the globe are only tenuously integrated into wider markets of any kind". Subsequently, in the same paper, he observes, "over large areas of the world, however, the survival of rural people depends on long standing and rigid relations of subordination, whether in the context of feudal society or within a structure of mercantile power which stands between a local peasantry and the wider economic and political system" [Alca'ntra 1993]. Wool markets in Rajasthan, where merchants occupy the commanding position in the sphere of exchange almost resemble what is observed by Alca'ntra. The raw wool producers, the sheep rearers who hail from remote areas, hardly come themselves to sell their produce in the market. Those, who come to sell directly, constitute a small minority while a majority of the sellers are what is locally known as 'bicholiya' (middleman). Middlemen are of two varieties - the one who operates within the age old interlocked system and the other who does not.

Exchange relations between the middlemen and wool merchants and the wool producers and the middlemen in many cases, are determined by the interlinkages between the wool and the credit markets. Credit is provided by the middleman or commission agent for two purposes, viz. (i) to earn interest and (ii) to ensure easy supply of raw wool at almost no risk and uncertainty. The interest rate may be as high as having the components of monopoly profit [Lipton 1977; Michie 1978] but it varies, depending upon the relations that exist in the sphere of exchange. In some cases, however, no interest is charged.

PRODUCERS, MIDDLEMEN AND COMMISSION AGENTS

One of the features of the interlinkages at the bottom (sheep rearers and middlemen), which is slightly different from the landlord-

tenant relationship [Bhaduri 1973] is that middlemen, in some cases [including those who hail from the Muslim community, provide credit without charging interest. They provide it only to ensure uninterrupted supply of wool from the sheep rearers who get bonded to the middleman. So much so the rearers cannot sell wool to anybody else without the permission of the middleman to whom they are bonded. Although they do not pay interest, they are left without any choice. The middleman takes advantage of it. The restriction imposed informally on the freedom of the wool producer to sell his produce at whatever rate he chooses, obviously entails a cost which may be equivalent to paying interest or more than that.

Of course, there are wool producers who do not operate within the framework of interlinkages, but they are vulnerable to it and the chances of getting bonded are high. The scale of their choice is limited by the spatial and dispersed locational characteristics of wool production, migration, weak, communication and transport. This is exacerbated by the uncertainty about the lifting of their wool stock, since they do not know who will be coming to buy and when, and the risk of prices falling.

The middlemen go even to the places where the rearers migrate. In many cases, the rearers receive clothes, grocery, etc., instead of money in exchange for the wool they 'sell' to the middleman. Even if the rearers could know about the ongoing rate in the market, and the rate happens to be higher, they may not be able to bargain for a higher price in such situations. Of course, those who have not borrowed can bargain better, but they cannot hold their produce for a long time in order to gain more profit. This happens not only because of price uncertainty, but also because they need money as early as possible. Raw wool is sold either on a per sheep basis or by weight.

All these factors together push the rearers to the fringe of the market and keep them there constantly, while the income which the market generates from the rearers' wool, is shared by the middlemen and the wool merchants. The rearers live on the fringes

of markets and seem to have been caught up in a very chaotic and contradictory process of incorporation into the developing political and economic system [Alca'ntra 1993].

The exchange relations between the middleman (variety I) and the commission agent is informal, but seems to be very strong and stable. Middlemen are tied down with advances of money, which are offered by the commission agent. They accept the advance, based on an informal understanding that the commission agent will not sell wool below a certain rate. Normally, such advances are given a little before the shearing season begins. Apart from fixing the minimum price, the total quantity of wool the middleman is supposed to bring in for sale is also fixed within a certain range. However, only 50 to 60 per cent of the expected sale value is given to him in advance. The rest of the sale value is given only when the full quantity of wool, as agreed upon, is brought to the agent. At the time of final payment, interest and other possible deductions (shown later) are taken care of by the agent. How does the agent gain in the process? Apart from earning interest, he earns through manipulation of the wool price (as discussed later). The middleman, who appears to lose in the process, shifts the burden of such loss to the sheep rearers, again through his stable and informal contract with the latter.

Almost the same sort of exchange relationship is found to exist between the independent middleman (middleman variety II) and the commission agent. However, the only difference is that he does not receive any advance before he brings wool to the market. He may be entitled to obtain loans from the commission agent against the wool which he brings to him for sale. He brings and stores wool in the agent's godown and is entitled to get a loan to the extent of 50 to 60 per cent of the expected sale value of the wool. Sometimes, the percentage of loan is hiked to 80 per cent to ensure that the person does not run away from him but continues to sell wool through him. Here also, the scope for manipulating the price of wool and cornering the benefits of the trade by the agent is wide. It happens specially when the middleman sells wool through secret trade 'under the cover' method practised by the wool merchants.

II

Basic Features of Markets

In order to provide for 'orderly' marketing of agricultural produce, market committees known as Krishi Upaj Mandi Samitis (KUMS) were constituted with the following primary objectives [Yadav 1993]: (1) Effective regulations of the sale and purchase of agricultural produce; and (2) Establishment of market-yards for marketing of agricultural

produce so as to save the farmers from the exploitation by middleman, and to enable the purchaser to get quality commodities at 'competitive prices'.

Since raw wool is treated as an agricultural commodity, the regulations stipulated are all equally applicable to it. However, wool markets, by and large, stay beyond the enforcement of such regulations and are found to retain the traditional mode of trading in the market place. There may be a few exceptions, but they are not significant. Informal transaction is the predominant feature of the traditional trading behaviour. The regulatory provisions seem to have been flouted in many respects in order to retain the mode of transaction at the informal level.

In this context it is imperative to understand some of the basic features of wool market in the market place and explore ways and means through which the merchants derive income from wool trade. The basic features of the four major wool markets of Rajasthan are shown in Table 1. Wool markets are located elsewhere too in the state. However, they are smaller in size as compared to the markets taken into consideration here. The features as shown in Table 1 are informal but established norms that dictate market practices in reality. In market places both sellers and buyers congregate but the competitive spirit of the market is subdued

by the mercantile power. How some of the practices are operationalised are explained below.

There is, by and large, no competition between the commission agents while buying raw wool. An informal, but stable arrangement seems to exist between the wool sellers, the buyers and the commission agents. Each commission agent appears to have sufficient number of middlemen (sub-agents) who are the main sources of raw wool supply. The Kekri market is an exception in this regard since open auction (spot pricing) takes place here.

It is, however, difficult to discern why the number of commission agents in all markets, except Bikaner, is relatively small. According to KUMS officials, as such there is no restriction on the distribution of trade licences. However, those who apply for licences come only from the same family circles. In this way, wool trading in the market has become the business of a few families. There may be people outside such family circles in taking interest in doing this business, but, their number is insignificant. What is also important to note in this context is that the traders' lobby is very strong so much so they defy market regulatory provisions of the state in many respects. It is true that market yards are constructed in all major wool markets in the state. But

TABLE 1. BASIC FEATURES OF WOOL MARKETS IN RAJASTHAN

	Jodhpur	Beawar	Kekri	Bikaner
Price fixation under the cover method	Yes	Yes	No	Yes
Commission charged on the seller's wool (per cent)	2.50	2	2	2.50
Commission charged to the wool buyers (per cent)	1.75	1.75	1.75	1.75
Interest paid by the wool seller to the commission agent on the advance taken (per cent per annum)	18	18 to 24	18	16.8
Interest paid by the wool buyers if payment for wool is not made within 15 days (per cent per annum)	18	18 to 24	18	16.8
Rent charged by the agent from the wool seller for storing wool	Rs 3 per quintal per month	Rs 5 per quintal per month	Rs 5 per quintal per month	Rs 3 per quintal per month
Weighing wool as a source of extraction	Yes	Yes	No	No
Standard deduction from the wool sold	2 kg per 40 kg	2 kg per 40 kg	1 kg per 40 kg for scoured wool - 1 kg to 5 kg for unscoured wool	1 kg per 40 kg for scoured wool 3 kg per 40 kg for unscoured wool
Weighing charge	Rs 2.50 per quintal	Rs 5 per quintal	Rs 4 per quintal	Rs 3 per quintal
Market tax paid by the commission agent (per cent)	1.6	1.6	1.6	1.6

trading of wool hardly takes place in the market yards in all markets. It, however, continues to take place in what is locally called 'kotri' in Bikaner and Jodhpur.¹

Market yards were constructed by the KUMS of Bikaner for wool traders almost 10 years ago (in early 1980) and provisions were made for 96 traders to trade in wool. However, only two years ago (earlier to 1993 when the survey was conducted) a notification was served by the government on the traders to occupy the yards. One does not see any reason why issuing of the notification was postponed for such a long time. Of course, shops and godowns were allotted to those who regularly paid market tax. While issuing the notification, traders were warned that, in case they did not move from kotris to the allotted yards and began their business, their trade licences would be seized. However, the number of yards allotted was less than the number of traders who had applied for them. Those, who were not allotted yards, filed a suit in the high court and brought a stay to the allotment.

Although a few traders moved to the market yard and began their trading activities during October 1992, they failed to continue as it went against the interests of the kotri. The traders seem to be reluctant to move to the market yards because they fear that they may not be able to continue with the traditional kotri trade practices on the one hand, and flout the regulatory provisions, which might involve certain risks on the other. Both these together might eventually reduce their trade margins. Kotri trading practice even in Jodhpur is so stringent that it appears to be virtually impossible to force the traders to trade in the market yards. However, one does not know whether trading would be fair, if the traders shifted from kotris to the market yards. For instance, it is only the market yards of Beawar, where trading takes place under the gaze of the KUMS administration, and yet, almost every unfair trade practice takes place there and it is in no way different from kotris.

One of the unfair means of wool trade extensively used by the commission agents, and which goes against the market regulations, is the secret trade practice of 'under the cover' method. This is practised without any inhibition in all markets except Kekri. The code of this practice is known only to the commission agents and the wool buyers, while the wool sellers are kept in the dark.

The process is as follows. Let us suppose that a buyer is prepared to buy wool at Rs 40 per kg. He indicates it to the commission agent with his fingers under a cover, so that the seller is not able to know what price the buyer is offering. The code of the fingers is known only to the agent and the wool buyer. Hence, the rate of Rs 40 per kg is

known only to the agent. The agent, in turn, communicates the seller the rate; but, it is not Rs 40 per kg. He communicates a rate which is less by Rs 5 to Rs 6, or more depending upon the quantity and quality of the wool the seller has brought to sell. The agent tells the seller that his wool can be sold at, say Rs 35 per kg. Once the seller accepts the deal and the wool is sold out at this rate, the balance in price is shared between the commission agent and the buyer at a proportion depending upon the strength of their relations.

If there are more buyers, it is again the commission agent who holds the key. Only he knows the competitive margin between the buyers, and accordingly manipulates the deal in his favour. In Jodhpur market, this practice is prevalent in an acute form. The only exception is the Kekri market, where wool is sold by auction. An auctioneer, who is an employee of KUMS, supervises the auction and records the final rate at which the wool is sold, the name of the agent to whom it is sold and the total quantity.

As shown in Table 1, the system of weighing wool is another source of extraction from the wool seller especially in the Jodhpur and Beawar markets. The man who does the weighing is paid by the wool seller but he appears to have an informal contract with the agents not to weigh wool properly and illegally procure more wool from the sellers. For instance, if one quintal of wool is weighed in ten instalments, the chances of losing wool will be more than if it were weighed in two or three. However, it is again in the Kekri and Bikaner markets that relatively better care is taken to weigh the wool accurately.

Impurities, dirt, etc. are found to be the pretext, based on which, a certain quantity of raw wool is earmarked for deduction in each market, as can be seen from Table 1. From the total quantity of wool brought by the seller the rate at which deductions are to be made is standardised in each market. It is in the sense that each seller has to give an extra quantity of wool to the commission agent, for which payment is not made, no matter even if the wool is scoured. Of course, for scoured wool, the extra quantity given is less as compared to unscoured wool. For instance, if the seller brings 40 kg of unscoured wool, he will be paid for only 36 or 37 kg of wool. One can understand if the seller is being paid a low price for inferior quality wool. But, here, the seller is paid not only a low price for his wool but also gives an extra quantity for which he is not paid at all. In this way, the commission agents are able to acquire a considerable quantity of wool which they get cleaned and sell at a higher price. Besides, commission agents purchase wool at a low price, get it cleaned and sell it at a higher price.

III

Distribution of Gains of Trade

As has been mentioned elsewhere, only a limited number of sheep rearers come on their own to the market to sell their produce. Hence, the largest number of wool seller are middlemen. In any case, wool sellers of all types bear the transaction cost almost to the same extent, except, in those cases where the seller sells through 'under the cover' system. In order to gauge how gains of trade are distributed, two cases are presented below, one of an independent rearer who remains outside the interlocked system and sells wool independently in the market where secret trade practice 'under the cover' is absent. However, the second case shows the return of a middleman seller who operates in the interlocked system.

Case I. A seller who is a rearer himself, came from village Kaktu of Ajmer district to sell his produce in the Kekri market. His village is 60 km from the market. The size of his flock is 200. He came to sell 90 kg scoured wool. If he had sold his produce in his own village, he would have had to sell at the rate of Rs 15 per sheep. It means that he would have earned $200 \times \text{Rs } 15 = \text{Rs } 3,000$. The rate per kg of wool can then be estimated to be Rs 33. Instead of selling in the village, he sells at Kekri market at the rate of Rs 47 per kg, a difference of Rs 14 per kg. Now, let us see how much of that Rs 14 per kg finally accrues to him. The gross value of his produce is $\text{Rs } 47 \times 90 \text{ kg} = \text{Rs } 4,230$. However, he bears transaction costs to the tune of Rs 680.75 as shown in Table 2.

Hence, he could earn Rs 3,549.25 (i.e., $\text{Rs } 4,230 - \text{Rs } 680.75$) from the sale of his produce in the market directly. The extra amount he could earn, as compared to selling in his village, is Rs 549. The difference between the returns selling in the village and in the market is $\text{Rs } 4,230 - \text{Rs } 3,000 = \text{Rs } 1,230$ which is shared between the rearer and the transaction cost he pays for taking

TABLE 2. MARKETING COST OF THE INDEPENDENT SHEEP REARER

Item	Expenditure (Rs)
Cost of shearing* @ Rs 1.50 per sheep	300.00
Octroi charge paid	3.00
Transport cost up to the selling point	148.00
Own expenses towards food, etc.	35.00
Commission paid @ 2 per cent	85.00
Standard deduction @ 1 kg per 40 kg	105.75
So, in this case, it is 2 kg and 250 grams	
Weighing charge	4.00
Total	680.75

* Cost of shearing being borne by the rearer is included here to compare with the village situation where the middleman offers Rs 15 per sheep that includes the cost of shearing

Excerpts from the speech by Shri K. L. Chugh, Chairman, I.T.C. Limited, at the 84th Annual General Meeting held on 28th September, 1995.

This is the last time I address you as the Chairman. At ITC we dreamt to position each one of your Businesses in a leadership position — growing and becoming internationally competitive. We dared to dream of growing ITC into one of India's Multinationals.

It is in the last year of the millennium, growth opportunities are stacked on the table of my decision to retire with effect from December 1995 — twenty months ahead of my planned retirement. This decision of mine was motivated by only one factor — the feeling that all of us in ITC should not become a victim to forces of individuals and forces of institutions.

With the Special Audit Committee of the Board and the Board of Directors rejecting the fallacious allegations contained in the Special Audit Report, both against the Company senior Directors and managers and me personally, I felt it would be in the interest of ITC that I announce my decision immediately thereafter.

ITC'S BEST KEPT SECRET

Today I will share ITC's best kept secret. In fact, it is an unsung achievement to which, today, I will attempt to pay its just tribute — the quality of ITC's human resource and human resource management.

Today, all thinking and action in ITC is more business-process oriented than functional in nature. In serving the consumer, the Company organises itself more holistically than before. In addition to nurturing and making our brands come alive, in addition to creating excitement in the market, we also re-oriented our posturing on many other business processes. Greater emphasis on management of technology and profits through manufacturing were our key sources of satisfaction. Bringing the overall standards of manufacturing towards international levels was part of this effort.

DISCOVERING LEADERSHIP CHALLENGES

So complex is the nature of issues at times to come, that the choice before ITC's people and its leadership will not be in a few dimensions.

In my opinion, and through my experience, the leadership of tomorrow

will have to focus on wisdom more than intelligence.

The leadership of tomorrow will have to focus on courage. There will be many testing times and many intelligent rationalisations. With no courage, it is difficult to make even only knowledge. It is difficult to win respect and commitment.

The leadership of tomorrow will have to be in absolute harmony with society.

OUR RESULTS

In the past four years, building further on the solid foundations I inherited from my worthy predecessors, both your Company and Group have grown enormously. In ITC the Gross Income has grown two times (Rs. 2316 crores to Rs. 4709 crores), Net Income 2.5 times (Rs. 1014 crores to Rs. 2540 crores), PBT by 3.3 times (Rs. 121 crores to Rs. 402 crores), PAT by 3.4 times (Rs. 78 crores to Rs. 262 crores), Net Assets employed by 2.9 times (Rs. 562 crores to Rs. 1640 crores), Net Worth by 3.3 times (Rs. 258 crores to Rs. 855 crores) & Dividend distribution by 3.7 times (Rs. 36 crores to Rs. 131 crores).

In terms of the ITC Group, our position is even stronger. Over the past four years the Gross Income has grown 2.6 times (Rs. 2689 crores to Rs. 7084 crores), Net Income 3.5 times (Rs. 1369 crores to Rs. 4859 crores), Net Worth 1.9 times (Rs. 345 crores to Rs. 1700 crores), Dividend 4 times (Rs. 43 crores to Rs. 188 crores).

CIGARETTES & TOBACCO

Four years back we had a declining cigarette market. Today, we have a growing market. The market has grown from 79 billion to 94 billion this year and is continuing to grow at the rate of 10% per annum. And yet this represents a less than 1% growth in the share of all tobacco products.

Four years back we had a 55% volume share. This has grown to 63%. Our value

share also stands improved from 60% four years back to nearly 70% this year.

Not only are we selling more cigarettes (from 37 billion cigarettes a month four years ago to 5 billion cigarettes a month now), the quality of our products is now internationally competitive.

Product design, product development, applied research and market research help us

deliver new product launches to satisfy consumer needs. Ten new brands have been successfully launched.

ITC's volume of small length cigarettes has grown from less than 5 million a month to over 400 million a month in March '95.

The kingsize cigarette has also grown by 180%.

Exports are increasing. The newly launched brands in the USA and Russia are doing well. Contract Manufacture continues to improve and shows signs of becoming a very major activity.

Keeping in view the future demand, we have planned a major investment programme to invest over Rs. 550 crores to modernise our factories and establish a new, large, sophisticated factory in Bangalore, just outside the city limits.

The plants at Chirala and Anaparti have become the first leaf processing units in the world to earn the ISO 9002 certification.

All this would not have been possible without our carrying conviction with the Policy makers that excise is a cost and a more reasonable approach would be beneficial for revenue, consumer, tobacco growers and the industry. I am grateful to the government that it appreciated our logic. The results are obvious. Market has started expanding, consumer price increases are lower than inflation and I am confident that the Company's contri-

"The leadership of tomorrow will have to focus on wisdom more than intelligence."

"ITC's best kept secret is the quality of its human resource and human resource management."

bution in terms of excise duty payments will be up by at least 17% up to September, 1995, well above the 7% increase in excise duties this year.

Four years back I had said that Tobacco is a sunrise industry in India. The sun has just begun to rise. After all, cigarettes are less than 20% of tobacco consumed in India.

FINANCIAL SERVICES

Financial services is one of ITC's key thrust areas with immense opportunity for growth. ITC's Group Company, ITC Classic Finance Limited, is not just an acknowledged leader in funds mobilisation and asset financing but to meet emerging needs of the investor has diversified into investment and merchant banking, real estate finance, home finance, stock broking and advisory services to NRIs on investment.

HOTELS & TOURISM

With the restructuring of the Hotels business during the year, ITC Hotels -- a 71% subsidiary -- has been made responsible for the growth of this business. ITC Hotels can now invite wider public participation to mobilise resources and can grow much more rapidly than hitherto. Grand Kakatya, Hyderabad has just had its soft opening. This will consolidate our position in the Golden Triangle of the South -- Bangalore, Madras, Hyderabad.

Our Group Company, International Travel House, from being a sick company just four years back, is today healthy, vibrant with a market capitalisation of Rs. 100 crores and is actively participating in the growth of tourism and development of golf courses.

AGRI-BUSINESSES

Agri-Businesses were redefined and restructured. The Edible Oil Business is being consolidated under the group associate ITC Agro Tech, with all activities including marketing, which was hitherto undertaken by ITC, coming under its fold. The oilseed business has been restructured and consolidated under ITC Zeneca, a 50:50 Joint Venture with Zeneca plc UK.

PAPER BUSINESS

Tribeni Tissues, the Paper division of your Company has just completed its programme of expansion and modernisation. The installed capacity of the mill has now been increased to 33,000 tonnes per annum from its earlier level of 13,500 tonnes per annum. The investments have been made just in time when the cigarette market is doing well.

ITC's paper business flagship -- ITC Bhadrachalam Paperboards Limited -- has well consolidated its position in the Paper Industry in India and has emerged as one of the largest units in the country, its profits having trebled during the last four years.

INTERNATIONAL BUSINESS

The Company had embarked upon international business in 1991, the year in which the country's balance of trade position touched the lowest ever figure of US \$ 8.1 billion. A major thrust on exports through setting up the International Business Division

was your Company's response as a responsible corporate citizen to the national need of augmenting foreign exchange reserves, at a very quick pace.

The foreign exchange earnings of your Company in the last five years were of the order of Rs. 3000 crores. ITC continues to remain one of the largest foreign exchange earners of the country.

With successive years have also had our share of problems. Perhaps, we went into far too many products too soon. There were a few wrong trade deals including export of rice to Sri Lanka at prices considerably higher than inter-

national prices. All these while, adding to the turnover of foreign exchange earnings of your Company, also led to high export receivables. After this came to our knowledge throughout the whole of 1994-95, the focus was to control the damage and recover the export receivables, as well as to rationalise, restructure and refocus the business. Despite efforts, a significant quantum of receivables are uncertain of recovery leading to provisions in 1994-95 accounts. These provisions should be viewed as few human errors in the process of generating Rs. 3000 crores of exports for the country.

I believe our emphasis on exports has added value to ITC as an enterprise deeply concerned with national priorities which in turn has added substantially to the growth and standing of the Company. With our learning and actions, international trade can become a viable business for ITC, adding value to the foreign exchange reserves of the country.

ITC Limited

Tobacco • Cigarettes • Financial Services • Hotels

Paper & Paperboard • Packaging & Printing • Agri & International Businesses

This does not purport to be a report of the proceedings of the 84th Annual General Meeting

AUDIT AND FINANCIAL IRREGULARITIES

The issue of financial irregularities and Special Audit in the International Business Division has attracted much attention in the recent past. The Special Audit Report had alleged corrupt trade and FERA violation, as also preferential pricing on some exports.

On the basis of hard data and expert legal counsel, the Special Committee of the Board consisting only of the Non-Executive Directors has rejected these allegations. It has also concluded that I, as the Chairman of the Company, was in no way responsible, even constructively, for the controversial deal of the International Business Division.

ONE LAST WORD: GRATITUDE

With its size, its resources, its people, its businesses, its understanding of the context and its consistent commitment to achieving results, ITC is destined to play its due role in the India of tomorrow. This is in your competent hands. For my part, I would like to state that the one word that springs to my mind at the end of my innings is gratitude. I am indebted to the lakhs of individual shareholders. I must mention with great respect the role and support of the institutional shareholders. In the face of many compulsions, they chose to be on the side of conviction and supported our beliefs.

Since the pioneering days in Bhadrachalam when I first came in contact with BAT, I have enjoyed a great relationship with BAT as shareholders and friends. I am thankful for the support I have received during the years.

I would like to extend warm thanks to all the people in the government, industry, associations and other fora with whom I have interacted. I must thank my colleagues on the Executive Board without whose support ITC would not have been what it is today -- at the leading edge of corporate India.

Last, I would like to convey my utmost gratitude and admiration to the people within ITC. I can surely say that the ITC family is the best family in the world to be in.

I now look forward to the proud day when ITC meets its trust with destiny to successfully emerge as one of India's Multinationals.

But when one dares to dream and discover, there is no looking back. The voyage must continue.

his wool to the market. As shown in Table 2, he incurs transaction cost to the tune of Rs 680.75. Hence, Rs 549.25 out of the Rs 1,230 is left with him as his share or Rs 6 out of Rs 14 per kg of wool. In other words, he spends 55 per cent of his income that he earns in the market in order to earn 45 per cent of the income generated. If middleman had been there, the amount would have been shared by him also. In that case, agent's share would have gone down.

The agent, however, finally earns on this wool to the tune of Rs 194.75 (items 5+6+7 of Table 2) + Rs 74.02 (1.75 per cent commission charged to the buyer) + Rs 190.35 [interest charged to the buyer for three months² = Rs 459.12. If we add the income of the commission agent, then the said quantity of wool finally generates gross income to the tune of Rs 4,494.37 (4,230 + Rs 74.02 + Rs 190.35). Hence, the difference in income between the village and market is Rs 1,494 (Rs 4,494.37 - Rs 3,000) which is distributed between the agent, the rearer and transport cost and others.

It is estimated that the agent earns to the tune of Rs 459 (31 per cent), rearers Rs 549 (37 per cent) and transport cost and others Rs 486 (32 per cent). This is estimated at the price, commission agent purchases wool from the rearer. However, he sells the same obviously at a higher price to the processors. In that case, the same quantity of wool would generate more income than what is shown here. Rearer's share of the income finally generated would then be further lower. If the rearer had sold through the credit system, he would have paid interest and the percentage of the agent's earning would have been more. Since, 'under the cover' practice is absent in the Kekri market, and weighing is done accurately there and the agent's income is relatively less there as compared to other markets. However, in markets like Beawar and Jodhpur, the agent earns much more from the independent seller than what is shown in respect of the Kekri market.

Case 2: The case of a middleman. He hails from Disha of Gujarat state. He came to Jodhpur market to sell wool which he had purchased from the migratory flock owners of Marwari sheep. He paid Rs 12.50 to buy wool on per sheep basis and purchased 4 quintals of scoured wool from 1,050 sheep. The total investment he made was Rs 13,125 (Rs 12.50 x 1,050 sheep = Rs 13,125). In other words, the rate at which he bought the wool can be estimated to be at Rs 32.81 per kg, say Rs 33 per kg. However, he sold at Rs 45 per kg in the Jodhpur market. Hence, the gross value of his wool is 4,500 x 4 = Rs 18,000. Now, let us examine how much he has earned from the trade. Shearing cost is borne by the rearers. The items on which cost is borne by him are shown in Table 3.

The gross return received by the middleman is Rs 18,000 - Rs 13,125 = Rs 4,875. Net return = Rs 4,875 - Rs 2,053 = Rs 2,822. Let us suppose that the middleman does not store the wool in the agent's godown and does not borrow money and intends selling the wool within one or two days. Even in such a case, he has to pay a certain amount to the commission agent, since the wool will be sold through 'under the cover' system and a dishonest weighing system. The reason why most of the sellers prefer to sell through the credit system is because it apparently involves less risk and uncertainty for them than selling the wool through 'under the cover' system. Besides, the way the system of marketing has evolved tends to bring the seller more and more under the contractual system which eventually widens the scope for the commission agents to make more profits. For instance, as and when wool is brought to the market, a buyer may not be readily available. The seller faces uncertainty and, finally, he accepts the compulsion of taking an advance against the wool which he deposits in the agent's custody to be sold later.

The commission agent earns through item number (5), (6), (7) and (9) of Table 3 and by way of charging commission, as per the government stipulation from the buyer and earning interest from him. Hence, the gross return of the commission agent can be estimated as follows:

	(Rupees)
Earnings through items (5)+(6)+(7)+(9) of Table 3	1,524
Interest charged to the buyer [@ 1.5 per cent per month for three months (assuming that the wool is finally sold at Rs 18,000)]	810
Commission charged to the buyer (@ 1.75 per cent)	315
Total	2,649

Thus, the commission agent makes first round of income equal to Rs 1,524 from the seller and the second round from the buyer to the tune of Rs 1,125. It appears that the seller adds more to his return than the buyer. If we include the commission agent's income from the commission he charges to the wool buyer (Rs 315) and the interest charged from the wool buyer (Rs 810) then, the income finally generated by four quintals of wool would be equivalent to Rs 19,125 (Rs 18,000 which is paid to the middleman + Rs 315 + Rs 810).³

Hence, the difference is Rs 6,000 (Rs 19,125 - Rs 13,125 paid to the sheep rearer) which is distributed between the middleman, the commission agent and transport and other costs. This is shown in Table 4. The point to be noted is that the middleman has to bear the transaction cost (including transport, etc) altogether to the

tune of Rs 2,053 as shown in Table 3 to earn Rs 2,822. It appears that the middleman earns 47.03 per cent of the value generated by the wool sold as shown in Table 4, by incurring the transaction cost to the tune of 34.22 per cent. His margin is higher than what is his transaction cost because he paid low price to the rearer for scoured wool. One has to bear in mind that the return of the middleman and the commission agent is estimated on the basis of the price at which wool is purchased from the middleman by the agent. The agent, however, sells the same at a higher price to the processor. In that case margin left to the middleman of the income finally generated will be lower while it will be higher for the commission agent. It is difficult to know at what rate wool is finally sold, although a bill is prepared quoting the rate at which payment is made to the wool seller.

The actual price at which it is finally sold to the buyer may be higher (which is normally the case) than the price paid to the seller. In that case, the rate of return per quintal of wool would be more than what is shown above. Those few sheep rearers who sell on cash payment basis do not borrow and pay interest. But, they are subject to 'extraction' in two ways: viz, through weight manipulation and 'under the cover' system. It is difficult to compare the relative rate of return that accrue to the commission agents from the credit system and the system of direct selling. Since wool trade takes place mostly through the credit system, it can be said that there is wide scope of the commission agent for earning a higher rate of return. This is why it continues to perpetuate as the dominant trading behaviour in the market place. The scope for increasing the return of the agent is certainly better, but he does not appear to make use of that scope by manoeuvring the system in a way that could inflict damage on his informal contract.

TABLE 3. MARKETING COST OF THE MIDDLEMAN

Item	Expenditure (Rs)
1 Transport cost	325
2 Octroi (per quintal Rs 6.50 x 4)	26
3 Unloading charge (Rs 7 per quintal)	28
4 Weighing charge (Rs 2.50 per quintal)	10
5 Commission (@ 2.50 per cent)	450
6 Interest (Rs 1.50 per cent per month for one month on 60 per cent of the value of Rs 10,800)	162
Standard deduction at 2 kg per 40 kg (200 kg)	900
8 Transport cost (from main road to Kotri) (@ Rs 10 per quintal)	40
9 Godown charge (@ Rs 3 per quintal per month)	12
10 Expenses incurred on food and other things for two days	100
Total	2053

with the middleman. He cannot afford to take the risk of losing him.

SHEEP REARER'S NET RETURN

The net return only from the sale of wool can be estimated based on the cost incurred towards the production of wool alone. This is, however, impossible to estimate because the rearer spends money towards the maintenance cost of sheep, not for wool production or mutton purpose alone but for both at a time. The sheep rearers earn from sheep by selling (i) wool fibre, (ii) animal (sheep), and (iii) night folding, while cost incurred towards maintenance of sheep and imputed cost of family labour are the same for all. Since net return of the respective source cannot be estimated, rearer's position may be examined in terms of net aggregate return.

Of all eight sheep breeds of Rajasthan, Magra and Pugal sheep generate maximum balance per flock size, say, of 130 to 150 sheep to the tune of Rs 9,000 to Rs 10,000 per year. This is the balance received by the rearer when only maintenance cost of the flock is taken into consideration. The maintenance cost includes paid out cost on account of feed, medication, transport, etc. To include the imputed cost of family labour, the amount family labour required to maintain the flock is considered. Total manhours required is estimated to be equivalent to the employment of three persons round the year. Even if the minimum wage, as stipulated by the government for agricultural labourer, is considered while estimating the imputed wage cost of three family labour for the year and are added to the maintenance cost, the position of sheep rearers in terms of net return would appear to be precarious.

It is in this context wool market assumes great importance since income earned by the sheep rearers through the sale of wool fibre is low. As such, productivity of sheep in terms of wool has gone down considerably in recent years. In such a situation, if the wool market continues to expropriate the value added that deserves to be shared by the sheep rearers and compensatory income from the sale of sheep does not rise, sheep husbandry is likely to turn out to be 'distress adaptation'. It would eventually fail to provide forward linkages to the processing sector.

IV Lessons

The wool market of Rajasthan provides a few insightful lessons, which appear to have much in common with the markets of many agricultural products of the third world countries, including India [Harris 1984, 1991; Alca'ntra 1993; Janakiraman 1993].

All these studies have analysed market relations, identified the factors that determine such relations and showed how the real producers are being constantly deprived of the actual value of their produce. Wool markets of Rajasthan are not exception to this.

To eliminate imperfections and ensure fair trade, the Rajasthan Agricultural Produce Market Rules were framed in 1964. In order to implement these rules, as has been mentioned earlier, Krishi Upaj Mandi Samiti was formed. Subsequently, Rajasthan State Agricultural Marketing Board was established in 1974 under section-22A of the Rajasthan Agricultural Produce Market Act, 1961, in order to bring more efficiency into the regulatory work, as well as to implement the provisions of the Act effectively [Yadav 1993]. Further, the Directorate of Agricultural Marketing came into being in 1980, on the recommendation of the National Commission on Agriculture (1976), to ensure proper functioning of the regulatory mechanisms, grading, quality, control, etc. Over three decades or so, there has been considerable change in the organisational aspects, for the state to intervene to ensure market regulations for fair trade to take place. But, in the 'real market' situation no such change has been induced. It has, however, been induced in the Keri market in certain respects. The government, otherwise, is mainly concerned with the collection of market tax. Market regulations are flouted to perpetuate the merchants' own internal regulations, in that the same sources of extraction continue, resulting in higher transaction cost to the wool seller while wool merchants are able to gain substantially. Merchants, and not the state, being in a commanding position in the sphere of exchange, appear to have been able to make the state serve their mercantile interests.

The state also has the history of direct participation in wool trade in order to free the wool producers from the middleman-commission agent nexus and the unfair trade practices. Way back in 1964, the state used to purchase wool directly from the wool producers through the sheep and wool department. Subsequently, it was felt that Breeders' Co-operative Societies, through which trading could be operationalised at

the village level, should be formed. With this end in view, the Rajasthan State Co-operative Sheep and Wool Marketing Federation came into being and began to function in 1978. As many as 545 co-operative societies were constituted in the rural areas [Singhvi 1993]. Sheep breeders were reported to have benefited considerably in this endeavour of the state. However, after a few years of operations, they were discontinued due to reasons best known to the government. Consequently almost all the breeders' societies became defunct [Ray 1992]. Attempt was made again, after a lapse of nearly a decade to revive the organisation in order to participate directly in the wool trade and pass on the benefit of the trade to the breeders. Nobody knows where such an attempt would lead when market relation is determined by power or coercion and control.

Coercion and control are forces that mainly determine the market relations in the wool market. They operate at both levels of wool marketing, viz. the wool merchants and middlemen and middlemen and wool producers, in that the former in both cases, exercise control and coercion over the latter. Of course, those wool producers who keep themselves away from such forces and trade independently might gain more but their number and the extent to which they gain are too small to account for. The forces of coercion and control stem from the power, which the commission agent exercises over the sellers, including middlemen, by means of manipulating prices and information through secret trade practices, forming a lobby of their own associational power [White 1993] and contractual designing. These forces limit the scale of choice of wool seller either in the market or in the countryside and exercise their power subtly through the market practices which have been standardised. Here, it is 'power theoretic framework' [White 1993] that appears to be more relevant than 'choice-theoretic framework' in analysing the process of marketing and exchange. The wool merchants' lobby is so strong that, even in auctions initiated by the government agency, bidders join together and form a cartel leading to pre-decided price bidding [Singhvi 1993].

TABLE 4. DISTRIBUTION OF GAINS OF TRADE BETWEEN COMMISSION AGENT, MIDDLEMAN AND OTHERS

		Return (Rs)	Per Cent
Middleman	(Value at which wool is sold in the market)		
Commission agent	(value paid to the sheep rearers) + (transaction cost) Items (of Table 3) (5) + (6) + (7) + (9) + commission and interest charged to the buyer	2822 2649	47.03 44.15
Transport and other costs	Items (of Table 3) (1) + (2) + (3) + (4) + (8)	529	8.81
Total		6000	99.99

Trading of wool is absolutely private but operates within the framework of interlinkages and, as explained above, leaving little or no room for choice especially of information, an important instrument of power in economic transactions [Baland and Platteau 1993], of which secret trade practice is the main part. All these speak of the market that exists in reality but differs in its essence from the conventional free market models in which supply and demand forces are impersonal and are supposed to allocate the resources in an optimally efficient manner.

The increasing demand for local wool of superior quality hardly raises its relative price due to 'oligopolistic-monopsonistic' market forces. Hence, what the World Bank suggests [World Bank 1981, 1986] that relative prices, through the process of automatic adjustment, would expand the opportunities of the rural people, especially in largely agrarian societies and finally revive the economies and, therefore, government regulations are to be removed, do not seem to have relevance to the actual operations of the market. The case of the wool market clearly shows this.

V

Conclusions

In the wake of deregularisation of private trade under the liberalisation and structural adjustment programme, the wool market in Rajasthan continues to remain imperfect, although it has virtually been deregularised. Since it limits the livelihood provisioning and opportunities of lakhs of wool producers living in the rural area, consumption linkages which have the potential to revive the economy get restricted. This leads us to suggest 'reform' of the wool market in an effective manner without leaving any scope for it to fall in line again with the mercantile interests. The market needs to be extricated from the shadow of kotris. In the face of gradual intensifications of the conflicts in the production conditions of raw wool, if deprivation of the actual wool producers though depressed value of their produce continues, it will push rural households towards giving up sheep husbandry. The state should not ignore the market relations in which the poor are embedded and the non-poor thrive and should 'reform' the relations, as a part of the anti-poverty strategy.

Notes

[The paper is an outcome of a part of a large study sponsored by NABARD. It was presented at IDS Sussex (UK) when the author was there as a Visiting Fellow during 1993. The author is grateful to V S Vyas for his guidance and support. He is thankful to Hans Singer, Barbara Harriss, Martin Greeley and Simon

Maxwell for their valuable comments. Thanks are also due to Jagdish Prasad Sharma and Gopal Singh Rathore for their assistance.]

- 1 It is spacious house, a portion (preferably ground floor) of which is used for conducting wool trade while the trader and his family live in the other portions of the house. In Bikaner and Jodhpur markets, wool is traded in these houses which are, by and large, designed in traditional pattern. Here, the term kotri is used to symbolise traditional practice of wool trade, trader's lobby and market leakages - all that largely serve mercantile interest through the forces of coercion and control of the merchants.
- 2 Wool merchants may earn interest by investing the same amount of money somewhere else. The interest rate may vary, however. The main concern here is to comprehend what the wool merchant earns, including interest, while he invests in the wool trade. The time taken by the wool buyer to make full payment to the merchant may vary and hence, the amount of interest income.

The Race between Ford and Toyota

Struggle for World Dominance

Peter Custers

This paper provides a description and analysis of Japanisation/Toyotism and draws comparisons with the Fordist system of mass production which emerged in the US in the early part of this century. The Japanese regime, and its application by multinationals worldwide, has already heralded a new phase in the process of capital accumulation.

The serial production of mass commodities is not abolished in a Japanised structure; on the contrary. The Japanese automobile and electronic companies – like just their American competitors – aim at standardised manufacture of mass products on the largest possible scale. But in order to reach this goal, the internal, hierarchical relations within enterprises, and external relations, are being profoundly restructured. For the trade union movement of industrial workers, including in third world countries like Mexico, Brazil and India as well, Japanisation has far-reaching consequences.

IS Fordism “a new mechanism of accumulation and distribution of finance capital, based directly on industrial production”? Does Americanism then constitute a distinct phase, a new epoch, in the history of capitalist production? These questions the Italian revolutionary thinker Antonio Gramsci posed himself, when, suffering from prolonged detention under fascism, he wrote his world famous *Prison Notebooks*. At the time when Gramsci wrote down his views, the new American production methods – the workers enchained to the assembly line, and the stopwatch as means to closely regulate his movements – were rapidly gaining prominence. Outside the prison walls, these methods formed the object of fierce debate between intellectuals belonging to various streams. Ultrarightist Italian intellectuals, for instance, discussed how Fordism could be adapted to Italian conditions, they propagated a marriage between American style, organised mass production and the corporatist state.

Gramsci's views, formulated in the desolation of his prison cell, eloquently testify to his extraordinary sharpness of mind. They do not merely prove that he was a keen observer of social trends in his own days. In fact, some of his views retain the value even today, 60 years later, Gramsci for instance dwelled on the dilemma which the introduction of the conveyor belt posed for entrepreneurs. The capitalist, so he argued, can mechanise the physical movements of the labourer, but this does not prevent the latter from using his brains. “One walks automatically, and at the same time thinks about whatever one chooses.” American industrialists according to Gramsci were conscious of this ‘dialectic’ underlying the mechanised mode of production. Notwithstanding the spread of Fordism, assembly line workers in the US and western Europe have continued putting

up resistance against the despotism of the factory system. Yet, more recently, Japanese companies appear to have discovered a more effective answer to the question of how to obtain absolute control over the factory workers’ thinking processes, namely, through instituting ‘quality circles’.

Roughly 80 years have passed since the American company owner Ford introduced the conveyor belt system and concomitant management techniques (derived from Taylor) in his automobile factories. These methods enabled Ford and other American enterprises to temporarily gain hegemony within the world economy. Today, a new production model is rising to prominence – a model which stipulates ‘quality circles’ and ‘subcontracting’ as key concepts. The model is closely identified with one Japanese corporation, Toyota – like Ford a giant company belonging to the automobile sector. Throughout the industrialised north, as well as in third world countries like India, multinationals and minor capitalist gods are frantically studying the Japanese model. They are bound to re-adapt the organisational structure of their companies in the worldwide rush for superprofits.¹

Analogous to Gramsci's initial conceptualisation of the previous phase of world capitalism, Japanisation is understood as a new phase in the history of capitalism. The present phase is not just distinct from the period when the views of Ford and Taylor held sway, it invites a re-examination of the fundamental critique of the capitalist system. For, today's developments should encourage us to critically re-assess the relevance of the views put forward by capitalism's most powerful critic, Karl Marx. In order to grasp the international trend towards Japanisation, we need to adopt a non-orthodox, Marxist approach.

I

Japanese Capital: Commercial to Industrial Subcontracting

To start, let us briefly highlight an important aspect in the history of Japanese industrialisation – the more or less direct transition from commercial subcontracting to vertically organised, industrial subcontracting, as was imposed by fascism. In the middle of the 19th century Japanese society, as is well known, was still largely characterised by feudal relations. True, there existed a rising commercial bourgeoisie. This class was composed of intermediaries, called ‘tonyas’, who increasingly operated as entrepreneurs, since they had started regulating craftsmen's production work. The tonyas distributed raw materials, and sometimes equipment, to self-employed craftsmen and homeworkers, and they brought the final products to the market. Under these conditions of infant capitalism, the Meiji restoration was launched from the year 1868. The process of the modernisation of society was facilitated, because it was favoured by members of the traditional elite, Samurai warriors. Delegations were sent to Europe and the US ‘to learn from foreign countries’ Machinery and expertise were imported so as to prepare the founding of the first silk-spinneries and textile factories. Thus, from the later part of the 19th century onwards, the factory system of production rapidly superseded craft production dominated by the tonyas.²

Yet, it would be wrong to believe that the Meiji restoration ended the role of home-based industries and of traditional intermediaries. They were only partly superseded by the factory system. Many small producers adapted to the new conditions, by installing electric motors in their own workshops – mechanisation reached the drawing room of the craftsmen

and by taking to the manufacturing of modern goods like bulbs, rubber products, western umbrellas, etc. In the footsteps of the Samurai, the tonyas too transformed themselves. Instead of continuing to function as the link between craftsmen and the market, they now became supply line businessmen. They henceforth chose to fulfil the task of subcontracting for industrial enterprises to act as intermediary between homeworkers and the factory. It is only when the fascist regime enforced rationalisation of production, during the 1930s that their role came under serious threat. Those tonyas who failed to provide technological guidance to the small producers were eliminated under the joint pressure of the fascist government and monopoly companies.

During this period, from 1935 to 1945, the system of subcontracting was developed which more recently has helped Japan build up a strong reputation amongst entrepreneurs worldwide. Partly in consequence of the brutal wars fought, the country suffered from a severe lack of raw materials. The government introduced a system of rationing industrial raw materials and imposed price regulation upon intermediaries. Most far-reaching was the government's attempt to unify the subcontractors of major companies via horizontal co-operation. When the desired result was not obtained, corporate enterprises themselves streamlined the structure of subcontracting: they selected the most efficient clients and brought them under corporate control. Small supplier firms were rationalised through instructors and by providing them with instruments to improve product quality. Moreover, a mutual division of labour was promoted between the subcontractors. Thus arose the typically Japanese pyramid-shaped structure of production.

The period after the second world war merely brought a further refining in methods of control over subcontractors, when the transfer of knowledge regarding financial accounting and that regarding management techniques were added to the regulatory mechanisms. The proportion of production which is sub-contracted has greatly expanded during recent decades. This is true in particular for the automobile sector, where the share of production that is sub-contracted amounts to 70 per cent at least. In short and contrary to Marx's expectation, the factory system of production has not completely replaced the network of small producers, but has rather subordinated them, has adapted this network to the needs of corporate capital.

Before discussing the effects of this elaborate system of subcontracting on labour, I wish first to comment on the second central aspect of Japanese style company management: the labour groups or quality circles. Once more a historical review is helpful for Japanese companies have employed the idea of labour groups for the purpose of enhancing productivity for long decades. Examples can be traced to reports regarding working conditions in textile factories, the spinneries and weaving mills, where women a century ago worked to lay the foundations of Japan's industrialisation. Thus groups of female labourers employed in textile companies and organised along district lines in the beginning of the 20th century engaged in sports competition initiated by management. The same groups were encouraged to undertake production competition by offering them little prizes in reward. Ascently, when entrepreneurs tried to devise clever means to influence the thought processes of the overwhelmingly female workforce.

Today the system of labour groups, now baptised quality circles, has become a common phenomenon in almost all Japanese factories. They are to be found in the large enterprises of key industrial sectors, such as automobiles and electronics, but also in the smaller sub-contracted firms. During my visit to Japan in 1990, a woman employed in a company producing temperature regulators for Toyota trucks described how the women workers during off time are forced to jointly ponder over possibilities for raising productivity. For individual women there simply is no escape: the company manager does not just own the wage slaves' labour time, but a part of their free time as well. And when visiting the multinational chips producer Fujitsu Electronics, managers in blue uniforms self-confidently stated to us that the factory's labour groups provide a guarantee for production without an undue number of errors. Thanks to the quality circles the workers are perfectly disciplined. In other words, the ideal of the trained gorilla, which American corporations earlier tried to reach through the use of the stopwatch, has to a frightening extent been realised in contemporary Japan.

In western countries the discussion about labour groups is not completely new either, as is evident e.g. from the postscript to Benjamin Coriat's book on the history and significance of Fordism, *The Workshop and the Stopwatch*. In many enterprises such groups were introduced in the late 1970s or

early 1980s in name of 'the humanisation of labour'. The significance of the system according to the mentioned postscript is as follows: Place him, or the migrant worker or the female labourer in a team or collective which itself decides on speed and working rhythm. Time and motion-experts with their stopwatches in their pockets are no longer required, nor are foremen who watch you, the worker, from behind. You yourself can decide how you want to work and how fastly. In other words, the formation of labour groups eliminates the need for detailed supervision. Contrary to the Fordist/Taylorist approach, the individual is no longer the basis of the labour process; it is the group that is considered its foundation. Moreover, since the income of the team, i.e. of all its individual members, is dependent on the productivity of each separate member, there is little chance that the group will show benevolence towards a lazy worker. The structure of the quality circles ensures strict self-discipline on the part of the exploited workers.

The new method which Japanese companies are teaching to their competitors, however, consists of more than the above sketched trend towards (what can schematically be termed) internal decentralisation. At issue is a phenomenon on the borderline between internal and external decentralisation: extensive competences are transferred to smaller production units within the factory complex. Such units tend to be granted a close to independent status. Responsibilities are delegated, flexibility is promoted while profits continue to flow towards the corporation itself. The extent of influence the model has developed internationally can be illustrated by citing the example of the Dutch steel foundry Hoogovens. The territorial size of this foundry's complex, its production structure, until recently, was an integrated one - is equal to a whole town. According to the masterplan formulated by 'Hoogovens' management, the factory complex is to be restructured along the model of the Japanese company Nippon Steel: the granting of far-reaching autonomy for the various sections/departments and the devolution of tasks, even with regard to marketing and the sale of steel products.

The key question remains of course whether such decentralisation really leads to 'the humanisation' of labour relations. According to a trade union researcher whom I interviewed in 1990 about the consequences of the trend described - the splitting-up of production into smaller units aspired to by

many Dutch companies outside the steel sector leads to the sidetracking of trade unions. Relations between management and trade unions become increasingly nebulous. It becomes more and more nuclear at which level negotiations about labour conditions should take place, which trade union a specific group of workers should join, etcetera. In short – the major danger being posed is decreasing solidarity, 'desolidarisation', between the workers and the further weakening of their collective power.

Above I have already given an outline of the historical evolution of Japanese subcontracting: the elimination of traditional middlemen and the vertical integration of subcontractors under the modern, industrial corporation. The corporation's relation with small supplier firms presently is primarily regulated via the principle of 'kanban', i.e., delivery of components or product parts just-in-time. This principle, can be wholly understood within the framework of classical, Marxist economic theory. What I wish to elaborate on first are the immediate social and economic consequences of subcontracting organised on Japanese lines. We should realise above all that a large degree of dependence is consequenced by the system. In the typical Japanese company, the so-called 'keiretsu', only the first line of subcontractors is directly owned by the mother company. Smaller supplier firms, on the contrary, are formally independent. Yet since in practice they generally are up to 100 per cent dependent on the orders of one particular corporation, they are virtually subject to the latter's arbitrary rule.

Subcontracting of product components in essence means that the Japanese automobile corporations and electronic companies are exempted from the fluctuations of the domestic and international market. Because small subcontractors are independent, the corporations are in a position to transfer market risks: in times of crisis not they, but the smaller fry are made to suffer. Thus, many Japanese industrial enterprises during the oil crisis of the 1970s demanded delivery on credit from supplier firms, by simply delaying the payment of components obtained. And when the yen suddenly rose in value in relation to other currencies, raising the price of crucial Japanese export products like automobiles and electronic gadgets – a price reduction was imposed upon the dependent and rather powerless firms supplying components. In the Tokyo area a reported 45 per cent of all firms were made to face these consequence of the 'yen-spiral'."

Yet the ultimate victims, having to face the brunt, are the male and female labourers

employed in the subcontracted firms. They are forced to make many hours of overtime, and in times of crisis are the first to be threatened with lay-offs. The secondary status faced by the majority of the Japanese labour force is well-illustrated by the working conditions applying to part-time labourers in Japan. From interviews taken of women workers in Japan it clearly emerges that many subcontracting companies, employing 100 persons or less, make extensive use of 'part-time labourers': women performing wage labour up to 7 1/2 hours per day (!), who earn wages calculated on an hourly basis, and who are paid less than half the amount earned by male employees in fixed service, then rate is 500 to 600 yen per hour at most. Many middle aged women in particular belong to this vast labour reserve. Since they can be dismissed at any time, they are termed 'throw-away-articles' in the Japanese press – analogous to the throw-away-sticks used by Japanese consumers to take their meals."

Both the Japanese government, the major corporations and the right-wing trade unions actively work to maintain these deplorable labouring conditions in subcontracted firms. They jointly ensure that the method of transferring risks to the workers remains firmly entrenched. The corporations themselves transmit knowledge about the labour groups, i.e., the quality circles, and they put pressure on the 'independent' suppliers to ban any trade union activities. The government contributes its share by issuing laws in favour of part-time work, and by promoting the growth of a system of 'manpower agencies'. Similarly, the powerful trade union federation Rengo has implicitly accepted the prohibition on trade union work in small supplier firms. Such is proven by functionaries representing Rengo. A regional secretary whom I spoke to in Japan defended the fact that Rengo only protects the interests of the relatively privileged layer of fixed employees by citing as argument that the undertaking of organisational work in subcontracted firms would lead to the loss of orders for such firms. In other words: the decentralisation of production and the silencing of most severely exploited groups in society are part and parcel of the very same Japanese 'model'."

FROM AMERICANISM TO JAPANISATION

During the 1960s and 1970s, progressive authors ardently studied and analysed the Taylorist/Fordist system, the management methods which as explained above were

introduced in the early part of this century in order to promote the mass production of commodities. The French author Benjamin Coriat for instance has given a lively description of the features and advantages (to capital) of the Fordist/Taylorist system. One of the key advantages he ascribes to the assembly line and the stopwatch is the "breakdown of the independent knowledge of the trained craftsmen over the production process." In the very period of capitalism's ascendancy, entrepreneurs realised that the independent knowledge of the workers over their own production provided them with considerable power. This power limited, Coriat argues, the control entrepreneurs could exercise in the historical, first phase of capitalist production. It made them dependent on the physical presence, in the locality of their operation, of people knowing the ins and outs of the given trade.

This dependence on the craftsmen's knowledge forms the background to the struggle waged in England during the 19th century over the (proposed) lifting of the ban on emigrations. Many skilled cotton workers in the Lancashire region wished to leave in the second half of the century, since they were famished due to (temporary) unemployment. Their impending exodus was fiercely resisted by manufacturers, and triggered a debate in the British Lower House – a debate which was won by proponents of maintenance of the emigration ban. The manufacturers outspokenly stated their interests, "Could one imagine a more disastrous plan for all classes of the country than to weaken the Nation by exporting its best labourers?" "The owners of British textile factories could not dispense with a skilled workforce. The presence of many unskilled workers in the US, on the other hand, facilitated the introduction of the methods propagated by Taylor and Ford – the chronometer and the assembly line. During the period 1885-1915 alone, 15 million people migrated to the US – most of them semi- or unskilled workers. Thus, American entrepreneurs could rather easily launch an offensive against skilled workers who temporarily tried to defend their jobs by relying on the principle of the exclusive workshops ('closed shops'), and on labels which in name guaranteed the quality of the commodities ('blue labels')."

The Taylorist phase of mass production caused fragmentation of production tasks and an accompanying breakdown of skills – changes which enhanced the power of entrepreneurs over the whole production process. According to Coriat, the time and motion studies of experts used to discipline

the workforce were explicitly aimed at facilitating the massive integration of unskilled immigrants into the industrial production process. They were aimed at making craft-workers superfluous. The system, however, was not bereft of disadvantages. Its main drawback was that the remaining knowledge possessed by the workers, their creativity, could not be optimally used. 'Japanisation' in my view signifies that a solution has been found to this drawback of Fordism. Male and female workers organised in labour groups, both in the large corporations and in subcontracted companies, are obliged to wreck their head over production problems. They are forced to constantly think about how to increase production efficiency. It is often said in Japan that workers, employed by Toyota, think 24 hours a day about production. Japanisation thus signifies the effective appropriation of the remaining knowledge and insights of the workers. 'Their knowledge is permanently tapped'

Since both Taylorism/Fordism and Japanisation are crucially concerned with the effective use of and control over human knowledge, it is useful to further elaborate on this theme. Harry Braverman, the American author of a classical study regarding the work processes under monopoly capitalism, has analysed the evolution of technical knowledge and its application by capitalist corporations up to the 1970s of this century. Just like the Frenchman Coriat, he stresses that at the dawn of capitalism the skilled worker was the repository of human techniques required in the labour process of his/her particular branch. The craftsman/woman – the potter, the tanner, the smith, etc. – combined in mind and body "the concepts and physical dexterities of the speciality", and his/her technique was "the predecessor and progenitor of science"¹⁰

Now, the history of the conquest of technical knowledge, its appropriation by the capitalist from the skilled worker, has long been blurred by modern science. Yet the aim of this conquest, and the methods to achieve it, were quite explicitly stated by Frederick Taylor. Taylor's crusade was aimed at convincing the American entrepreneurs of his day that they should develop a complete 'monopoly' over knowledge, so as to "control each step of the labour process and its mode of execution". He advised that, first, the managers should "assume the burden of gathering together all of the traditional knowledge which in the past had been possessed by the workmen", and, second, that "all possible brain work should be

removed from the shop and centred in the planning and pay-out department."¹¹ Indeed, Gramsci's interpretation, referred to in the introduction was very precise: the purpose of Americanism was to break up the old psycho-physical nexus of qualified, professional work.¹²

The separation between conception and execution, proclaimed by Taylor as a cardinal principle of capitalist control, has historically given rise to the creation of a new profession, the profession of the technical engineer. In the US, as Braverman records, there existed as few as 30 engineers or quasi-engineers in the year 1816. The first census which mentioned the profession as a distinct one showed a number of about 2,000 engineers, "few of whom had gained their titles through academic training, and most of whom were engaged in canal and railroad construction". It is only in the last two decades of the 19th century that the number of engineers rapidly expanded, only in the 20th century did they become a mass occupation: there were some 1.2 million technical engineers bearing responsibility for conceptualisation and planning of production in the year 1970.¹³

Seen against this background it is more than ironic that in the last quarter of the 20th century, monopoly capitalist corporations have abandoned Taylor's insistence on the strict separation between conception and execution, his open advocacy of dehumanised labour. Whereas on the one hand the engineering profession is being undermined partly by the development of computer technology and the growth of an army of data-workers, engaged, like engineers, in the task of conception and planning – on the other hand Japanese companies have commonly instituted 'quality control circles' of shopworkers engaged in studying work processes and potential improvements in work methods. Yet before concluding, as monopoly capital would like us to, that what is at stake is the 'humanisation of labour', let us have a closer look at the functioning of Japanese quality circles.

The spread of the quality control circles – a system that has greatly contributed to the superiority of Japanese automobile concerns and other multinationals over their European and American competitors – is a rather recent development. It is true, as argued above, that 'labour groups' engaged in production competition, have existed in Japan since the founding period of industrialisation. In the late 19th and early 20th century textile companies organised speed-up campaigns, i.e. they sought to intensify exploitation through competition between groups of women workers. Yet the

idea of quality control, in the form of zero defect drives, has reportedly originated in the US missile industry. It was brought to Japan in the late 1950s by the Japan Productivity Centre. According to Muto Ichio who has specialised in Japanese industrial relations since the second world war, the idea was 'wedded' to the pre-existing 'small group concept'.¹⁴

As Ichio and other sources confirm, the quality control circles mushroomed during the 1960s and 1970s. In 1962, there existed just 23 such circles. By 1980 the number had increased to well over 100 thousand.¹⁵ The Japan Productivity Centre held a survey in 1976 which brought out that 71 per cent of the country's companies had instituted quality control circles. In big enterprises, employing 10,000 workers or more, the figure reportedly was as high as 91.3 per cent. One sector where quality control circles gained early ascendance was the sector of steel: the Kawasaki plant of Nippon Kokan Steel implemented quality control drives already in 1963. By the 1980s, the same plant, then reportedly employing 8,000 persons, counted 1,320 quality control circles, indicating that the company's whole workforce had been mobilised to participate.¹⁶

Through the quality circles Japanese companies have in a sense broken with the tradition of Taylorism which had hoped to reduce workers to virtual animal extensions of the machine. To a very limited extent, and in a distorted manner, Japanese companies have restored the nexus between the workers' physical and mental activity: once again, as in pre-Taylorist days, workers are permitted to hold some knowledge over their immediate labour process. Still, it would be very wrong to conclude that capitalism is bent on restoring the workers' original craft knowledge, for the workers' domain of knowledge is carefully delineated by the enterprise. It remains confined to his dehumanising, fragmentary production activity. And whereas the quality circles are forced to provide management with scores of suggestions on how to cut production costs, on how to reduce production errors to the barest minimum – the power to decide, to use the workers' bits of knowledge, remains entirely management's.

Lastly, let us note the following contradiction between the ideology and the practice of Japanisation. Proponents of Japanese management styles argue that the quality control circles represent a form of "participation by the workers in management", a form of 'self-management' ('Jishu Kanri'). The stark reality is that the quality circles help to further undermine

whatever workers' autonomy formerly had existed in Japan. The groups are instructed to convene and discuss problems of production-efficiency after the official working times. In general, the labourers are not paid any overtime for participating in the groups. In other words, the quality circles represent an unpaid extension of the labour day, a form of intensification of exploitation. Most alarming is, as Muto Ichiyo notes, that the quality control circles have usurped the role of workers' activism. "There is no room left for union activity to intervene, since all available time and energy of workers are absorbed by the company."¹⁶

One purpose of the Fordist/Taylorist system was to ensure workers' loyalty to large corporations by paying them relatively high wages, by introducing pensions, a social security system, etc. Ford, owner of the American automobile company, was an outspoken proponent of making economic concessions – to a select group of workers – in order to suppress the tendency towards resistance in key sectors of the capitalist system. The striving to build a labour aristocracy has been consciously pursued since the beginning of the century. Coriat concretely depicts how Ford conceived of his 'high wages' – idea. In 1915 he announced a big increment in the nominal level of wages; the pay rise involved no less than a doubling of wage-rates, up to 5 dollars per day (hence the slogan of the 'Five Dollar Day'). The immediate background to this step was a huge turnover in workers at Ford and other companies in the automobile city of Detroit. In 1913 alone 53,000 persons were recruited to fill a number of 15,000 jobs. Moreover, the city was beset with a mood of rebelliousness which Ford decided to counter by increasing the level of wages.

This last mentioned motive of Ford's was well understood by Gramsci in the loneliness of his prison cell. In *Prison Notebook* he amongst others discusses the Fordist 'ideology of high wages'. He argues that the American companies could only pay their high wages because they held a position of monopoly, which was not to last for ever, high wages besides were not being paid to all American workers, but only to those belonging to the 'labour aristocracy'; and the high wages were paid with the sole motive of keeping the workers in line. Though the entrepreneurs according to Gramsci purposely strived to transform the workers into 'trained gorillas', i.e. 'without workers' consciousness, they nevertheless continued functioning as thinking human beings, which the entrepreneurs understood.

"And not only does the worker think, but the fact that he gets no immediate satisfaction from his work and realises that they are trying to reduce him to a trained gorilla can lead him into a train of thought that is far from conformist."¹⁷

In a 'Japanised' production structure the need for a labour aristocracy remains. Thus, there exists as said in Japan a sharp divide between the male workers in lifelong employment, and the mass of 'throw-away' female labourers. However, in a structure with extensive subcontracting relations the individual responsibility of industrialists to maintain a reasonable standard of living is greatly reduced. The payment of a 'high wage' after all only applies to a very select group of fixed workers who undertake final assembly tasks in the main factory hall. All remaining categories of workers, in particular female workers, are paid low wages, and like the automobile workers in Detroit at the beginning of this century, they can be laid off at any time. Ford added numerous conditions to his spectacular wage offer. Toyota and other mammoth corporations in Japan have ensured that the financial concessions they need to make to the working class, remain confined within narrow limits.¹⁸

One of the advantages of Ford's system of the assembly line which is frequently overlooked, is that in such a system the turnover time of capital is accelerated. Surely, an entrepreneur's chances of reaping superprofits are enhanced by the speed with which his money is re-invested. Marx had underlined the importance of the theme of the 'turnover time of capital' by devoting a whole series of chapters to this theme in *Capital*.¹⁹ In connection with capital's turnover time he first makes a distinction between production and working time: the first one is generally longer than the second (see Appendix). If wood for instance first needs to be laid to dry before being used, or in case the production time comprises a period of fermentation of grapes, it means that a part of capital is temporarily stored and that the turnover time of capital is extended. A similar phenomenon I observed in Japan when visiting a tobacco company, in 1990. We passed huge cauldrons in which tobacco leaves, as we were told, remained stored for one year before being considered suitable for the production of cigarettes. A part of the company's capital thus was 'stored' in the form of tobacco leaves.

Like the production process, the circulation time of capital – the time required for the purchasing of raw materials and for sale of the commodities produced – can pose complications for the entrepreneur. The more

time there he required to find buyers for the goods, the more expenses are incurred in consequence of the storage of these goods after the completion of production. Marx calls the period of sale the decisive part of the circulation time. On the other hand – the entrepreneur may require extra financial resources since certain raw materials are auctioned only few times per year. What is involved here is the lengthening of the purchasing time, the starting period of capital. Entrepreneurs in industrialised countries wage a perennial struggle to reduce the turnover time of their capital, to accelerate capital's circulation: hence the anti-social phrase 'time is money'. Not coincidentally, Fordism and Toyotism are both systems in which workers are under constant pressure, in which there is a continuous effort to speed up production.

However, in the two systems the acceleration in the turnover time realised differently. Let's once again refer to the French author Coriat. "Ford introduced the production without stocks", he wished to "counter the loading of production materials", through a well-regulated supply and conveyance of all necessary materials. Ford himself is reported to have used the image of the river and its branches: the assembly line in his view served to promote a 'well-coordinated flow' of goods in the process of being produced. He was concerned primarily with reducing 'losses' in terms of money, capital, as a consequence of storage in-between various phase of production. By adopting his system of the conveyor belt many costs in connection with transport-labour were eliminated, as well as expenses made for storage of products, i.e. the maintenance of stocks of goods in between the various phases of production in the factory.²⁰

The same aim of reducing storage costs is also pursued in the Japanese structure of decentralised production. Here, however, the reduction/savings are not realised by pressing down the costs of storage during the production process itself, but by cutting down on expenses for holding stocks before and after the whole production time in the factory. The target of Toyotism is precisely the circulation time of capital. A concept which is wholly identified with the Japanese style of management is 'kanban', deliverance just-in-time. Since it is demanded from supplier firms that they deliver precisely on the minute, the second, stipulated by the company providing the order, the corporation is no longer burdened with the necessity of maintaining stocks of product components. And 'kanban' is a concept belonging entirely

to the era of the computer and the telefax, which means of communication serve capital in the very same manner by accelerating its turnover time. In short, kanban is a contemporary Japanese concept that can easily be understood on the basis of Marx's classical *Capital*!

CONCLUSION

The era of Japanisation forces leftwing activists to seriously re-analyse the capitalist system. It even compels us to re-appraise our fundamental understanding of the social system. In *Capital* Marx presumed that industrial entrepreneurs would unwillingly dig their own grave by bringing together thousands of workers under one roof in one factory complex. Marx argued as well known that capitalism created the collective worker who more or less spontaneously would strive to overthrow the capitalist system and build a socialist society. Marx did not hesitate to equate the very gathering together of workers in one and the same building or space with the new mode of production. A greater number of labourers working together at the same time in one place (or, if you will, in the same field of labour) in order to produce the same sort of commodity under the mastership of one capitalist constitutes both historically and logically the starting point of capitalist production.¹

Yet in the modern Japanese model which has heralded a new phase in late capitalism, the number of workers corresponding to Marx's ideal the collective worker is brought back to a minority of the working class to a minority also of the industrial labourers. Moreover, the shrewd Japanese capitalists have upset Marx's very conceptualisation of stages in capitalist production. Marx, it may be recalled, conceptualised three stages. The historical phase of home industries with its small independent producers working under the putting out system was followed by the phase of manufacturing in which specialised craftworkers under the leadership of one boss would labour in the same workshop. This system of manufacturing according to Marx would be replaced by the industrial system where workers would be reduced to mere extension of the machinery. True, Marx realised that home industries and manufacturing would not be immediately abolished by the capitalist system, would temporarily survive. Thus the production of clothing in England was characterised by a medley of transitional forms. Yet history would favour the factory—the variety of transitional forms, however, does not conceal

the tendency to conversion into the factory system proper.

Today's reality, i.e. conditions more than hundred years later, do not support the schematic view propounded by Marx. Home industries and mini enterprises have not disappeared in the economically most powerful over industrialised country of the world Japan. In fact, the continued existence of small subcontractors is purposefully aimed at by this country's large corporations. And although the mode of production in subcontracted firms admittedly cannot be equated with the one that prevailed in sweatshops in the earliest phase of industrial development, any profound understanding of Japanisation cannot be acquired without analysing the comprehensive network of subcontractors which is profitably maintained by Japanese and other multinational companies. It indeed is a crucial task for political economists today.

Should one then conclude that Marx is outdated, that his understanding of capitalism was wrong? Surely, the tendency to reject Marxist economics is great at a time when arrogant, elitist western press reports proclaim the death of Marxism. Anybody who continues to be infected with such ideas is simply branded an anachronist. I nevertheless hold that the outright rejection of Marxism merely leads to intellectual disarmament; it leads to subjection to a system producing trained gorillas and throw-away labourers—instead of producing liberated human beings. As illustrated through the above cited example of Marx's analysis of the turnover time of capital, his conceptualisation provides essential attributes for grasping recent developments in world capitalism. In fact, we can apply to the system of subcontracting the same analytical approach as I have done in my book regarding women's labour in order to fill blind spots in Marxism: the inheritance of Marxism should be expanded.²

Above I have tried to provide a description and analysis of Japanisation/Toyotism and have drawn comparisons with the Fordist system of mass production which emerged in the US in the early part of this century. I have argued that the Japanese style of management possesses two decisive characteristics: the quality circles of male and female labourers intended to mentally subject them to the corporation's rule and the structure of subcontracting which entails the transfer of production risks to the manufacturers of product components and the workforce employed by them. Those two elements are just as characteristic for Toyotism as were the conveyor belt and the

stopwatch for Fordism/Taylorism.

A comparison with Fordism further teaches that some 'bottlenecks' which entrepreneurs have been trying to solve ever since the industrial revolution under the system of Toyotism are solved in an original manner. Ford and Taylor hoped to once and for all do away with the rebelliousness, the spirit of resistance of the working class, through introduction of the chronometer and the assembly line. They were out to regulate factory production in a way that would help uproot from the factory the struggle against capital, the struggle for a human world. They succeeded only partly—witness for instance the wave of socialist inspired class struggle which engulfed western European countries like France and Italy during the 1960s and 1970s. Hence the force of attraction of Japan's style of management, the physical expulsion of the bulk of the male/female labourers from the factory halls and the splitting up of the collective workers in numerous small geographically separated units.

The Japanese regime—and its application by multinationals worldwide—has already heralded a new phase in the process of capital accumulation. For the future of the struggle for a viable world it is of crucial importance that this be fully recognised. The serial production of mass commodities is not abolished in a Japanised structure; on the contrary. The Japanese automobile and electronic companies—like just their American competitors—aim at standardised manufacture of mass products on the largest possible scale.³ But in order to reach this goal, the internal hierarchical relations within enterprises and external relations are being profoundly restructured. The terrible strength of Fordism, Benjamin Coriat wrote, 'lies in its enormous speed'. In companies that are ruled by the norms of 'kanban', speed and inhuman pressure are raised to unprecedented levels.

For the trade union movement of industrial workers—and here I not only have in mind the over industrialised countries, but third world countries like Mexico, Brazil and India as well—Japanisation has far reaching consequences. "Trade unions could be completely outmanoeuvred." An exclusive orientation towards the labour aristocracy or the collective worker, as trade unions, including progressive ones, have traditionally done, is not only incorrect from an ethical point of view. In such a strategy, the interests of only the most privileged section of male employees in fixed service are defended, while those of seasonal labourers, of temporary workers—and in particular of world's largest industrial reserve army

women remain structurally neglected. This strategy is moreover self-defeating, or through external decentralisation entrepreneurs succeed in undermining the power of the whole working class. In short, the capitalist strategy of 'kanban', of quality circles and subcontracting poses the need to fundamentally reconsider trade union strategies.

Appendix

MARX'S *GRUNDRISS* AND ANALYSIS OF TURNOVER TIME OF CAPITAL

In this Appendix, I wish to underline the extraordinary actual relevance of Marx's analysis regarding the problem of the turnover time of capital. When preparing for his theoretical and practical analysis regarding the capitalist system which he was to present in his *magnum opus*, *Das Kapital*, Marx during the winter of 1857-58 wrote a series of notebooks for self-clarification. These notebooks were to be published only a century later. They are now known as the *Grundrisse*. They have justly been termed a 'sourcebook of inestimable value for the study of Marx's method of inquiry' (See the Foreword by Martin Nicolaus to Marx's *Grundrisse*, op cit, p 7).

Two of the notebooks comprising the *Grundrisse* (Notebook V and Notebook VI) contain extensive passages on the theme of the turnover time of capital. First let me explain the meaning of the terminology. For Marx, the turnover time of capital refers to the whole cycle which capital completes; it refers to the composite of production time and circulation time, i.e. to the various phases capital passes through before, during and after the end of the production of a commodity (see pp 520/521 and p 618/619). Preceding the initiation of production (e.g. raw materials have to be procured, and after the commodity has been realised it has to be brought to the market). The time to cover these steps belongs to the circulation time of capital.

Now, the key question which Marx asks himself is the following: 'What influence does circulation time exert on the creation of value?' 'The question which interests us here is this: Does a moment of value determination enter in *independent of labour*, not arising directly from it, but originating in circulation itself?' (p 519³). Marx's answer is squarely positive: 'circulation time does exert an independent influence, and in order to illustrate the point Marx draws a comparison: If a value four times smaller realises itself as capital four times in the same period in which a four times greater

value realises itself as capital only once, then the smaller capital's gain - production of surplus value - is at least as great as the larger's (p 519). It can even be greater. Marx says, 'because the surplus value can itself again be employed as surplus capital'.

Thus, the calculation of circulation time proper, and of the total turnover time of capital, requires specific analysis. In order to understand an entrepreneur's capacity to accumulate, it does not suffice to know the rate of exploitation of his workforce, the surplus time extracted from his male and female labourers. We also need to take a look at the turnover time of his capital. The sum total of values produced or the total realisation of capital in a given epoch, is determined, not simply by the surplus time realised in the production process, but rather by this surplus time (surplus value) multiplied by the number which expresses how often the production process of capital can be repeated within a given period of time (p 544).

Marx further discusses whether circulation time is a positive or negative value creating element. Given that a moment enters into value determination - circulation time, which does not come out of the direct relation of labour to capital (p 538) - what influence precisely does circulation time exert? Marx considers circulation time a natural barrier: it is a time of devaluation. The more the circulation of capital can be speeded up, the larger the speed with which the production process can be repeated, the better this is for the owner of capital. In other words, 'circulation time in itself is not a productive force of capital. All that can happen through the acceleration and abbreviation of circulation time - of the circulation process - is the reduction of the barrier posed by the nature of capital' (p 545).

The above helps explain several major contemporary trends of international capital, i.e. the specific mode of operation of Japanese companies ('kanban') and capitalism's drive to further develop the means of communication. The time needed to maintain stocks of commodities produced, for instance, is influenced by the time required to transmit orders. Whereas originally these needed to be conveyed by couriers or letters, with a transmission time of several days, the invention of the telegraphic system, and more recently the fax system, have brought the transmission time down to nearly zero. Thus, the development of telecommunications serves capital's need to reduce circulation time to the barest minimum. To once more quote Marx himself: 'Capital by its nature drives

beyond spatial barriers. Thus the creation of the physical conditions of exchange - of the means of communication and transport - the annihilation of space by time - becomes an extraordinary necessity for it' (524).

Marx's analysis surely helps us understand the enormous popularity - among entrepreneurs - of the Japanese principle of 'kanban'. Capital is interested in limiting to a minimum both the time capital lies 'idle' before the start of production, in the form of raw material and product components, and in limiting the period that stocks of commodities have to be held after they have been finished. One of the ways in which the circulation of capital can be speeded up is precisely that of forcing subcontracted firms to deliver components 'strict on time'. For the managers of Japanese corporations, and their international competitors, know fully well that the time needed for circulation of commodities exerts an influence on the mass of value they can produce. 'Kanban' serves to eliminate barriers to the realisation of capital, at least for those who can impose the rule. Here, as in the case of the development of communications, capital's intent - to bring down circulation time to the next possible to zero.

Notes

1. Cited from Anand, *Crucible of Capitalism and Feudalism*, op cit, p 302.

2. A striking instance of the application of the Japanese model of subcontracting is the company Hindustan Lever in India, which is controlled by the British/Dutch Unilever corporation. In contrast, Hindustan Lever's management is taken to subcontracting partly as a reaction to factory worker resistance. See the results of the academic investigation undertaken by the Indian in 'Subcontracting and Inequality: The Case of Hindustan Lever in India' (Unilever Company), op cit.

3. The globalisation of Japanese management methods is briefly described in the seminar paper published by the Transnational Information Exchange, op cit, p 2. On the international market, North American and European multinational began to feel the squeeze of the Japanese, and others using these organisational principles. At the beginning of the 1980s Japanese firms brought Toyotism to the US with their 'lean plants'. At the same time American companies impressed with Japanese efficiency and competitiveness started to introduce elements of Toyotism. By the end of the 1980s Toyotism had become the dominant new management philosophy all over the world.

4. A good description of the historical transition from commercial to industrial subcontracting in Japan is provided by Annanaphula ICB in his article 'Japanese Subcontracting Systems' op cit, p M 23.

- 5 Quoted from the postscript by Hugo Kijne, Grahame Locke and Hans Venema, to the Dutch edition of Benjamin Coriat's book, *The Workshop and the Stopwatch – On Taylorism, Fordism and Mass Production*, op cit, p 115
- 6 See Annavajhula JCB, 'Japanese Sub-contracting Systems', op cit, p M-19
- 7 The position of women part-time labourers as 'industrial reserve army of labour' in the Japanese economy is described in my essay, 'Women's Labour in the Japanese Economy', op cit
- 8 It may be noted at this point that my interpretation of Japan's success story differs significantly from the analysis provided by Paul Sweezy at a time when the globalisation of Japanese management techniques was just starting. In his essay 'Japan in Perspective' (1980, op cit), Sweezy discusses factors like the effect of the Korean War (1950-1953) on the recovery of the Japanese economy, and the massive growth in both Department I (the sector producing means of production) and Department II (producing means of consumption), but does not address the specific Japanese methodology of industrial exploitation.
- 9 For further details regarding the destruction of the craft knowledge of the workers and the rise of Fordism, see in particular chapter one of Benjamin Coriat's book *The Workshop and the Stopwatch*, op cit, pp 18-32
- 10 See Harry Braverman, *Labour and Monopoly Capital*, op cit, p 109. It may be noted that Marx in his *Grundrisse* discussed the appropriation of the workers' knowledge as the absorption of this knowledge in the instruments of production, in machinery. Thus: "The development of the means of labour into machinery is not an accidental moment of capital, but rather the historical reshaping of the traditional, inherited means of labour into a form adequate to capital. The accumulation of knowledge and of skill, of the general productive forces of the social brain, is thus absorbed into capital, as opposed to labour, and hence appears as an attribute of capital, and more specifically of fixed capital, insofar as it enters into the production process as a means of production proper" (op cit, p 694)
- 11 See Harry Braverman, op cit, p 112-13
- 12 As Antonio Gramsci stated the point in 'Americanism and Fordism' 'Taylor is in fact expressing with brutal cynicism the purpose of American Society – developing in the worker to the highest degree automatic and mechanical attitudes, breaking up the old psycho-physical nexus of qualified professional work, which demands a certain active participation of intelligence, fantasy and initiative on the part of the worker, and reducing productive operations exclusively to the mechanical, physical aspect' (op cit, p 302).
- 13 See Harry Braverman, *Labour and Monopoly Capital*, op cit, p 241.
- 14 See Muto Ichiyo, *Class Struggle and Technological Innovation in Japan since 1945*, op cit, p 35
- 15 Figures regarding the quantitative increase in the number of quality control circles are mentioned in Jacob Mankidy, *Human Resource Management*, op cit, p M-57.
- 16 Quoted from Muto Ichiyo, op cit, p 36. The Seminar paper of Transnationals Information Exchange notes as 'the fundamental contradiction of Toyotism' that workers on the one hand are involved in thinking about production structures and processes, but on the other hand are refused 'the right to true self-determination' (op cit, p 9)
- 17 Quoted from Antonio Gramsci, 'Americanism and Fordism', op cit, p 310. In his essay, Gramsci devotes a specific section to the theme of 'High Wages' (pp 310-13)
- 18 The seminar paper of the Transnational Information Exchange notes that the introduction of Japanese management techniques is often accompanied by factory closures, the dismissal of trade union activists, and a reduction in wages. Examples discussed are those of New United Motor Manufacturing (NUMMI), a joint venture between General Motors and Toyota in Fremont California, which 'became a model for other companies worldwide', and the Ford-Cuautitlan factory near Mexico city (op cit, pp 3-4)
- 19 A major part of the second volume of Marx's *Capital* is devoted to the theme of the turnover time of capital (op cit, p 156).
- 20 The point is noted, amongst others, by Benjamin Coriat in *The Workplace and the Stopwatch*, op cit, p 57
- 21 See Karl Marx, *Capital*, Volume I, Chapter XIII on 'Co operation', op cit, p 305
- 22 See the section 'Passage of Modern Manufacture, and Domestic Industry into Modern Mechanical Industry. The Hastening of This Revolution by the Application of the Factory Acts to Those Industries', *Capital*, Volume I, op cit, p 442
- 23 See my overview of the theoretical debate in the women's movement regarding women's labour, *The Debate on Women's Labour – Historical and Theoretical Perspective*, published in Bengali by Shilpa Sahitya, Calcutta, 1992.
- 24 For a lively account of the intense pressure experienced by Japanese workers employed to work on the assembly-line, see the diary of the Toyota-worker Satoshi Kamata, *Japan on the Passing Lane*. As the author notes, the system of assembly line production is extended to the subcontracted firms, and the system of 'kanban' provides the connecting link: "The assembly lines in the supplying firms are synchronised with the assembly lines in the Toyota-factories. This 'kanban'-method which has been hailed in the media, is actually intended to ensure the deliverance in time by the subcontracted firms. It forms a further proof of the increasing synchronisation in industry. Even the streets between the supplying firms and the Toyota factories are considered to be assembly lines which connect the actual assembly lines in the factories with each other" (op cit, p 142). This quote well illustrates the close interconnection between Fordist reduction of stocks and Toyotist reduction of stocks.
- 25 The history of Fordism indicates that the victory of Toyotism over the trade union movement may well be temporary. As the seminar paper of the Transnational Information Exchange states, it took several decades for American unions to catch up with Fordism: "Until the sit-in-strike at General Motor's Flint car plant in 1937 (during which the United Automobile Workers Union was born), it was thought impossible to organise the deskilled and semi-skilled assembly line workers into a union" (op cit, p 4)

Ethics and the Indian Manager

R C Sekhar

Organisations caught up in the tough world of competitive survival have found it difficult to make their ethical missions congruent with the traditional systems of management controls. The IIMs in India do not have as yet compulsory courses in ethics. This article makes a case for ethics in business, not just as a rhetoric but as a socially useful basis for action.

THERE is an unmistakable surge the world over in the demand for managers who are trained in ethical thinking; business ethics cannot in the circumstances continue to remain a mere rhetoric for long. Stark (1993) estimates that there are 500 courses in the US, 25 textbooks and three academic journals all devoted to business ethics. Harvard starts pounding its students on ethics right from the first semester. And if ethical philosophy of business had any innate tendency to get stuck to its rhetorical moorings, Stark shows how it could, and selectively has, learnt to become a very relevant and practical area of management education. But, he basically assesses the viability of an educational tool in the classroom and not its impact in the field. More recent reactions from the field indicate that there is still much to achieve. Organisations caught up in the tough world of competitive survival have found it difficult to make their ethical missions congruent with the traditional systems of management controls applicable to first line operational managers. The newly ethically educated MBAs, usually at the middle levels, are bravely trying to cope with and resolve the apparent conflict of priorities bobbing up all the time.

There have been stirrings in India also, not just in imitation but from equally deep anguish. The pioneer in this field is S K Chakroborthy (1986, 1991, 1993, 1995) of the Indian Institute of Management, Calcutta. The IIMs however do not as yet have a compulsory course in ethics; it is taught only as an optional at IIM Calcutta. Two or three other premier institutions of management in India, and the TA Pai Institute of Management is one of them, have compulsory courses on ethics in business. Each one of them has its own framework for teaching. We are now at the brink of a public debate as to how to ensure that all this passion is just not rhetoric but socially useful basis for action. The good intentions behind all of these frameworks being accepted, they have nevertheless to be tested carefully and pragmatically.

The expression 'rhetoric' is used in the sense of a high-sounding declamation which is intended to impress but is of no use for practical action towards achieving its explicitly stated objectives. It could also mean that its unsaid objectives are at variance with its stated objectives and the declamation is really an attempt to divert the attention

of the listener. Here are typical examples of rhetoric in ethical declamations made to students of management or practising managers. 'There is only one way we can bring ethics to the world and that is by the overthrow of capitalism', or 'bringing in the raja-rishi concept in our lives discovered by ancient Vedic India', or 'cleansing the mind by Integral Yoga', or 'preserve the purity of teachings of the Quran', or 'apply the teachings of the Buddha, Gandhi or Christ to humanity', or 'ensure free markets so that profits motivate people', or 'make the minimum number of laws for ensuring uniform rules of the game in a free market and penalise sharply anyone breaking the laws', etc.

Every one of the above statements is frequently made by some or the other school of thought of ethical and economic philosophy. But on their own, they fail to give any practical meaning to a choice of managerial action. They have, however, usually provided a convenient alibi for the manager to act so as to be able to indulge in his/her own wants and desires. This is legitimised by saying that till the world changes to the creed declaimed, it is certain one can do nothing more than 'follow the crowd'. Stark (1993) shows that no sooner extensive teaching ethics to managers became a reality, those who were teaching them were confronted with the stark lack of relevance of such an approach to the real issues faced by managers in their work. Arun Monappa (1987) of IIM, Ahmedabad showed that much of religious preaching in the country by institutional religions was perceived as totally irrelevant by the business community and business managers. Eight years later, today, the situation in India has not changed; as shown from field studies reported later in the article.

Statements such as the above would not be a 'rhetoric' if made in some other circumstances by policy-makers, social reformers or activists. For example, when young revolutionaries threw themselves against the barricades and declared themselves for liberty, equality and fraternity or when Marx and Engels wrote the Communist Manifesto or Lenin went across in a sealed train to take charge of the Russian revolution, or when a Naxalite charges against the government, or when the Americans declared independence and followed it up by adopting a Bill of Rights,

or India evolved the Indian Constitution or when the Buddhist monks and Ashoka preached peace. These would have been directly relevant for action. But that is not the role we seek for the average manager.

Again, if now such preaching is done to gain votes for anyone or give the strident declaimers a perpetual prominence in public affairs trading on peoples frustrations, it would be a detestable way of using 'rhetoric'. Having cleared some of the definitional issues by descriptive illustrations we would now proceed with the basic substance of the paper.

The nature of alternatives needing the working out of ethical trade-offs in business organisations are varied: (i) product choices, (ii) pricing policies, (iii) process choices, (iv) environmental issues, (v) employment practices, (vi) career advancement decisions, (vii) customer policies, (viii) purchase decisions, etc.

One may view these issues from the slightly differing perspectives of the ethical role of the decision maker. The roles one may assume are, firstly, harmonising oneself with the organisation; secondly, taking policy decisions as the final authority; thirdly, setting the organisations ethically right, or fourthly, setting social norms as leaders of society. There is undue emphasis on the second role with reducing importance to the third role and the fourth role in that order in the current western literature. Current Indian literature has on the other hand a greater emphasis on the fourth role. But the first aspect, namely, the need for harmonising is more ubiquitous for the managers. As Solomon (1994) mentions, "Policy disagreements are irrelevant... most employees do not make policy... moral dissensions with implied policies is the more appropriate concern of business ethics", i.e., the problem of most modern managers is not to lay down the 'dharma' but to cope with the tensions with the laid down dharma. But contrary to the situation of Arjuna of the *Gita*, the present-day manager has not only to take decisions in a dilemma but carry his team along.

Further, there are limits to ethical choice by the circumstances of one's birth. In strongly caricatured style William Fredrick (1986) describes the situation and criticises the approach of normative ethics:

Now enter the philosophic ethicist, speaking the sweet voice of reason and urging adoption of abstractly attractive ethical principles and

categories—ethical analysis (has to deal with) the reality—the observed fact—of value conditioning within socio-cultural context—not with wishfulness—the locus of ethical systems that drive individuals, organisations—and societies along certain pathways—are according to certain culturally and genetically induced principles [quoted in Bowie 1986:358].

Fredrick revolt against an excessive reliance on ethics of 'ought' with little consideration for what 'is'—shifts the focus from ethics as a finished product to an ethical discourse as an ongoing process.

Thus a typical manager no doubt has several ethical choices which need education to select from. But they are all hemmed in by the circumstances and the antecedent history of the organisation and society. This contextual character of ethical processes of managers or any others is well appreciated by philosophies of vastly differing and even contrary inspirations. Thus David Hume—who is the father of modern scientific rationalism—and *Bhagavad Gita*—which invokes divine inspiration—both recognise this.

ETHICAL PLURALISM

If ethical training for a manager must have a close nexus with what 'is'—it becomes imperative that a very important part of ethical education must be an understanding of reality—the economic institutions, social institutions, the norms of law and most of all the basic nature and extent of socialisation. Are the people in this country fatalists or at the other extreme profit maximisers? Are they deeply imbued with respect for institutional religion and fundamentalism or do they have greater respect for symbols of emerging institutions in the country which have common features of the international traditions of democracy and free choice? Do they believe in 'duties' as the basis of ethics or rights? Are they lone wolves or have they cultivated a sense of bonhomie? Are they consumerists too ready to be corrupted by the global markets or are they guided by more basic values?

One may not be able to give a firm answer to any of these questions but one can broadly see if the dramatised versions of depravity and corruption—religious mania and hatred which is rending the air today—are truly representative of the people. The criminalisation described in the Vohra Committee, or the picture thrown up by the great Indian bank scam—are no doubt aspects of Indian reality. But how common is this depravity that an ethical manager would have to constantly and continuously battle with it all the time? Should this vision of India colour, distort and damage their outlook of optimism and trust?

A quieter and less demonstrative method of objective field inquiry by the students

of the TA Pai management institute (see Appendix) shows that the reality may be much more hopeful and the future of ethical processes could well be much more in the great humanist tradition which unfolded itself with the French revolution, the American revolution, the Russian revolution and the Indian Constitution their aberrations notwithstanding. Thus market systems of exchange of goods and services are considered more likely to offer systemic ethicality as was the hope of Tom Paine—the great and fiery philosopher of individual liberty and liberalism [Paine 1792], but very significantly 'organised workers' thought otherwise. The surprising evidence of bonhomie and compassion among the Indian people and their rugged ethical base was a learning experience for the students. The disenchantment of the Indian people with institutionalised religion as ethical aids came out boldly. Also is evident their greater faith in the symbols of modern outlook—e.g. teachers were ranked far higher than religious leaders as role models. Modern means of watching ethical accountability are valued—e.g. activism, law and journalism in that order. Prayer and religious exhortation and formal religious beliefs are considered to be totally weak methods of society regulating its ethics. Not praying is considered no sin at all but not caring for the aged a cardinal sin even more than taking bribes. Professional backgrounds affect one's faith in ethics but never to damage it totally. Indian MBAs are far more unwilling to sacrifice ethics for achievement than Indian engineers or US MBAs. But unfortunately they are somewhat self-righteous and feel that the 'others' (i.e. other than themselves) are more easy in bending over backward in ethics to succeed in life. In summary the ethical climate is one of ensuring a fair balance by assertion

and legitimisation of rights rather than a plea for duties, this has an exception when it typically comes to duty to the aged and women in which the appeal to duty is made. There are five implications of this for ethical education of the managers.

Firstly, the universalised model of the economic man who only works for maximising his profits is a myth. Though this assumption may be useful for broad economic analysis, it would fail as a cornerstone of social control. Amitai Etzioni (1988) has also made this point in his writings. Reality is closer to the more rounded understanding that man is a mixture of greed and bonhomie and the quality which predominates is a structural consequence. Therefore structures are as important in ethical hope as the individual. Bharthrihari also implies this in his writings. Secondly, there is an underlying appreciation of ethicality in the social psyche and unethical behaviour is likely to cause cognitive dissonance. Any person who is boldly ethical is likely to get a positive response in the long run. This feature was highlighted to the author by Amol Karnad—the MD of Alacrity Foundation—the well-known company of ethical builders who demonstrated that ethics can also pay.¹

Thirdly, the mutual distrust in the Indian psyche could have important repercussions on the ethical processes of a manager. In an interesting study Stephelo Galbraith and Grini (1994) have shown that in the US the perceptions of unethicality of others trigger unethicality of the perceivers. This would mean that a major step in ensuring that cynicism does not play havoc on the manager is a process of building trust in people. Fourthly, paternalism is not the ethical expectation of the day but respect for democratic choice is. Therefore an ability

TABLE I: DEONTOLOGICAL AND TELEOLOGICAL SCORES OF SAMPLE POPULATION

Occupations	Deontological Scores	Teleological Scores	Average Age
Group I Realists			
1 Shopkeepers/hawkers	2.23	2.95	36
2 Senior executives	2.44	2.06	46
3 Engineering students	1.88	1.87	21
Total Group I	2.24	2.80	37
Group II Pious Duty Bound			
4 Blue collar workers	2.81	2.31	40
5 Manual workers	2.89	3.00	34
Total Group II	2.85	2.68	37
Group III Aggressive Moralists and Idealists			
6 Housewives	3.10	1.90	41
7 Medical students/doctors	3.38	2.61	26
8 Non professional college students	3.00	2.56	21
9 Delhi MBA students not yet initiated to ethics	5.00	1.00	22
Total Group III	4.63	1.66	26
Total all groups	3.24	2.05	34
10 Perception of Delhi MBA students of others	0.00	4.00	

Notes: Differences within groups not statistically significant except in the case of the Delhi MBAs i.e. item 9. Difference between groups on account of occupation unlike in age is statistically significant at 96 per cent confidence level.

to understand and work for mutual self-fulfilment has to be a profound feature of ethical abilities. Fifthly, ethical expectations have multi-dimensional features and have subtle nuances which aggregation and oversimplification would fail to capture.

The fourth and fifth needs of ethical learning of the previous paragraph would clearly point to the compulsive requirement of a pluralist approach to ethics. Pluralism could be defined as a rejection of the destructive quest for some *summum bonum* and recognises that the legitimate ends of life are many and there are wide varieties of good and moral lives and that there need be no blueprint for heaven. It was typical of Indian philosophy that it developed a model somewhat like that in the realm of religion and philosophy.⁴ But very importantly, there is some, but very much less, evidence of pluralism in ethics, compared to religion and metaphysics. The ethical pluralism of India is not pluralism by choice but a relativistic plural ethic thrust upon persons.

Marxist analysts like Kosambi (1964:209, 114), have been unable to comprehend this autonomous growth of pluralism in philosophy. Their analytical frameworks worked on the assumption of a one-to-one correspondence between ethics on the one hand and metaphysics and religion on the other, between 'relationships of production' on the one hand and 'the superstructure' on the other. Perhaps we have only to look towards modern Indian authors, for some fresh air on ethical pluralism.

In more practical terms what would pursuit of pluralism mean? It could mean the extensive use of three concepts: minimalism, meliorism and public discourse.

Firstly, in applying the concept of minimalism we could use three typical operational instruments and one attitudinal back-drop. We would put the minimum number of don'ts of ethics in our criminal legislation. The choice of these is based roughly on an understanding of the 'stochastic probability' of socially undesirable action of the members, without the law and if there were a law. Waddington's (1967) concept of ethics of stochastic processes is described by Hardin (1988) in the overall context. These changes in 'probability' could guide the formulation of the law. We would put the minimum conditions to ensure fair rules of the game in our civil legislation. We would provide maximum flexibility in application in our procedural law, administrative law and case law.

Secondly, as an attitudinal back-drop we would cultivate a strong approach of meliorism in our educational systems. Meliorism can be defined as an aspect of pragmatic ethics [McDormitt 1986] owing much to the American philosopher, John

Dewey. Modest but deep pragmatic morality calls upon us to a life of 'meliorism', a life in which we effect no ultimate solutions, yet stress to make things a little better. The consequences of a 'total solution' may create still more problems. It hovers dangerously between ethical absolutism and ethical expediency. Indian meliorism took the shape of tolerance towards frailty or overwhelming importance of love in ethics (depending on the way one looks at it), typically embodied in the Krishna legends, this exasperated humourless Marxists like Kosambi [Kosambi 1964:115]. A very perceptive and sensitive understanding of this is available in a recent book of deep teutonic scholarship by Hardy (1995).

Thirdly, there is a need for transparent open discussions by a multiplicity of spontaneously formed publics [Habermas 1979, 1989, Craig 1993]. Habermas, a neo-Marxist, sees this desirable condition of democratic discourse, existing nowhere in the world, in capitalist or in socialist countries, the west or the east. But that is no reason we should revert to an elitism in ethical dispensation which is implicit in some of the variants of "back to the Hindu roots" [Chakroborthy 1995]. Pluralism does not necessarily mean a

cynical and pessimistic acceptance of a dismal status quo.

We could close this discussion on pluralism by referring to its tendency to gravitate towards a minimalist ethics of don'ts and leave the do's to individual decision. Chakroborthy, however, argues forcefully that this turning back from paternalism, however controlled and well-intentioned it may be, could be extremely psychologically destructive. It could also overdo the ethics of rights and neglect the ethics of duties. [Chakroborthy 1986, 1991]. This, he says, is extremely harmful to society. Needless to say that a maturity of understanding could guide one towards a 'middle-path'.

'MIDDLE PATH' OF ETHICS

Moral philosophers of the free market economy would say that the cheapest way of 'doing the greatest good to the greatest number' is allowing individuals to define what is good for themselves. The magic formula of 'market prices' would determine how people would value each other's goods and services and make it the basis of exchange. This would enable the society as a whole to move towards optimal allocation of resources and ensure maximum efficiency of operations. It could even allow the

TABLE 2 BELIEFS REGARDING HUMAN BEINGS AMONG SAMPLE POPULATION

Statement	Score (1 to 3)	Significant Patterns
1. Human beings are selfish and need compulsion to be ethical	2.00	Significant diff. between occupations (93 per cent Confidence). Shopkeepers/engineers agree. Housewives/doctors disagree. Correlates with deontological scores in Table 1.
2. Human beings are victims of socio-pol pressures forcing unethical behaviour	2.00	Significant difference between occupations (99 per cent Confidence). Correlates with deontological score in Table 1.
3. Religious leaders can settle (a) domestic problems (b) ethical business problems	2.36 (a) 2.30 (b)	Differences between occupations and ages and (a) and (b) parts statistically insignificant.

Note: Scores 1: totally agree, 3: totally disagree and 2: intermediate position.

TABLE 3 ETHICAL ROLE MODEL FOR SAMPLE POPULATION

Role Model	Score	Rank	Significant Patterns
Group I Highly Regarded			
Teachers	1.89	1	Very high for housewives and shopkeepers; very poor for engineering students and manual workers. Statistically significant.
Doctors	2.33	2	Uniform over occupation and age.
Group II Medium Regard			
Priests	2.94	3	Very poorly regarded by housewives and manual workers. Other differences insignificant.
Group III Poorly Regarded			
Businessman	4.05	4	Uniformly poor including shopkeepers themselves.
Government servant	4.30	5	Ditto.
Politician	5.47	6	Ditto except blue collar workers' significantly high regard.

Note: Differences within groups are significant at 90 per cent to 99 per cent. Differences between groups significant at 100 per cent level.

and by taking to the manufacturing of modern goods like bulbs, rubber products, western umbrellas, etc. In the footsteps of the Samurai the *tonyas* too transformed themselves. Instead of continuing to function as the link between craftsmen and the market, they now became supply line businessmen. They henceforth chose to fulfil the task of subcontracting for industrial enterprises, to act as intermediary between homeworkers and the factory. It is only when the fascist regime enforced rationalisation of production, during the 1930s that their role came under serious threat. Those *tonyas* who failed to provide technological guidance to the small producers were eliminated under the joint pressure of the fascist government and monopoly companies.

During this period, from 1935 to 1945, the system of subcontracting was developed which more recently has helped Japan build up a strong reputation amongst entrepreneurs worldwide. Partly in consequence of the brutal wars fought, the country suffered from a severe lack of raw materials. The government introduced a system of rationing industrial raw materials and imposed price regulation upon intermediaries. Most far reaching was the government's attempt to unify the subcontractors of major companies via horizontal co-operation. When the desired result was not obtained, corporate enterprises themselves streamlined the structure of subcontracting: they selected the most efficient clients and brought them under corporate control. Small supplier firms were patronised through instructors and by providing them with instruments to improve product quality. Moreover, a mutual division of labour was promoted between the subcontractors. Thus arose the typically Japanese pyramid-shaped structure of production.

The period after the second world war merely brought a further refining in methods of control over subcontractors, when the transfer of knowledge regarding financial accounting and that regarding management techniques were added to the regulatory mechanisms. The proportion of production which is sub-contracted has greatly expanded during recent decades. This is true in particular for the automobile sector, where the share of production that is sub-contracted amounts to 70 per cent at least. In short, and contrary to Marx's expectation, the factory system of production has not completely replaced the network of small producers, but has rather subordinated them. It has adapted this network to the needs of corporate capital.

Before discussing the effects of this elaborate system of subcontracting on labour, I wish first to comment on the second central aspect of Japanese style company management: the labour groups or 'quality circles'. Once more a historical review is helpful. For Japanese companies have employed the idea of labour groups for the purpose of enhancing productivity for long decades. Examples can be traced to reports regarding working conditions in textile factories, the spinning and weaving mills, where women a century ago worked to lay the foundations of Japan's industrialisation. Thus, groups of female labourers, employed in textile companies and organised along district lines, in the beginning of the 20th century engaged in sports competition initiated by management. The same groups were encouraged to undertake production competition by offering them little prizes in reward. As early as then entrepreneurs tried to devise clever means to influence the thought processes of the overwhelmingly female workforce.

Today the system of labour groups, now baptised 'quality circles', has become a common phenomenon in almost all Japanese factories. They are to be found in the large enterprises of key industrial sectors, such as automobiles and electronics, but also in the smaller sub-contracted firms. During my visit to Japan in 1990, a woman employed in a company producing temperature regulators for Toyota trucks described how the women workers during off time are forced to jointly ponder over possibilities for raising productivity. For individual women there simply is no escape: the company manager does not just own the wage slaves' labour time, but a part of their free time as well. And when visiting the multinational chips producer Fujitsu Electronics, managers in blue uniforms self-confidently stated to us that the factory's labour groups provide a guarantee for production without an undue number of errors. Thanks to the quality circles the workers are perfectly disciplined. In other words, the ideal of the 'trained gorilla', which American corporations earlier tried to reach through the use of the stopwatch, has to a frightening extent been realised in contemporary Japan.

In western countries, the discussion about labour groups is not completely new either, as is evident e.g. from the postscript to Benjamin Coriat's book on the history and significance of Fordism: *The Workshop and the Stopwatch*. In many enterprises such groups were introduced in the late 1970s or

early 1980s, in name of 'the humanisation of labour'. The significance of the system according to the mentioned postscript is as follows: "Place him, or the migrant worker or the female labourer, in a team or 'collective' which itself decides on speed and working rhythm. Time- and motion-experts with their stopwatches in their pockets are no longer required, nor are foremen who watch you, the worker, from behind. You yourself can decide how you want to work and how fastly." In other words, the formation of labour groups eliminates the need for detailed supervision. Contrary to the Fordist/Taylorist approach, the individual is no longer the basis of the labour process; it is the group that is considered its foundation. Moreover, "Since the income of the team, i.e. of all its individual members, is dependent on the productivity of each separate member, there is little chance that the group will show benevolence towards a 'lazy worker'." The structure of the quality circles ensures strict self-discipline on the part of the exploited workers.

The new method which Japanese companies are teaching to their competitors, however, consists of more than the above sketched trend towards (what can schematically be termed) internal decentralisation. At issue is a phenomenon on the borderline between internal and external decentralisation: extensive competences are transferred to smaller production units within the factory complex. Such units tend to be granted a close to independent status. Responsibilities are delegated, flexibility is promoted, while profits continue to flow towards the corporation itself. The extent of influence the model has developed internationally can be illustrated by citing the example of the Dutch steel-foundry Hoogovens. The territorial size of this foundry's complex, its production structure, until recently was an integrated one – is equal to a whole town. According to the masterplan formulated by 'Hoogovens' management, the factory complex is to be restructured along the model of the Japanese company Nippon Steel: the granting of far-reaching autonomy for the various sections/departments, and the devolution of tasks even with regard to marketing and the sale of steel products.

The key question remains of course whether such decentralisation really leads to 'the humanisation' of labour relations. According to a trade union researcher whom I interviewed in 1990 about the consequences of the trend described – the splitting-up of production into smaller units aspired to by

many Dutch companies outside the steel sector leads to the sidetracking of trade unions. Relations between management and trade unions become increasingly nebulous. It becomes more and more nuclear at which level negotiations about labour conditions should take place, which trade union a specific group of workers should join, etcetera. In short – the major danger being posed is decreasing solidarity, 'desolidarisation', between the workers and the further weakening of their collective power.

Above I have already given an outline of the historical evolution of Japanese subcontracting: the elimination of traditional middlemen and the vertical integration of subcontractors under the modern, industrial corporation. The corporation's relation with small supplier firms presently is primarily regulated via the principle of 'kanban', i.e. delivery of components or product parts just-in-time. This principle, can be wholly understood within the framework of classical, Marxist economic theory. What I wish to elaborate on first are the immediate social and economic consequences of subcontracting organised on Japanese lines. We should realise above all that a large degree of dependence is consequenced by the system. In the typical Japanese company, the so-called 'keiretsu', only the first line of subcontractors is directly owned by the mother company. Smaller supplier firms, on the contrary, are formally independent. Yet since in practice they generally are up to 100 per cent dependent on the orders of one particular corporation, they are virtually subject to the latter's arbitrary rule.

Subcontracting of product components in essence means that the Japanese automobile corporations and electronic companies are exempted from the fluctuations of the domestic and international market. Because small subcontractors are independent, the corporations are in a position to transfer market risks: in times of crisis not they, but the smaller fry are made to suffer. Thus, many Japanese industrial enterprises during the oil crisis of the 1970s demanded delivery on credit from supplier firms, by simply delaying the payment of components obtained. And when the yen suddenly rose in value in relation to other currencies, raising the price of crucial Japanese export products like automobiles and electronic gadgets – a price reduction was imposed upon the dependent and rather powerless firms supplying components. In the Tokyo area a reported 45 per cent of all firms were made to face these consequence of the 'yen-spiral'.⁶

Yet the ultimate victims, having to face the brunt, are the male and female labourers

employed in the subcontracted firms. They are forced to make many hours of overtime, and in times of crisis are the first to be threatened with lay-offs. The secondary status faced by the majority of the Japanese labour force is well-illustrated by the working conditions applying to part-time labourers in Japan. From interviews taken of women workers in Japan it clearly emerges that many subcontracting companies, employing 100 persons or less, make extensive use of 'part-time labourers', women performing wage labour up to 7 1/2 hours per day (!), who earn wages calculated on an hourly basis, and who are paid less than half the amount earned by male employees in fixed service, their rate is 500 to 600 yen per hour at most. Many middle aged women in particular belong to this vast labour reserve. Since they can be dismissed at any time, they are termed 'throw-away-articles' in the Japanese press – analogous to the throw-away-sticks used by Japanese consumers to take their meals.⁷

Both the Japanese government, the major corporations and the right-wing trade unions actively work to maintain these deplorable labouring conditions in subcontracted firms. They jointly ensure that the method of transferring risks to the workers remains firmly entrenched. The corporations themselves transmit knowledge about the labour groups, i.e. the quality circles, and they put pressure on the 'independent' suppliers to ban any trade union activities. The government contributes its share by issuing laws in favour of part-time work, and by promoting the growth of a system of 'manpower agencies'. Similarly, the powerful trade union federation Rengo has implicitly accepted the prohibition on trade union work in small supplier firms. Such is proven by functionaries representing Rengo. A regional secretary whom I spoke to in Japan defended the fact that Rengo only protects the interests of the relatively privileged layer of fixed employees by citing as argument that the undertaking of organisational work in subcontracted firms would lead to the loss of orders for such firms. In other words: the decentralisation of production and the silencing of most severely exploited groups in society are part and parcel of the very same Japanese 'model'.⁸

FROM AMERICANISM TO JAPANISATION

During the 1960s and 1970s, progressive authors ardently studied and analysed the Taylorist/Fordist system, the management methods which as explained above were

introduced in the early part of this century in order to promote the mass production of commodities. The French author Benjamin Coriat for instance has given a lively description of the features and advantages (to capital) of the Fordist/Taylorist system. One of the key advantages he ascribes to the assembly line and the stopwatch is the "breakdown of the independent knowledge of the trained craftsmen over the production process". In the very period of capitalism's ascendance, entrepreneurs realised that the independent knowledge of the workers over their own production provided them with considerable power. This power limited, Coriat argues, the control entrepreneurs could exercise in the historical, first phase of capitalist production. It made them dependent on the physical presence, in the locality of their operation, of people knowing the ins and outs of the given trade.

This dependence on the craftsmen's knowledge forms the background to the struggle waged in England during the 19th century over the (proposed) lifting of the ban on emigrations. Many skilled cotton workers in the Lancashire region wished to leave in the second half of the century, since they were famished due to (temporary) unemployment. Their impending exodus was fiercely resisted by manufacturers, and triggered a debate in the British Lower House – a debate which was won by proponents of maintenance of the emigration ban. The manufacturers outspokenly stated their interests: "Could one imagine a more disastrous plan for all classes of the country than to weaken the Nation by exporting its best labourers?" The owners of British textile factories could not dispense with a skilled workforce. The presence of many unskilled workers in the US, on the other hand, facilitated the introduction of the methods propagated by Taylor and Ford – the chronometer and the assembly line. During the period 1885-1915 alone, 15 million people migrated to the US – most of them semi- or unskilled workers. Thus, American entrepreneurs could rather easily launch an offensive against skilled workers who temporarily tried to defend their jobs by relying on the principle of the exclusive workshops ('closed shops'), and on labels which in name guaranteed the quality of the commodities ('blue labels').⁹

The Taylorist phase of mass production caused fragmentation of production tasks and an accompanying breakdown of skills – changes which enhanced the power of entrepreneurs over the whole production process. According to Coriat, the time and motion studies of experts used to discipline

the workforce were explicitly aimed at facilitating the massive integration of unskilled immigrants into the industrial production process. They were aimed at making craft workers superfluous. The system, however, was not bereft of disadvantages. Its main drawback was that the remaining knowledge possessed by the workers, their creativity, could not be optimally used. 'Japanisation' in my view signifies that a solution has been found to this drawback of Fordism. Male and female workers organised in labour groups, both in the large corporations and in subcontracted companies, are obliged to wreck their head over production problems. They are forced to constantly think about how to increase production efficiency. It is often said in Japan that workers employed by Toyota think 24 hours a day about production. Japanisation thus signifies the effective appropriation of the remaining knowledge and insights of the workers. Their knowledge is permanently tapped.

Since both Taylorism/Fordism and Japanisation are crucially concerned with the effective use of and control over human knowledge, it is useful to further elaborate on this theme. Harry Braverman, the American author of a classical study regarding the work processes under monopoly capitalism, has analysed the evolution of technical knowledge and its application by capitalist corporations up to the 1970s of this century. Just like the Frenchman Coriat, he stresses that at the dawn of capitalism the skilled worker was the repository of human techniques required in the labour process of his/her particular branch. The craftsman/woman, the potter, the tanner, the smith etc., combined in hand and body, the concepts and physical dexterities of the speciality, and his/her technique was the predecessor and progenitor of science.¹¹

Now, the history of the conquest of technical knowledge, its appropriation by the capitalist from the skilled worker, has long been blurred by modern science. Yet the aim of this conquest, and the methods to achieve it, were quite explicitly stated by Frederick Taylor. Taylor set out a war aimed at convincing the American entrepreneurs of his day that they should develop a complete 'monopoly' over knowledge so as to "control each step of the labour process and its mode of execution". He advised that first the managers should "assume the burden of gathering together all of the traditional knowledge which in the past had been possessed by the workmen", and second, that "all possible brain work should be

removed from the shop and centred in the planning and pay out department".¹² Indeed Gramsci's interpretation referred to in the introduction was very precise: the purpose of Americanism was to break up the old psycho-physical nexus of qualified professional work.¹³

The separation between conception and execution proclaimed by Taylor as a cardinal principle of capitalist control has historically given rise to the creation of a new profession: the profession of the technical engineer. In the US, as Braverman records, there existed as few as 30 engineers or quasi-engineers in the year 1816. The first census which mentioned the profession as a distinct one showed a number of about 2 000 engineers, "few of whom had gained their titles through academic training" and most of whom were engaged in canal and railroad construction. It is only in the last two decades of the 19th century that the number of engineers rapidly expanded; only in the 20th century did they become a mass occupation: there were some 1.2 million technical engineers bearing responsibility for conceptualisation and planning of production in the year 1970.¹⁴

Seen against this background it is more than ironic that in the last quarter of the 20th century monopoly capitalist corporations have abandoned Taylor's insistence on the strict separation between conception and execution, his open advocacy of dehumanised labour. Whereas on the one hand the engineering profession is being undermined partly by the development of computer technology and the growth of an army of data workers engaged like engineers in the task of conception and planning, on the other hand Japanese companies have commonly instituted quality control circles of shopworkers engaged in studying work processes and potential improvements in work methods. Yet before concluding as monopoly capital would like us to that what is at stake is the 'humanisation of labour', let us have a closer look at the functioning of Japanese quality circles.

The spread of the quality control circles, a system that has greatly contributed to the superiority of Japanese automobile concerns and other multinationals over their European and American competitors, is a rather recent development. It is true as argued above that 'labour groups' engaged in production competition have existed in Japan since the founding period of industrialisation. In the late 19th and early 20th century textile companies organised speed-up campaigns, i.e. they sought to intensify exploitation through competition between groups of women workers. Yet the

idea of quality control in the form of zero defect drives has reportedly originated in the US missile industry. It was brought to Japan in the late 1950s by the Japan Productivity Centre. According to Muto Ichiryo who has specialised in Japanese industrial relations since the second world war, the idea was 'wedded' to the pre-existing small group concept.¹⁵

As Ichiryo and other sources confirm, the quality control circles mushroomed during the 1960s and 1970s. In 1962 there existed just 23 such circles. By 1980 the number had increased to well over 100 thousand! The Japan Productivity Centre held a survey in 1976 which brought out that 71 per cent of the country's companies had instituted quality control circles. In big enterprises, employing 10 000 workers or more, the figure reportedly was as high as 91.3 per cent. One sector where quality control circles gained early ascendancy was the sector of steel: the Kawasaki plant of Nippon Kokan Steel implemented quality control drives already in 1963. By the 1980s the same plant then reportedly employing 8 000 persons counted 1 320 quality control circles, indicating that the company's whole workforce had been mobilised to participate.¹⁶

Through the quality circles Japanese companies have in a sense broken with the tradition of Taylorism which had hoped to reduce workers to virtual animal extensions of the machine. To a very limited extent, and in a distorted manner, Japanese companies have restored the nexus between the workers' physical and mental activity, once again as in pre-Taylorist days workers are permitted to hold some knowledge over their immediate labour process. Still it would be very wrong to conclude that capitalism is bent on restoring the workers' original craft knowledge, for the workers' domain of knowledge is carefully delineated by the enterprise. It remains confined to his dehumanising, fragmentary production activity. And whereas the quality circles are forced to provide management with scores of suggestions on how to cut production costs, on how to reduce production errors to the barest minimum, the power to decide to use the workers' bits of knowledge remains entirely management's.

Lastly, let us note the following contradiction between the ideology and the practice of Japanisation. Proponents of Japanese management styles argue that the quality control circles represent a form of 'participation by the workers in management', a form of 'self-management' ('Jishu Kanri'). The stark reality is that the quality circles help to further undermine

whatever workers' autonomy formerly had existed in Japan. The groups are instructed to convene and discuss problems of production-efficiency after the official working times. In general, the labourers are not paid any overtime for participating in the groups. In other words, the quality circles represent an unpaid extension of the labour day, a form of intensification of exploitation. Most alarming is, as Muto Ichiyo notes, that the quality control circles have usurped the role of workers' activism. "There is no room left for union activity to intervene, since all available time and energy of workers are absorbed by the company."¹⁶

One purpose of the Fordist/Taylorist system was to ensure workers' loyalty to large corporations by paying them relatively high wages, by introducing pensions, a social security system, etc. Ford, owner of the American automobile company, was an outspoken proponent of making economic concessions – to a select group of workers – in order to suppress the tendency towards resistance in key sectors of the capitalist system. The striving to build a labour aristocracy has been consciously pursued since the beginning of the century. Coriat concretely depicts how Ford conceived of his 'high wages' – idea. In 1915 he announced a big increment in the nominal level of wages; the pay rise involved no less than a doubling of wage-rates, up to 5 dollars per day (hence the slogan of the 'Five Dollar Day'). The immediate background to this step was a huge turnover in workers at Ford and other companies in the automobile city of Detroit. In 1913 alone 53,000 persons were recruited to fill a number of 15,000 jobs. Moreover, the city was beset with a mood of rebelliousness which Ford decided to counter by increasing the level of wages.

This last mentioned motive of Ford's was well understood by Gramsci in the loneliness of his prison cell. In *Prison Notebook* he amongst others discusses the Fordist 'ideology of high wages'. He argues that the American companies could only pay their high wages because they held a position of monopoly, which was not to last for ever; high wages besides were not being paid to all American workers, but only to those belonging to the 'labour aristocracy'; and the high wages were paid with the sole motive of keeping the workers in line. Though the entrepreneurs according to Gramsci purposely strived to transform the workers into 'trained gorillas', i.e. 'without workers' consciousness, they nevertheless continued functioning as thinking human beings, which the entrepreneurs understood.

"And not only does the worker think, but the fact that he gets no immediate satisfaction from his work and realises that they are trying to reduce him to a trained gorilla can lead him into a train of thought that is far from conformist."¹⁷

In a 'Japanised' production structure the need for a labour aristocracy remains. Thus, there exists as said in Japan a sharp divide between the male workers in lifelong employment, and the mass of 'throw-away' female labourers. However, in a structure with extensive subcontracting relations the individual responsibility of industrialists to maintain a reasonable standard of living is greatly reduced. The payment of a 'high wage' after all only applies to a very select group of fixed workers who undertake final assembly tasks in the main factory hall. All remaining categories of workers, in particular female workers, are paid low wages, and like the automobile workers in Detroit at the beginning of this century, they can be laid off at any time. Ford added numerous conditions to his spectacular wage offer. Toyota and other mammoth corporations in Japan have ensured that the financial concessions they need to make to the working class, remain confined within narrow limits.¹⁸

One of the advantages of Ford's system of the assembly line which is frequently overlooked, is that in such a system the turnover time of capital is accelerated. Surely, an entrepreneur's chances of reaping superprofits are enhanced by the speed with which his money is re-invested. Marx had underlined the importance of the theme of the 'turnover time of capital' by devoting a whole series of chapters to this theme in *Capital*.¹⁹ In connection with capital's turnover time he first makes a distinction between production and working time: the first one is generally longer than the second (see Appendix). If wood for instance first needs to be laid to dry before being used, or in case the production time comprises a period of fermentation of grapes, it means that a part of capital is temporarily stored and that the turnover time of capital is extended. A similar phenomenon I observed in Japan when visiting a tobacco company, in 1990. We passed huge cauldrons in which tobacco leaves, as we were told, remained stored for one year before being considered suitable for the production of cigarettes. A part of the company's capital thus was 'stored' in the form of tobacco leaves.

Like the production process, the circulation time of capital – the time required for the purchasing of raw materials and for sale of the commodities produced – can pose complications for the entrepreneur. The more

time there be required to find buyers for the goods, the more expenses are incurred in consequence of the storage of these goods after the completion of production. Marx calls the period of sale the decisive part of the circulation time. On the other hand – the entrepreneur may require extra financial resources since certain raw materials are auctioned only few times per year. What is involved here is the lengthening of the purchasing time, the starting period of capital. Entrepreneurs in industrialised countries wage a perennial struggle to reduce the turnover time of their capital, to accelerate capital's circulation, hence the anti-social phrase 'time is money'. Not coincidentally, Fordism and Toyotism are both systems in which workers are under constant pressure, in which there is a continuous effort to speed up production.

However, in the two systems the acceleration in the turnover time realised differently. Let's once again refer to the French author Coriat. "Ford introduced the production without stocks", he wished to "counter the loafing of production materials", through a well-regulated supply and conveyance of all necessary materials. Ford himself is reported to have used the image of the river and its branches: the assembly line in his view served to promote a 'well-coordinated flow' of goods in the process of being produced. He was concerned primarily with reducing 'losses' in terms of money, capital, as a consequence of storage in-between various phases of production. By adopting his system of the conveyor belt many costs in connection with transport-labour were eliminated, as well as expenses made for storage of products, i.e. the maintenance of stocks of goods in between the various phases of production in the factory.²⁰

The same aim of reducing storage costs is also pursued in the Japanese structure of decentralised production. Here, however, the reduction/savings are not realised by pressing down the costs of storage during the production process itself, but by cutting down on expenses for holding stocks before and after the whole production time in the factory. The target of Toyotism is precisely the circulation time of capital. A concept which is wholly identified with the Japanese style of management is 'kanban', deliverance just-in-time. Since it is demanded from supplier firms that they deliver precisely on the minute, the second, stipulated by the company providing the order, the corporation is no longer burdened with the necessity of maintaining stocks of product components. And 'kanban' is a concept belonging entirely

to the era of the computer and the telefax, which means of communication serve capital in the very same manner: by accelerating its turnover time. In short, 'kanban' is a contemporary, Japanese concept that can easily be understood on the basis of Marx's classical *Capital*!

CONCLUSION

The era of Japanisation forces leftwing activists to seriously re-analyse the capitalist system, it even compels us to re-appraise our fundamental understanding of this social system. In *Capital* Marx presumed that industrial entrepreneurs would unwillingly dig their own grave, by bringing together thousands of workers under one roof, in one factory complex. Marx argued, as well known, that capitalism created the collective worker who more or less spontaneously would strive to overthrow the capitalist system and build a socialist society. Marx did not hesitate to equate the very gathering together of workers in one and the same building or space with the new mode of production. "A greater number of labourers working together, at the same time, in one place (or, if you will, in the same field of labour), in order to produce the same sort of commodity under the mastership of one capitalist, constitutes, both historically and logically, the starting point of capitalist production."¹

Yet in the modern Japanese model which has heralded a new phase in late capitalism, the number of workers corresponding to Marx's ideal, the collective worker, is brought back to a minority of the working class, to a minority also of the industrial labourers. Moreover, the shrewd Japanese capitalists have upset Marx's very conceptualisation of stages in capitalist production. Marx, it may be recalled, conceptualised three stages. The historical phase of home industries with its small, 'independent', producers working under the putting out system, was followed by the phase of manufacturing, in which specialised craftworkers under the leadership of one boss would labour in the same workshop. This system of manufacturing according to Marx would be replaced by the industrial system where workers would be reduced to a mere extension of the machinery. True, Marx realised that home-industries and manufacturing would not be immediately abolished by the capitalist system, would temporarily survive. Thus, the production of clothing in England was characterised by "a medley of transitional forms". Yet history would favour the factory: "the variety of transitional forms, however, does not conceal

the tendency to conversion into the factory system proper"²

'Today's reality, i.e. conditions more than hundred years later, do not support the schematic view propounded by Marx. Home-industries and mini-enterprises have not disappeared in the economically most powerful, over-industrialised country of the world, Japan. In fact, the continued existence of small subcontractors is purposefully aimed at by this country's large corporations. And although the mode of production in subcontracted firms admittedly cannot be equated with the one that prevailed in sweatshops in the earliest phase of industrial development - any profound understanding of Japanisation cannot be acquired without analysing the comprehensive network of subcontractors which is profitably maintained by Japanese and other multinational companies. It indeed is a crucial task for political economists today.

Should one then conclude that Marx is outdated, that his understanding of capitalism was wrong? Surely, the tendency to reject Marxist economics is great at a time when arrogant, racist western press reports proclaim the 'death' of Marxism. Anybody who continues to be infected with such ideas is simply branded an 'anachronist'. I nevertheless hold that the outright rejection of Marxism merely leads to intellectual disarmament, it leads to subjection to a system producing 'trained gorillas' and 'throw-away-labourers' instead of producing liberated human beings. As illustrated through the above cited example of Marx's analysis of the turnover time of capital - his conceptualisation provides essential attributes for grasping recent developments in world capitalism. In fact, we can apply to the system of subcontracting the same analytical approach as I have done in my book regarding women's labour in order to fill blind spots in Marxism the inheritance of Marxism should be expanded."³

Above I have tried to provide a description and analysis of Japanisation/Toyotism, and have drawn comparisons with the Fordist system of mass production which emerged in the US in the early part of this century. I have argued that the Japanese style of management possesses two decisive characteristics: the quality circles of male and female labourers, intended to mentally subject them to the corporation's rule and the structure of subcontracting which entails the transfer of production risks to the manufacturers of product components and the workforce employed by them. Those two elements are just as characteristic for Toyotism as were the conveyor belt and the

stopwatch for Fordism/Taylorism.

A comparison with Fordism further teaches that some 'bottlenecks' which entrepreneurs have been trying to solve ever since the industrial revolution, under the system of Toyotism are 'solved' in an original manner. Ford and Taylor hoped to once and for all do away with the rebelliousness, the spirit of resistance of the working class, through introduction of the chronometer and the assembly line. They were out to regulate factory production in a way that would help uproot from the factory the struggle against capital, the struggle for a human world. They succeeded only partly - witness for instance the wave of socialist inspired class struggle which engulfed western European countries like France and Italy during the 1960s and 1970s. Hence the force of attraction of Japan's style of management, the physical expulsion of the bulk of the male/female labourers from the factory halls and the splitting up of the collective workers in numerous small, geographically separated units.

The Japanese regime, and its application by multinationals worldwide, has already heralded a new phase in the process of capital accumulation. For the future of the struggle for a viable world it is of crucial importance that this be fully recognised. The serial production of mass commodities is not abolished in a Japanised structure, on the contrary. The Japanese automobile and electronic companies - like just their American competitors - aim at standardised manufacture of mass products on the largest possible scale.⁴ But in order to reach this goal, the internal, hierarchical relations within enterprises, and external relations, are being profoundly restructured. "The terrible strength of Fordism" Benjamin Coriat wrote, "lies in its enormous speed". In companies that are ruled by the norms of 'kanban' speed and inhuman pressure, are raised to unprecedented levels.

For the trade union movement of industrial workers - and here I not only have in mind the over-industrialised countries, but third world countries like Mexico, Brazil and India as well. Japanisation has far-reaching consequences. "Trade unions could be completely outmanoeuvred". An exclusive orientation towards the labour aristocracy, or the collective worker, as trade unions, including progressive ones, have traditionally done, is not only incorrect from an ethical point of view. In such a strategy, the interests of only the most privileged section of male employees in fixed service are defended, while those of seasonal labourers, of temporary workers - and in particular of world's largest industrial reserve army,

women – remain structurally neglected. This strategy is, moreover, self-defeating, for through external decentralisation entrepreneurs succeed in undermining the power of the whole working class. In short – the capitalist strategy of ‘kanban’, of quality circles and subcontracting, poses the need to fundamentally reconsider trade union strategies.

Appendix

MARX'S *GRUNDRISS* AND ANALYSIS OF TURNOVER TIME OF CAPITAL

In this Appendix, I wish to underline the extraordinary, actual relevance of Marx's analysis regarding the problem of the turnover time of capital. When preparing for his theoretical and practical analysis regarding the capitalist system, which he was to present in his *magnum opus*, *Das Kapital*, Marx during the winter of 1857-58 wrote a series of notebooks for self-clarification. These notebooks were to be published only a century later. They are now known as the *Grundrisse*. They have justly been termed a “sourcebook of inestimable value for the study of Marx's method of inquiry” (See the Foreword by Martin Nicolaus to Marx's *Grundrisse*, op cit, p. 7.)

Two of the notebooks comprising the *Grundrisse*, Notebook V and Notebook VI, contain extensive passage on the theme of the turnover time of capital. First, let's explain the meaning of the terminology. For Marx, the turnover time of capital refers to the whole cycle which capital completes, it refers to the composite of production time and circulation time, i.e. to the various phases capital passes through before, during and after the end of the production of a commodity (see pp 520/521 and p 618/619). Preceding the initiation of production, e.g. raw materials have to be procured, and after the commodity has been readied it has to be brought to the market. The time to cover these steps belongs to the circulation time of capital.

Now, the key question which Marx asks himself is the following. What influence does circulation time exert on the creation of value? “The question which interests us here is this: Does a moment of value determination enter in *independent of labour*, not arising directly from it, but originating in circulation itself?” (p 519?). Marx's answer is squarely positive, circulation time does exert an independent influence, and in order to illustrate the point, Marx draws a comparison. If a value four times smaller realises itself as capital four times in the same period in which a four times greater

value realises itself as capital only once, then the smaller capital's gain – production of surplus value – is at least as great as the larger's (p 519). It can even be greater, Marx says, because the surplus value can itself again be employed as surplus capital.

Thus, the calculation of circulation time proper, and of the total turnover time of capital, requires specific analysis. In order to understand an entrepreneur's capacity to accumulate, it does not suffice to know the rate of exploitation of his workforce, the surplus time extracted from his male and female labourers. We also need to take a look at the turnover time of his capital. “The sum total of values produced or the total realisation of capital in a given epoch – is determined – not simply by the surplus time realised in the production process, but rather by this surplus time (surplus value) multiplied by the number which expresses how often the production process of capital can be repeated within a given period of time” (p 544).

Marx further discusses whether circulation time is a positive or a negative value creating element. Given that a moment enters into value determination – circulation time – which does not come out of the direct relation of labour to capital (p 538), what influence precisely does circulation time exert? Marx considers circulation time a ‘natural barrier’. It is a time of devaluation. The more the circulation of capital can be speeded up, the larger the speed with which the production process can be repeated, the better this is for the owner of capital. In other words, “circulation time in itself is not a productive force of capital. All that can happen through the acceleration and abbreviation of circulation time – of the circulation process – is the reduction of the barrier posited by the nature of capital” (p 545).

The above helps explain several major contemporary trends of international capital, i.e. the specific mode of operation of Japanese companies (‘kanban’), and capitalism's drive to further develop the means of communication. The time needed to maintain stocks of commodities produced, for instance, is influenced by the time required to transmit orders. Whereas originally these needed to be conveyed by couriers or letters, with a transmission time of several days, the invention of the telegraphic system, and more recently the fax system, have brought the transmission time down to nearly zero. Thus, the development of telecommunications serves capital's need to reduce circulation time to the barest minimum. To once more quote Marx himself: “Capital by its nature drives

beyond spatial barriers. Thus the creation of the physical conditions of exchange – of the means of communication and transport – the annihilation of space by time – becomes an extraordinary necessity for it” (524).

Marx's analysis surely helps us understand the enormous popularity – among entrepreneurs – of the Japanese principle of ‘kanban’. Capital is interested in limiting to a minimum both the time capital lies idle before the start of production, in the form of raw materials and product components, and in limiting the period that stocks of commodities have to be held after they have been finalised. One of the ways in which the circulation of capital can be speeded up is precisely that of forcing subcontracted firms to deliver components strict on time. For, the managers of Japanese corporations, and their international competitors, know fully well that the time needed for circulation of commodities exerts an influence on the mass of value they can produce. ‘Kanban’ serves to eliminate barriers to the realisation of capital – at least for those who can impose this rule. Here, as in the case of the development of communications, capital's target is to bring down circulation time the nearest possible to zero.

Notes

- 1 Cited from Antonio Gramsci, *Americanism and Fordism*, op cit, p. 309.
- 2 A striking instance of the application of the Japanese model of subcontracting is the company ‘Hindustan Lever’ in India which is controlled by the British/Dutch Unilever corporation. In recent years, Hindustan Lever has increasingly taken to subcontracting, partly as a reaction to factory workers' resistance. See the results of the academic investigation carried out by Jan Franssen, in ‘Subcontracting and Inequality – The Case of Hindustan Lever in India (a Unilever Company)’, op cit.
- 3 The globalisation of Japanese management methods is briefly described in the seminar paper published by the Transnational Information Exchange, op cit, p. 2. “On the international market North American and European multinationals began to feel the squeeze of the Japanese and others using these organisational principles. At the beginning of the 1980s Japanese firms brought Toyotism to the US with their ‘transplants’. At the same time American companies, impressed with Japanese efficiency and competitiveness, started to introduce elements of Toyotism. By the end of the 1980s Toyotism had become the dominant new management philosophy all over the world.”
- 4 A good description of the historical transition from commercial to industrial subcontracting in Japan is provided by Annayaphula JCB in his article ‘Japanese Subcontracting Systems’, op cit, p. M. 23.

- 5 Quoted from the postscript by Hugo Kijne, Graham Locke and Hans Vencma to the Dutch edition of Benjamin Coriat's book *The Workshop and the Stopwatch: On Taylorism, Fordism and Mass Production* op cit p 115
- 6 See Annay Ghula JCB Japanese Subcontracting Systems op cit p M 19
- 7 The position of women part time labourer as industrial reserve army of labour in the Japanese economy is described in my essay Women's Labour in the Japanese Economy op cit
- 8 It may be noted at this point that my interpretation of Japan's success story differs significantly from the analysis provided by Paul Sweezy at a time when the globalisation of Japanese management techniques was just starting. In his essay *Japan in Perspective* (1980 op cit) Sweezy discusses factors like the effect of the Korean War (1950-1953) on the recovery of the Japanese economy and the massive growth in both Department I (the sector producing means of production) and Department II (producing means of consumption) but does not address the specific Japanese methodology of industrial exploitation
- 9 For further details regarding the destruction of the craft knowledge of the workers and the rise of Fordism see in particular chapter one of Benjamin Coriat's book *The Workshop and the Stopwatch* op cit pp 18-32
- 10 See Harry Braverman *Labour and Monopoly Capital* op cit p 109. It may be noted that Marx in his *Grundrisse* discussed the appropriation of the workers' knowledge as the absorption of this knowledge in the instruments of production in machinery. Thus the development of the means of labour into machinery is not an accidental moment of capital but rather the historical reshaping of the traditional inherited means of labour into a form adequate to capital. The accumulation of knowledge and of skill of the general productive forces of the social brain is thus absorbed into capital as opposed to labour and hence appears as an attribute of capital and more specifically of fixed capital insofar as it enters into the production process as means of production proper (op cit p 694)
- 11 See Harry Braverman op cit p 112-13
- 12 As Antonio Gramsci stated the point in *Americanism and Fordism* Taylor is in fact expressing with brutal cynicism the purpose of American Society - developing in the worker to the highest degree automatic and mechanical attitudes breaking up the old psycho-physical nexus of qualified professional work which demands a certain active participation of intelligence, fancy and initiative on the part of the worker and reducing productive operations exclusively to the mechanical physical aspect (op cit p 302)
- 13 See Harry Braverman *Labour and Monopoly Capital* op cit p 241
- 14 See Muto Ichio *Class Struggle and Technological Innovation in Japan since 1945* op cit p 35
- 15 Figures regarding the quantitative increase in the number of quality control circles are mentioned in Jacob Mankidy *Human Resource Management* op cit p M 57
- 16 Quoted from Muto Ichio op cit p 36. The Seminar paper of Transnational Information Exchange notes the fundamental contradiction of Toyotism that workers on the one hand are involved in thinking about production structures and processes but on the other hand are refused the right to true self-determination (op cit p 9)
- 17 Quoted from Antonio Gramsci *Americanism and Fordism* op cit p 310. In his essay Gramsci devotes a specific section to the theme of High Wages (pp 310-13)
- 18 The seminar paper of the Transnational Information Exchange notes that the introduction of Japanese management techniques is often accompanied by factory closures, the dismissal of trade union activists and reduction in wages. Examples discussed are those of New United Motor Manufacturing (NUMMI) a joint venture between General Motors and Toyota in Fremont California which became a model for other companies worldwide and the Ford Cuautitlan factory near Mexico city (op cit pp 3-4)
- 19 A major part of the second volume of Marx's *Capital* is devoted to the theme of the turnover time of capital (op cit p 156)
- 20 The point is noted amongst others by Benjamin Coriat in *The Workplace and the Stopwatch* op cit p 57
- 21 See Karl Marx *Capital* Volume I Chapter XIII on Co-operation op cit p 305
- 22 See the section *Passage of Modern Manufacture and Domestic Industry into Modern Mechanical Industry: The Hastening of This Revolution by the Application of the Factory Acts to Those Industries* *Capital* Volume I op cit, p 442
- 23 See my overview of the theoretical debate in the women's movement regarding women's labour *The Debate on Women's Labour: Historical and Theoretical Perspective* published in Bengali by Shilpa Sahitya Calcutta 1992
- 24 For a lively account of the intense pressure experienced by Japanese workers employed to work on the assembly line see the diary of the Toyota worker Satoshi Kamata *Japan on the Passing Line*. As the author notes the system of assembly line production is extended to the subcontracted firms and the system of kanban provides the connecting link. The assembly lines in the supplying firms are synchronised with the assembly lines in the Toyota factories. This kanban method which has been hailed in the media is actually intended to ensure the deliverance in time by the subcontracted firms. It forms a further proof of the increasing synchronisation in industry. Even the streets between the supplying firms and the Toyota factories are considered to be assembly lines which connect the actual assembly lines in the factories with each other (op cit p 142). This quote well illustrates the close interconnection between Fordist reduction of stocks and Toyotist reduction of stocks!
- 25 The history of Fordism indicates that the victory of Toyotism over the trade union movement may well be temporary. As the seminar paper of the Transnational Information Exchange states it took several decades for American unions to catch up with Fordism. Until the sit in strike at General Motors Flint car plant in 1937 (during which the United Automobile Workers Union was born) it was thought impossible to organise the deskilled and semi-skilled assembly line workers into a union (op cit p 4)

Ethics and the Indian Manager

R C Sekhar

Organisations caught up in the tough world of competitive survival have found it difficult to make their ethical missions congruent with the traditional systems of management controls. The IIMs in India do not have as yet compulsory courses in ethics. This article makes a case for ethics in business, not just as a rhetoric but as a socially useful basis for action.

THERE is an unmistakable surge the world over in the demand for managers who are trained in ethical thinking; business ethics cannot in the circumstances continue to remain a mere rhetoric for long. Stark (1993) estimates that there are 500 courses in the US, 25 textbooks and three academic journals all devoted to business ethics. Harvard starts pouncing its students on ethics right from the first semester. And if ethical philosophy of business had any innate tendency to get stuck to its rhetorical moorings, Stark shows how it could, and selectively has, learnt to become a very relevant and practical area of management education. But, he basically assesses the viability of an educational tool in the classroom and not its impact in the field. More recent reactions from the field indicate that there is still much to achieve. Organisations caught up in the tough world of competitive survival have found it difficult to make their ethical missions congruent with the traditional systems of management controls applicable to first line operational managers. The newly ethically educated MBAs, usually at the middle levels, are bravely trying to cope with and resolve the apparent conflict of priorities bobbing up all the time.

There have been stirrings in India also, not just in imitation but from equally deep anguish. The pioneer in this field is SK Chakraborty (1986, 1991, 1993, 1995) of the Indian Institute of Management, Calcutta. The IIMs however do not as yet have a compulsory course in ethics; it is taught only as an optional at IIM Calcutta. Two or three other premier institutions of management in India, and the TA Pai Institute of Management is one of them, have compulsory courses on ethics in business. Each one of them has its own framework for teaching. We are now at the brink of a public debate as to how to ensure that all this passion is just not rhetoric but socially useful basis for action. The good intentions behind all of these frameworks being accepted, they have nevertheless to be tested carefully and pragmatically.

The expression 'rhetoric' is used in the sense of a high-sounding declamation which is intended to impress but is of no use for practical action towards achieving its explicitly stated objectives. It could also mean that its unsaid objectives are at variance with its stated objectives and the declamation is really an attempt to divert the attention

of the listener. Here are typical examples of rhetoric in ethical declamations made to students of management or practising managers: 'There is only one way we can bring ethics to the world and that is by the overthrow of capitalism', or 'bringing in the raja-rishi concept in our lives discovered by ancient Vedic India', or 'cleansing the mind by Integral Yoga', or 'preserve the purity of teachings of the Quran', or 'apply the teachings of the Buddha, Gandhi or Christ to humanity', or 'ensure free markets so that profits motivate people', or 'make the minimum number of laws for ensuring uniform rules of the game in a free market and penalise sharply anyone breaking the laws', etc.

Every one of the above statements is frequently made by some or the other school of thought of ethical and economic philosophy. But on their own, they fail to give any practical meaning to a choice of managerial action. They have, however, usually provided a convenient alibi for the manager to act so as to be able to indulge in his/her own wants and desires. This is legitimised by saying that till the world changes to the creed declaimed, it is certain one can do nothing more than 'follow the crowd'. Stark (1993) shows that no sooner extensive teaching ethics to managers became a reality, those who were teaching them were confronted with the stark lack of relevance of such an approach to the real issues faced by managers in their work. Arun Monappa (1987) of IIM, Ahmedabad showed that much of religious preaching in the country by institutional religions was perceived as totally irrelevant by the business community and business managers. Eight years later, today, the situation in India has not changed; as shown from field studies reported later in the article.

Statements such as the above would not be a 'rhetoric' if made in some other circumstances by policy-makers, social reformers or activists. For example, when young revolutionaries threw themselves against the barricades and declared themselves for liberty, equality and fraternity or when Marx and Engels wrote the Communist Manifesto or Lenin went across in a sealed train to take charge of the Russian revolution, or when a Naxalite charges against the government, or when the Americans declared independence and followed it up by adopting a Bill of Rights,

or India evolved the Indian Constitution or when the Buddhist monks and Ashoka preached peace. These would have been directly relevant for action. But that is not the role we seek for the average manager.

Again, if now such preaching is done to gain votes for anyone or give the strident declaimers a perpetual prominence in public affairs trading on peoples' frustrations, it would be a detestable way of using 'rhetoric'. Having cleared some of the definitional issues by descriptive illustrations we would now proceed with the basic substance of the paper.

The nature of alternatives needing the working out of ethical trade-offs in business organisations are varied. (i) product choices, (ii) pricing policies, (iii) process choices, (iv) environmental issues, (v) employment practices, (vi) career advancement decisions, (vii) customer policies, (viii) purchase decisions, etc.

One may view these issues from the slightly differing perspectives of the ethical role of the decision maker. The roles one may assume are: firstly, harmonising oneself with the organisation, secondly, taking policy decisions as the final authority, thirdly, setting the organisations ethically right, or fourthly, setting social norms as leaders of society. There is undue emphasis on the second role with reducing importance to the third role and the fourth role in that order in the current western literature. Current Indian literature has on the other hand a greater emphasis on the fourth role. But the first aspect, namely, the need for harmonising is more ubiquitous for the managers. As Solomon (1994) mentions, "Policy disagreements are irrelevant... most employees do not make policy... moral dissensions with implied policies is the more appropriate concern of business ethics", i.e. the problem of most modern managers is not to lay down the 'dharma' but to cope with the tensions with the laid down dharma. But contrary to the situation of Arjuna of the *Gita*, the present-day manager has not only to take decisions in a dilemma but carry his team along.

Further, there are limits to ethical choice by the circumstances of one's birth. In strongly caricatured style William Fredrick (1986) describes the situation and criticises the approach of normative ethics:

Now enter the philosophic ethicist, speaking the sweet voice of reason and urging adoption of abstractly attractive ethical principles and

categories ethical analysis (has to deal with) the reality the observed fact of value conditioning within socio cultural context not with wishfulness the locus of ethical systems that drive individuals organisations and societies along certain pathways are according to certain culturally and genetically induced principles [quoted in Bowie 1986:58]

Fredrick revolt against an excessive reliance on ethics of ought with little consideration for what is shifts the focus from ethics as a finished product to an ethical discourse as an ongoing process

Thus a typical manager no doubt has several ethical choices which need education to select from But they are all hemmed in by the circumstances and the antecedent history of the organisation and society This contextual character of ethical processes of managers or any others is well appreciated by philosophers of vastly differing and even contrary inspirations Thus David Hume who is the father of modern scientific rationalism and *Bhagavad Gita* which invokes divine inspiration both recognise this

ETHICAL PLURALISM

If ethical training for a manager must have a close nexus with what is it becomes imperative that a very important part of ethical education must be an understanding of reality the economic institutions social institutions the norms of law and most of all the basic nature and extent of socialisation Are the people in this country fatalists or at the other extreme profit maximisers? Are they deeply imbued with respect for institutional religion and fundamentalism or do they have greater respect for symbols of emerging institutions in the country which have common feature of the international traditions of democracy and free choice? Do they believe in duties as the basis of ethics or rights? Are they lone wolves or have they cultivated a sense of bonhomie? Are they consumerists too ready to be corrupted by the global markets or are they guided by more basic values?

One may not be able to give a firm answer to any of these questions but one can broadly see if the dramatised versions of depravity and corruption religious mania and hatred which is rending the air today are truly representative of the people The criminalisation described in the Vohra Committee or the picture thrown up by the great Indian bank scam are no doubt aspects of Indian reality But how common is this depravity that an ethical manager would have to constantly and continuously battle with it all the time? Should this vision of India colour distort and damage their outlook of optimism and trust?

A quieter and less demonstrative method of objective field inquiry by the students

of the TA Pai management institute (see Appendix) shows that the reality may be much more hopeful and the future of ethical processes could well be much more in the great humanist tradition which unfolded itself with the French revolution the American revolution the Russian revolution and the Indian Constitution their aberrations notwithstanding Thus market systems of exchange of goods and services are considered more likely to offer systemic ethicality as was the hope of Tom Paine the great and fiery philosopher of individual liberty and liberalism [Paine 1792], but very significantly organised workers' thought otherwise The surprising evidence of bonhomie and compassion among the Indian people and their rugged ethical base was a learning experience for the students The disenchantment of the Indian people with institutional religions as ethical aids came out boldly Also is evident their greater faith in the symbols of modern outlook e.g. teachers were ranked far higher than religious leaders as role models Modern means of watching ethical accountability are valued e.g. activism law and journalism in that order Prayer and religious exhortation and formal religious beliefs are considered to be totally weak methods of society regulating its ethics Not praying is considered no sin at all but not caring for the aged a cardinal sin even more than taking bribes Professional background affect one's faith in ethics but never to damage it totally Indian MBAs are far more unwilling to sacrifice ethics for achievement than Indian engineers or US MBAs But unfortunately they are somewhat self righteous and feel that the others (i.e. other than themselves) are more easy in bending over backward in ethics to succeed in life In summary the ethical climate is one of ensuring a fair balance by assertion

and legitimisation of rights rather than a plea for duties, this has an exception when it typically comes to duty to the aged and women in which the appeal to duty is made There are five implications of this for ethical education of the managers

Firstly the universalised model of the economic man who only works for maximising his profits is a myth Though this assumption may be useful for broad economic analysis, it would fail as a cornerstone of social control Amitai Etzioni (1988) has also made this point in his writings Reality is closer to the more rounded understanding that man is a mixture of greed and bonhomie and the quality which predominates is a structural consequence Therefore structures are as important in ethical hope as the individual Bharthrihari also implies this in his writings Secondly there is an underlying appreciation of ethicality in the social psyche and unethical behaviour is likely to cause cognitive dissonance Any person who is boldly ethical is likely to get a positive response in the long run This feature was highlighted to the author by Amol Karnad the MD of Alacrity Foundation the well known company of ethical builders who demonstrated that ethics can also pay

Thirdly the mutual distrust in the Indian psyche could have important repercussions on the ethical processes of a manager In an interesting study Stephelo Galbraith and Grimm (1994) have shown that in the US the perceptions of unethicality of others trigger unethicality of the perceivers This would mean that a major step in ensuring that cynicism does not play havoc on the manager is a process of building trust in people Fourthly paternalism is not the ethical expectation of the day but respect for democratic choice is Therefore an ability

TABLE I DEONTOLOGICAL AND TELEOLOGICAL SCORES OF SAME PL POPULATION

Occupations	Deontological Scores	Teleological Scores	Average Age
Group I Realists			
1 Shopkeepers/bankers	2.23	2.95	36
2 Senior executives	2.44	2.06	46
3 Engineering students	1.88	1.87	21
Total Group I	2.24	2.80	37
Group II Pious Duty Bound			
4 Blue collar workers	2.81	2.31	40
5 Manual workers	2.89	3.00	34
Total Group II	2.85	2.68	37
Group III Accessive Moralists and Idealists			
6 Housewives	3.10	1.90	41
7 Medical students/doctors	3.38	2.61	26
8 Non professional college students	3.00	2.56	21
9 Delhi MBA students not yet initiated to ethics	5.00	1.00	22
Total Group III	4.63	1.66	26
Total all group	3.24	2.05	34
10 Perception of Delhi MBA students of others	0.00	4.00	

Notes: Differences within groups not statistically significant except in the case of the Delhi MBAs (item 9) Difference between groups on account of occupation unlike in age is statistically significant at 96 per cent confidence level

to understand and work for mutual self-fulfilment has to be a profound feature of ethical abilities. Fifthly, ethical expectations have multi-dimensional features and have subtle nuances which aggregation and oversimplification would fail to capture.

The fourth and fifth needs of ethical learning of the previous paragraph would clearly point to the compulsive requirement of a pluralist approach to ethics. Pluralism could be defined as a rejection of the destructive quest for some *summum bonum* and recognises that the legitimate ends of life are many and there are wide varieties of good and moral lives and that there need be no blueprint for heaven. It was typical of Indian philosophy that it developed a model somewhat like that in the realm of religion and philosophy.⁴ But very importantly, there is some, but very much less, evidence of pluralism in ethics, compared to religion and metaphysics. The ethical pluralism of India is not pluralism by choice but a relativistic plural ethic thrust upon persons.

Marxist analysts like Kosambi (1964:209, 114), have been unable to comprehend this autonomous growth of pluralism in philosophy. Their analytical frameworks worked on the assumption of a one-to-one correspondence between ethics on the one hand and metaphysics and religion on the other, between 'relationships of production' on the one hand and 'the superstructure' on the other. Perhaps we have only to look towards modern Indian authors, for some fresh air on ethical pluralism.

In more practical terms what would pursuit of pluralism mean? It could mean the extensive use of three concepts, minimalism, meliorism and public discourse.

Firstly, in applying the concept of minimalism we could use three typical operational instruments and one attitudinal back-drop. We would put the minimum number of don'ts of ethics in our criminal legislation. The choice of these is based roughly on an understanding of the 'stochastic probability' of socially undesirable action of the members, without the law and if there were a law. Waddington's (1967) concept of ethics of stochastic processes is described by Hardin (1988) in the overall context. These changes in 'probability' could guide the formulation of the law. We would put the minimum conditions to ensure fair rules of the game in our civil legislation. We would provide maximum flexibility in application in our procedural law, administrative law and case law.

Secondly, as an attitudinal back-drop we would cultivate a strong approach of meliorism in our educational systems. Meliorism can be defined as an aspect of pragmatic ethics [McDormitt 1986] owing much to the American philosopher, John

Dewey. Modest but deep pragmatic morality calls upon us to a life of 'meliorism', a life in which we effect no ultimate solutions, yet stress to make things a little better. The consequences of a 'total solution' may create still more problems. It hovers dangerously between ethical absolutism and ethical expediency. Indian meliorism took the shape of tolerance towards frailty or overwhelming importance of love in ethics (depending on the way one looks at it), typically embodied in the Krishna legends, this exasperated humourless Marxists like Kosambi [Kosambi 1964:115]. A very perceptive and sensitive understanding of this is available in a recent book of deep tentonic scholarship by Hardy (1995).

Thirdly, there is a need for transparent open discussions by a multiplicity of spontaneously formed publics [Habermas 1979, 1989, Craig 1993]. Habermas, a neo-Marxist, sees this desirable condition of democratic discourse, existing nowhere in the world, in capitalist or in socialist countries, the west or the east. But that is no reason we should revert to an elitism in ethical dispensation which is implicit in some of the variants of "back to the Hindu roots" [Chakroborthy 1995]. Pluralism does not necessarily mean a

cynical and pessimistic acceptance of a dismal status quo.

We could close this discussion on pluralism by referring to its tendency to gravitate towards a minimalist ethics of don'ts and leave the do's to individual decision. Chakroborthy, however, argues forcefully that this turning back from paternalism, however controlled and well intentioned it may be, could be extremely psychologically destructive. It could also overdo the ethics of rights and neglect the ethics of duties. [Chakroborthy 1986:199]. This, he says, is extremely harmful to society. Needless to say that a maturity of understanding could guide one towards a 'middle path'.

'MIDDLE PATH' OF ETHICS

Moral philosophers of the free market economy would say that the cheapest way of 'doing the greatest good to the greatest number' is allowing individuals to define what is good for themselves. The magic formula of 'market prices' would determine how people would value each other's goods and services and make it the basis of exchange. This would enable the society as a whole to move towards optimal allocation of resources and ensure maximum efficiency of operations. It could even allow the

TABLE 2 BELIEFS REGARDING HUMAN BEINGS AMONG SAMPLE POPULATION

Statement	Score (1 to 3)	Significant Patterns
1. Human beings are selfish and need compulsion to be ethical	2.00	Significant diff. between occupations (93 per cent Confidence). Shopkeepers/ engineers agree. Housewives, doctors disagree. Correlates with deontological scores in Table 1.
2. Human beings are victims of socio-pol pressures forcing unethical behaviour	2.00	Significant difference between occupations (99 per cent Confidence). Correlates with deontological score in Table 1.
3. Religious leaders can settle (a) domestic problems (b) ethical business problems	2.36 (a) 2.30 (b)	Differences between occupations and ages and (a) and (b) parts statistically insignificant.

Note: Scores 1: totally agree, 3: totally disagree and 2: intermediate position.

TABLE 3 ETHICAL ROLE MODEL FOR SAMPLE POPULATION

Role Model	Score	Rank	Significant Patterns
Group I Highly Regarded			
Teachers	1.89	1	Very high for housewives and shopkeepers very poor for engineering students and manual workers. Statistically significant.
Doctors	2.33	2	Uniform over occupation and age.
Group II Medium Regard			
Priests	2.94	3	Very poorly regarded by housewives and manual workers. Other differences insignificant.
Group III Poorly Regarded			
Businessman	4.05	4	Uniformly poor including shopkeepers themselves.
Government servant	4.30	5	Ditto.
Politician	5.47	6	Ditto except blue collar workers' significantly high regard.

Note: Differences within groups are significant at 90 per cent to 99 per cent. Differences between groups significant at 100 per cent level.

indulgence of very varied perceptions of individuals of the nature of man, but leave it entirely to their private worlds. A person's contacts with others are for the limited purpose of exchange of goods and services. Thus, according to them, operating on free market systems and prices is the most ethical thing one can conceive if pluralism is the key word. Nobody loses in this and everybody gains. It is all so simple, cheap and awesomely complete.

It is quite understandable why this way of looking at things captured the imagination of economic thinkers with the breakdown of the shackles of feudalism in 19th century Europe (Adam Smith, Marshall and so on). But contrary to the views usually held, Sen (1987) shows that the fathers of this line of thinking were not naive to believe that the whole of ethics could be captured by this rapturous scheme of things. It is only the current crop of Chicago school economists in the US who believe that this is not only what 'is' but also what 'ought' to be with as little modification as possible [Freidman 1970; Becker 1976]. Thus current-day market economists far from being indifferent to ethics think that the highest ethics is this concept of market mechanism and the drive for the resulting profits. But even they would seek one support. They are 'minimalists' as described in the previous paragraph. Make the laws strict and penalties for breaking it severe and see the magic results everywhere including environmental ethics, they would say. It also presumes that while making the laws human beings would be benign collectively just to ensure they can indulge in being wicked and greedy individually. They expect human beings to be ethical chameleons changing colours.

We have indicated in the previous paragraph why many, and particularly sociologists, would not agree with the model of economic man; we also supported them with field data. We would now more forcefully assert that Freidman's exclusive dependence on market systems for ethical dispensation of pluralism with the support of law is neither 'is' nor 'ought to be'. It has been shown [Sekhar 1995] that the practical way civilisations have sustained pluralism in any form is through several integrative mechanisms and institutions in addition to market systems and law. They include psychological socialising processes [Kohlbergh 1981 quoted in Laurence 1993; Ghose 1986], professional groups, organisational structures, mythology, epics and religion, literature and arts. These keep humanity in the 'middle path' which was referred to in the previous paragraph. Hirschman (1982) in a masterly analysis of the twists and turns in the ethical philosophies of market systems over the last three centuries has shown that it has varied from a total

belief in its ability to provide civilised choice to total horror at its potential to destroy decency and liberalism. He has also shown how both the assertions could be true for some situations and in some societies. Today we may be witnessing a possibility of a dialectical synthesis of several features of market and non-market civilising institutions. To extend the plea at the end of his brilliant paper, "is it not time for ethics to embrace complexity", and adopt a synthesis of the methods of both the precision of economics and the breadth of sociology without depending solely on either of them? [Baron and Hannon 1994]

Those who have sought a totally self-contained holistic logic in ethical prescriptions have tried in vain. Usually, their frustration comes from their inability to get a consensus right at the starting point of their trip. A holistic view in its absolute sense, should start from ontology which lays down the essence of things, move on to philosophy, then to moral philosophy then to meta-ethics, then to ethical norms and last of all apply ethics to specific issues. But most interestingly Hare (1986) has very insightfully shown that if we start the trip from the other end the problems are usually much less in practice. In nine times out of 10 one can arrive at a consensus as to what should be done provided the facts and the consequences of alternative actions are well understood and the attitudinal preferences of every one is made explicit and transparent. This is almost a commonsensical stand which is also that of the modern philosopher Stevenson (1947-48) and Brihaspathi of the Lokayata schools of ancient India. Therefore an attitude of mind which attempts to make

this explicit is good ethical education. This is no different from the methods of Nash's (1989) 12 ethical questions or Hunt and Vittel's reiterative heuristic model (1993). Sekhar (1995) has felt that this pragmatic approach of applied ethics would undoubtedly be helped if one also adopted the concept of 'nishkamya karma' (work with indifference to personal rewards) from the *Gita*, even if we disagree on some of its other features.

There is incontrovertible evidence to show that psychological processes for socialising individuals in society is one of the fundamental features of ethics. Indian traditions are rich in technique in these processes. They can be ignored only at our peril. It would be very important to separate these techniques from those which flow directly from the undemocratic, unequalitarian and exploitative features of the Indian past.

The evolving trend of Indian thinking starts from the sankhya philosophy 2,000 years old, through Patanjali, the *Bhagavad Gita* (both about fifth century BC or a little later), Rajashekara (9th century AD), skirting the Zen-Yoga, the 20th century writings of Aurobindo, the widespread practices of transcendental meditation developed by Maharishi Mahesh Yogi and the most recent efforts of 'mind stilling exercises' and 'chithashudhi' of Chakroborty (1993). There are several other variants in the recent practices which attempt to develop the basic ideas of the Indian psychological tradition.

India has a wealth of didactic material and rich repertoire of myths, legends, epics and religious lore. The contribution of the *Bhagavad Gita* to adaptive thinking is enormous for the very reason that is explained

TABLE 4 PERCEPTION OF SAMPLE OF RELATIVE SERIOUSNESS OF ETHICAL LAPSES

Ethical Seriousness Lapse	Score 1-10	Rank	Significant Pattern
<i>Group I Extremely Serious</i>			
Beating wife	3.77	1	Significant (99 per cent) difference with occupation and age. Less than 40 are more concerned and so are manual workers.
Not caring for the aged	3.79	2	Engineering students are more concerned.
Sex outside marriage	3.99	3	Significantly higher concern in age 30 to 40 irrespective of occupation 94 per cent confidence level.
<i>Group II Very Serious</i>			
Taking bribes	4.69	4	Sr executives more concerned.
Cheating	4.75	5	Ditto
<i>Group III Serious</i>			
Giving below minimum wages	5.22	6	Students consider it very serious but blue collar workers are worried but little 94 per cent Confidence Manual workers are more concerned than blue collar workers.
<i>Group IV Moderately Serious</i>			
Giving bribes	6.09	7	Uniform across occupation and age.
<i>Group V Not Serious</i>			
Not praying	7.15	8	Ditto
Not doing special work for	7.33	9	Ditto
Not giving charity	7.56	10	Ditto

Note: Only differences between groups statistically significant (100 per cent).

in note 1; it recognises the contextual constraints. The instant popularity abroad of even the quixotic and eccentric Indian bhakti movements, like the Hare Krishna one, is proof of its potentials. There is a need for the Indian identity to assert itself when the ethical climate of India is being disparaged by western scholars for being largely devoid of free markets, lax legal enforcement and corruption [Bowie 1993; Donaldson 1993 in White 1993].

Ashish Nandy (1983), pleading for a revival of the Indian identity, says that in the Indian context knowledge without ethics is not so much bad ethics but inferior knowledge. It would be equally true that ethics without knowledge would be inferior ethics. But as could be surmised from the discussion so far, the knowledge is not only confined to cognitive analysis but also experiential knowledge which can be understood by the heart. But neither knowledge nor ethics is of practical use unless managers learn to innovate all the time to create feasible ethical paths to economic achievement. Neither ethical permissiveness nor self-righteousness is the need of the hour. This has five implications for ethical education.

Firstly, ethical education cannot avoid complexity and convert itself to 'formulae', no less than the general run of management education. Secondly, ethicality has all the time to think of alternative paths to achieve. Thirdly, ethical education cannot be delinked from ambiguous and contentious subjects like psychology, philosophy and religion, but even this would be incomplete without seeing the links with systemic ethical processes better understood from law, sociology, organisational behaviour and economics. Fourthly, the case approach to ethical education would be very appropriate. Fifthly, the ancient tradition of stories and anecdotes could communicate the ethical feel very effectively and could be used in varied forms. This also follows from an extremely interesting analysis of the differences between this method and others by King and Acklin (1994).

Ethics is no longer a 'rhetoric'. Ethical education can be and are designed to produce balanced pleasant flexible and effective managers with the power of insights and courage to create and use ethically desirable means to sustain organisations in an ambience of liberalism and democratic choice. They must learn to see people as they are: mostly good but sometimes vicious. The education must consciously try to prevent the managers growing chips on their shoulder on the virtues of a dog-eat-dog ethics or get into a frenzy of fanatical self-righteousness of a fundamentalist who has a maniacal desire to 'reform the world'. Ethics is not a product but a process, which is often complex and

requiring synthesis of several disciplines. Most of all it can never be a formula. Ancient Indian psychology has profoundly useful instruments but these alone would not suffice unless used contextually. Teaching of ethics is ideally based on the case method and supplemented by the ancient methods of story-telling.

Appendix

A FIELD STUDY ON ETHICAL ATTITUDES OF INDIAN POPULATIONS

The study (conducted by the students of the TA Pai Management Institute) had a five-part questionnaire.

In the first part, the respondents were asked to indicate their advice in four situations. All of them were in the setting of a business establishment in which the advice had to be given to the owner. In the first situation an employee tells lies but because of that brings in profits. In the second he tells lies but this results in losses. In the third situation the employee tells the truth and makes profit. In the fourth situation the employee tells the truth and makes losses. The owner had five options: Sack him, Counsel him, Do Nothing, Encourage him or Promote him. Scored as 1 to 5 they would obviously measure the extent of approval of the behaviour of the employee. Let us assume the scores are X, Y, A and B. The sum of difference in approval between truth and lie in both situations of profit and loss $(B - Y) + (A - X)$ would indicate the 'absolute moral tendencies'. This is labelled as the 'deontological score'. The word deontological is used to mean a tendency to hold that certain things are right and certain others wrong by themselves, irrespective of their consequences.

The sum of differences between the scores of profit and loss situation in both cases put together $(X - Y) + (A - B)$ would measure the tendency for bending over backward for achievement, ignoring moral

principles. This could be labelled the 'teleological score'. The word 'teleological' is used to describe a tendency to believe that an action is right or wrong as judged by its consequences. Good is defined independently from the right and the right is defined as that which maximises the good. In the formula used above profit is treated as 'good'. The clarity in distinguishing deontological approaches from teleological approaches is adopted from Rawls (1971). The concept of scoring was adapted from Hunt and Vasques-Paraga (1993).

The second part was a set of strong statements on the nature of human beings and the strength of their agreement and disagreement. The third part was to check on the professions which the people look up to as role models for ethical behaviour. The fourth part was the relative ranking in the heinousness of a set of ethical lapses which were fairly common in present day in India, whereas normative ethical doctrine forbade them severely. The fifth part ranks the alternative methods of curing corruption.

The analysis of the result is shown in Tables 1, 2, 3, 4 and 5. Table 1 shows that on the overall, the population is fairly high deontologically (score 3.24 in a five point scale) whereas the teleological score is only 2.05, i.e., they are more deontological than teleological. The occupational pressures drive some more towards teleological tendencies; age has very little to do with this shift. The population is partitioned into three groups: Realists, Pious Duty Bounds and Aggressive Moralists and Idealists (Groups I, II and III, Table 1).

The MBAs were tested before their initiation to ethical education. Very interestingly they have much greater deontological tendencies than engineers, whereas the opposite trend has been reported for US populations by O'Leck and Oklsen (1993). But the MBAs have a very poor opinion of the ethicality of 'others'. (see item 10, Table 1)

TABLE 5: PERCEPTION OF SAMPLE POPULATION ON CURE FOR CORRUPTION

Solution	Score 1-7	Rank	Significant Pattern
I Most Effective Cluster			
Activism	3.29	1	Housewives strongly for, executives strongly against 92 per cent confidence
Improving law	3.50	2	No significant differences (occupation/age).
Journalism	3.67	3	Students rate it best. Other differences not significant
Deregulation	3.71	4	Workers dead against housewives for. Difference strongly significant 99.5 per cent
II Moderately Effective Cluster			
Selfregulation movements	3.84	5	Shopkeepers least impressed Other differences not significant.
III Least Effective Cluster			
Education	4.46	6	Uniform
God-fearing	5.14	7	Ditto

Note: Difference between groups significant 100 per cent. SI nos 1 and 4 in Group I statistically different significantly at 90 per cent level.

Tables 2 and 3 clearly demonstrate that deontological values have little to do with religious leaders (item 3 Table 2 and item 3 Table 3). Possibly they owe much to the long humanist tradition in India embodied in the epics and folklore in aryan dravidian and dalit traditions and the poets who have protested against organised religion and have ridiculed the go between with god Kabir was their fountainhead. Those with lower moral values tend to throw the blame for their poor ethics on society (remarks against items 1 and 2 Table 2). The utter contempt of the people for government servants, businessmen and politicians (items 5 and 6) shows up in Table 3. This is obviously a result of the irritation against corruption. The answers to the next two parts of inquiry would take this up further. The comparative coldness towards priests and warm and high regard for teachers and the doctors shows the strong faith people have in the modern symbols of knowledge and free thinking.

Corruption (items 4 and 7 of Table 4) along with cheating (item 5) is seen as worse than ignoring religion. Corruption is interestingly condoned more easily for the giver than the taker, the taker is the hated government servant and the politician.

But the more personal values (items 1, 2 and 3) of not caring for the aged, sex outside marriage and ill treating wife are considered very much more serious than corruption. Apparently the blame for corruption is more easily shifted to society. It is very interesting to speculate on the significantly greater concern for conjugal ethics in the age group 30 to 40 as contrasted to the younger and older age groups. The young seem to be going in for sexual freedom while the older have less values of chivalry. This is a carry forward of the traditional cultures. Corruption is seen as remediable in Table 5 using better controls through market systems, law activism and a free press rather than just through moral rhetoric. The strong implications this has for institutionalising ethics through public controls implied in systems of free market and free speech are significant. It approaches US normative ideals. (We are not discussing the actual US situation.) It is also extremely significant that both clerical and manual workers are dead against deregulation as a means to improve ethics, whereas all others see it as very useful.

Notes

- 1 Bhagavad Gita sloka 41 of chapter 18. Slokas 47 and 48 of chapter 18 enunciate the well known principle that every person should follow the dharma of his caste and not seek the dharma of another caste, whether they be brahmin, kshatriya, vaisya and sudra. One need not be overzealous, bend over backward, twist the words and plague our credibility and say that these do not support a caste system. It is more natural and realistic to interpret the verses as an understanding that the individual

- goals and ethical choices are strongly conditioned by the situation one is born to.
- 2 Bhartishari in his *Nitisataka* (verse 64) has classified humanity into different types. Swami Rangathananda (1968) interprets this verse to show the function of the state and administration is to so devise their systems as to guide the frail to go along the ethical path.
- 3 Amol Kamad the MD of Alacrity Foundations, an outstanding example of an explicitly ethical company, told the author: 'When we meet officials, our reputations precede us. Something makes them too shy to press for a bribe. There is some phenomenon of osmosis takes place and more often than not we find our going surprisingly smooth.'
- 4 Bhagavad Gita chapter 4 sloka 11, chapter 7 sloka 21 accepts faith in any form as legitimate. Yoga Vasistha Ramayana says:

A devotee of reason should value the words of ordinary persons provided they are rational and of advance knowledge and should discard those of even the sages if they are not such. A reasonable statement of even a child should be accepted. All various views arising at different times and at different countries, however, lead to the same supreme truth like the many different paths leading travellers from different directions to the same city. The method which makes a man progress is the best for him. [Arthreya 1953]

Indian Economy under 'Structural Adjustment'

Prabhat Patnaik
C P Chandrasekhar

What comes through clearly from the Indian experience with structural adjustment is the dominant role of the process of globalisation of finance. Indeed the very design of the current package of structural adjustment bears the imprint of this process and the sequel to the introduction of the package shows that the real mobility witnessed is that of finance rather than that of capital-in-production.

But if globalisation of finance restricts the possibility of intervention within a 'national' (or for that matter, any supra-national but restricted) space by undermining the concept of a 'control area', the question naturally arises: can there be any sort of an alternative to the current set of policies? It is the author's contention that a feasible alternative, not just a desirable one, to the existing policies exists.

POST-INDEPENDENCE India was one of the classic cases of *dirigiste* economic development. Not only was the state highly interventionist, but the economy came to acquire a sizeable public sector, especially in areas of infrastructure and basic industries. The 'mixed' economy which thus came into being, together with the fact that the polity was characterised by multi-party parliamentary democracy with a largely free press and significant freedom of expression, invested the Indian experiment with a novelty and uniqueness, which attracted worldwide attention and gave rise to a vast theoretical literature. Not only did a rich literature on development planning take shape within India, starting with the celebrated plan models of P C Mahalanobis who was a pioneer theoretician of Indian planning, but the class-nature of the Indian state, the class-character of Indian planning, etc. became matters of intense debate, especially in Marxist and radical circles, both within the country as well as internationally.¹

India's transition in 1991 to a regime of 'structural adjustment' therefore is an event of great historical significance, which merits serious study but which is shrouded in a great deal of misconception, some of it nurtured for ideological reasons precisely because of the significance of the event itself. The first such misconception is that 'structural adjustment' became inevitable because the earlier regime had brought the economy to a point of 'collapse'. Let us examine this proposition at some length.

I

Immediate Background to Structural Adjustment

The fact that the economy, prior to approaching the IMF for credit under a range of facilities,² faced an acute crisis in terms of very high rates of inflation and sharply declining foreign exchange reserves is not in question. But, first, this crisis was almost entirely speculative in origin, having little to do with the developments

in the *real* sectors of the economy; secondly, it cannot even be contended that the genesis of speculation, even if unrelated to the *immediate* performance of the real economy, could be located in some *long-term* tendency towards stagnation or collapse of the economy; on the contrary, the second quinquennium of the 1980s saw the most pronounced industrial boom ever witnessed in the history of the Indian economy, and thirdly, the vulnerability of the economy to speculative forces was itself in part a result of its gradual 'liberalisation' and the confusion about the future of *dirigisme* which came to prevail during this quinquennium.

To say all this is not to whitewash the fundamental flaws of the *dirigiste* regime, or to gloss over its basic contradictions, but merely to avoid making facile judgments about it. The nature of these basic contradictions, we argue below, was altogether different from what the ideologues of structural adjustment would have us believe. In the current section, however, we confine ourselves to showing the essentially speculative nature of the crisis immediately preceding structural adjustment; the longer-term issues are dealt with in subsequent sections.

Table 1 provides a summary picture of economic performance in 1990-91 and 1989-90. In terms of the performance of the material production sectors, at any rate, one can scarcely look upon 1990-91 as being in any sense a disappointing year. What did happen, however, is a sharp acceleration in the inflation rate, especially that affecting agricultural labourers who are among the poorest in the society, *notwithstanding substantial increases in agricultural output in general, and in foodgrains output in particular*. What also happened was a worsening of the trade balance largely because of a higher oil import bill and reduced exports to West Asia, consequent to the Gulf war. The increase in the current account deficit was even larger than the increase in the trade deficit. Not only had remittances

by Indian emigre workers from the Gulf countries, which had been an important source of foreign exchange, reached a plateau for a couple of years, but in 1990-91 there was an absolute drop in their size because of reverse migration. Whatever possible economic benefits the country could have derived from this reverse migration were not exploited when owing to the uncertainty over the fate of the Kuwaiti currency many Indians wished to shift their accumulated savings into Indian banks, the latter refused to accept them because they themselves were uncertain about the fate of the Kuwaiti currency. As a result anywhere between \$ 5-7 billion were reportedly lost to the western banks, which had no such hesitations about accepting the Kuwaiti currency; if this money had come into the country then the foreign exchange crunch would have been easily averted.

But the increase in the current account deficit, significant though it was, was not in itself primarily responsible for the foreign exchange crunch. The current account deficit stood at \$ 4,853 million in 1987-88, \$ 7,996 million in 1988-89, \$ 6,837 million in 1989-90, and \$ 9,438 million in 1990-91, which gives some idea of the order of increase involved. But this increase by \$ 2.6 billion in 1990-91 over the previous year, was more than offset by loans *without conditionality* from the IMI³ totalling \$ 2.5 billion and an *additional* running down of reserves, over and above the decline recorded in the previous year, of about \$ 250 million. And yet, the magnitude of reserves at the end of March 1991 was still large enough to cover almost three months' imports. Since three months' import-cover is generally considered to be 'safe' enough in the Indian context, the shortfall in reserves in March 1991, when severe import compression measures through quantitative restrictions were imposed on the economy, was by no means excessive. It was definitely less than a billion dollars, which is the estimated magnitude of illegally non-repatriated exchange earnings during the last two quarters of 1990-91 – a figure

that more than doubled by the time structural adjustment came into force

In other words, by March 1991 when import restrictions were imposed (which soon converted the trade deficit into a surplus) it was not the trade or current account deficit as such which was responsible for the foreign exchange crunch, but the speculative outflow of funds partly in the form of non repatriation of exchange earnings in violation of the country's laws, and partly in the form of non resident Indians taking money out of the country which was not illegal but constituted speculation nevertheless. After March 1991 as import compression began to reduce the trade deficit affecting the performance of the real sectors of the economy the balance of payments continued to be under severe pressure because the speculative outflows persisted and even got enlarged

One can argue quite persuasively that, *even so* India could have managed her payments and restored confidence in her currency with a relatively low *conditionality* IMF loan without going in for the whole gamut of structural adjustment measures. The reason that she did go in for structural adjustment was not because of any objective necessity being faced by the economy but because the liberalisation lobby consisting of both the Fund and the Bank as well as elements within the Indian government and business class (more on these groups later) considered this a heaven sent opportunity to tie the country down to structural adjustment, to jettison altogether and not just rectify, the *dirigiste* regime which had prevailed since independence. In other words the event of historical significance that we referred to at the beginning of this essay was achieved as a silent *coup* behind everybody's back as it were by trapping the country into structural adjustment. (It is interesting that the government never brought out a white paper on the balance of payments crisis as demanded by several opposition parties at the time.) We shall however be content in this paper to develop not this strong proposition but a much weaker one namely that the balance of payments crisis such as it was, was a contribution of speculative forces and did not represent a 'collapse of the economy under the earlier regime'. We have seen that there was no collapse in any *immediate sense*. Later on we shall discuss the more long-term performance of the earlier regime

The other aspect of the 1990-91 crisis relates to inflation, and this again represented not a failure on the production side, but a combination of speculation and of administered price increases in preparation for 'liberalising' the economy. The most significant feature of the inflationary process, we have seen, was the rapid increase in the

prices of the absolutely essential commodities consumed by the poorest in the society. Three commodities in particular led the inflationary process: rice, wheat, and edible oils with price increases over 1990-91 (last week to last week) of 14 per cent, 49 per cent and 33 per cent, respectively. Per capita availability (without taking account of private stock movements) of edible oils in 1990-91 was 5.5 kg which was higher than in the two preceding years: the cause of the price increase therefore was private hoarding. On such occasions the usual practice of the government had been to use imports (and release them if necessary through the public distribution system) for breaking the 'bullish' sentiment of the market, but the foreign exchange crunch, itself a fall-out of speculative forces prevented it from using this its standard weapon of supply management.

As for rice and wheat, again it was not any output or availability failure which underlay the price increase, nor was there any spontaneous speculative upsurge (since the 1990-91 output was remarkably good). The cause of the inflation lay in the government's decision to raise the issue prices of these grains through the public distribution system. In May 1990 the issue price of wheat was raised by 15 per cent while that of the common variety of rice was raised by 18 per cent. The reason for doing so was supposedly to control inflation by reducing the fiscal deficit through cuts in food subsidy: this idea which is an important component of structural adjustment had already crept into the thinking of the Indian government for quite some time under the influence of the World Bank. As a matter of fact it ended up sharply accentuating the inflationary pressures upon the poor.

A point needs to be clarified here: first agricultural labourers apart from a few states like Kerala, West Bengal, and of late a couple of other southern states, do not generally have access to the public distribution system: a fact which has been used by the liberalisation lobby to demand a whittling down of food subsidies on the ground that it would not affect the really poor anyway. What this argument misses however is the fact that the open-market price *invariably* moves up with the issue price of the public distribution system. A rise in the issue price creates self-fulfilling 'bullish' expectations among the sellers in the open market and given the inelastic demand for foodgrains this brings in a large bonanza even with small accretions to private stocks (which again can be unloaded in the next period at the government's fixed procurement price). This is exactly what happened in 1990-91 and would happen, as we shall see, with a vengeance the next year when structural adjustment was officially

enthroned as the basis of government policy. To be sure, the exact magnitude of open market price increase for a particular crop for a particular period may not match the magnitude of issue price increase owing to the existence of lags and of other specific considerations, but that does not negate the basic relationship.

If we have discussed developments in 1990-91 at some length, this is only to dispel the facile notion that the Indian economy was collapsing under the weight of *dirigisme*. There were plenty of things wrong with the Indian *dirigiste* regime, but before we come to them a discussion of the role of the Fund and the Bank in pushing the economy towards structural adjustment would be in order.

II

Role of IMF and World Bank

Among radical economists there is a tendency to lump the Fund and the Bank together as entities indistinguishable from one another, and to think of them as having remained more or less immutable over time. Nothing however could be further from the truth. There were significant differences between the Fund and the Bank which have *narrowed over time*, and the reasons for this narrowing constitute an important element of contemporary political economy. And each of these institutions has changed in crucial ways through time.

The Bank of course has always been opposed to any attempts on the part of the

TABLE 1 ANNUAL PERCENTAGE CHANGE IN
SELECTED INDICATORS 1990-91
(Figures in brackets refer to change in
1989-90 over 1988-89)

(i)	GDP at factor cost (1980-81 prices)	4.9 (6.9)
(ii)	Index of agricultural production	3.0 (1.6)
(iii)	Foodgrain production (in tonnes)	3.2 (0.6)
(iv)	Index of industrial production	8.3 (8.6)
(v)	Index of wholesale prices (1980-81 = 100)	12.1 (9.1)
(vi)	Consumer price index for industrial workers (base 1982 = 100)	13.6 (8.6)
(vii)	Consumer price index for agricultural labourers (1960-61 = 100)	16.6 (0.1)
(viii)	Exports (US\$)	9.2 (18.9)
(ix)	Imports (US\$)	13.5 (8.8)

Notes: Figures relate to financial years April-March. The increase in the wholesale price index is calculated by comparing the last week of the April-March year with the last week of the previous corresponding year; the increases in the other price-indices are obtained by comparing the last months.

third world countries to break away through conscious design (which necessarily means conscious state intervention) from the pattern of international division of labour inherited from the days of colonialism and semi-colonialism. If such a break is to be achieved then it must be achieved, according to its perception, entirely through the mediation of the market forces, which means in particular through the predilections of direct foreign investment. The Bank has remained absolutely faithful to this position of opposing state-intervention-sponsored industrialisation, despite the fact that historical evidence marshalled earlier by Gerschenkron and subsequently by many others shows overwhelmingly that successful industrialisation by late-industrialisers has invariably depended upon active state intervention. What has changed in the case of the Bank over time is first the specific argument on the basis of which it has expressed its opposition to state sponsored industrialisation; secondly, the precise tactics it has brought to bear in order to undermine state-sponsored industrialisation in third world countries; and thirdly the precise package of programmes around this basic objective reflecting as we shall see the changing nature of world capitalism.

The arguments which of course were not mutually exclusive though different ones received emphasis at different points of time kept altering in the following manner: in the late 1950s and the early 1960s there was a macro-argument that substantial unutilised capacity in the industrial sector existed because of a scarcity of foreign exchange so that a combination of import liberalisation and exchange rate devaluation would set up a virtuous circle of more imports – more capacity utilisation – more exports – still more imports – and so on – which would unshackle the economy from the clutches of *dirigisme* (which was predicated *inter alia* upon a recognition of demand constraints both in the external and in the internal markets). This was the argument on the basis of which the World Bank pushed the Indian government into adopting an import liberalisation-cum-devaluation package in 1966 with disastrous consequences.¹

In the MacNamara years the emphasis shifted to poverty. But the concern for poverty did not express itself in terms of any argument in favour of an egalitarian alteration in asset or land distribution; it expressed itself in the argument that the domestic inter-sectoral terms of trade were more unfavourable for agriculture *vis-a-vis* industry than the terms of trade prevailing in the world market, so that removing trade restrictions and thereby preventing state-sponsored industrialisation would benefit the agricultural sector which is the repository of mass poverty. This argument was backed

up by another one, namely since the inequality in urban income distribution was larger than that in rural income distribution a shift in income distribution from the urban to the rural sector, which means in effect from industry to agriculture, would have the effect of lowering overall income inequalities.² This argument amounted yet again to an attack on state-sponsored industrialisation: the vacuousness of this argument lay *inter alia* in the fact that nearly 60 per cent of the *agriculture dependent* population in a country like India being net buyers of foodgrains in the market and belonging to the poorest segment of society would be actually harmed by a rise in food prices in terms of their wage-unit.³

More recently the Bank has shifted to the well known micro theoretic 'marketist' argument which focuses on the allegedly interrelated phenomena of inward orientation, price-distortion and inefficiency. Much has been written on the vacuousness of this critique: 'outward orientation' as manifested for example in successful export performance has been accompanied by highly state interventionist neo mercantilist policies rather than any attempt to 'get prices right' in the conventional sense; the alleged 'inefficiency of *dirigiste* industrialisation is established through dubious statistical exercises involving dubious concepts such as 'total factor productivity (which is predicated upon the perennial absence of any demand constraint); there is complete silence on the role of the domestic investment effort in explaining growth performance, notwithstanding the overwhelming evidence which exists on its importance; and so on.⁴ We shall not dilate on this critique here; the point to note is that the policy-package following from this critique is exactly the same as before, namely to roll back state-sponsored industrialisation.

Where the Bank did change was in two respects: the first relates to its tactics. In the beginning up until the end of the 1950s in the case of India, the Bank studiously avoided giving any loans for government programmes. In the early 1960s it modified its stance to give loans for social infrastructure projects, but not for any public sector industrial undertakings. It is only when the policy of boycott of public sector undertakings appeared to be counterproductive from its point of view that it started financing investment in such undertakings but with its own conditionalities, such as global tendering, specifying technological details and the scale of plants, etc. This shift from 'boycotting' to 'infiltrating' the public sector enabled it to exercise great leverage, to induct multinational corporations (MNCs) directly into the public sector as collaborators, to

undermine domestic technological self-reliance and indigenous technological capabilities to dictate pricing policies and acquire an indirect say on the government budget and to set up networks with bureaucrats and managerial personnel of the public sector. Together with this began the process of World Bank employees shifting to key government positions especially in the ministry of finance even as they were drawing pensions from the Bank or even as they kept open the option of moving back to the Bank. They provided a powerful lobby working in concert towards liberalisation cum structural adjustment (arguably as mentioned earlier pushing the country into a trap where these policies became inevitable).

The other respect in which the Bank did change was in its new insistence upon a range of financial sector reforms whose overall objective again was to detach the domestic financial institutions and the financial markets from their integration into the domestic development effort (through, for example, low long term interest rates, subsidised credit and minimum percentage credit disbursements for priority sectors) such as agriculture etc) and to integrate them more closely instead with global financial markets. Together with this went the Bank's demand for privatisation not only of the financial domain where the public institutions held sway but of public sector assets including of natural resources. The economic as opposed to the ideological,

TABLE 2. GROWTH RATES OF INDEX OF INDUSTRIAL PRODUCTION MANUFACTURING
(Annual average compound rates, per cent)

1951-52 to 1964-65	7.8
1965-66 to 1969-70	3.3
1970-71 to 1980-81	4.1
1980-81 to 1984-85	5.7
1984-85 to 1989-90	8.8
1990-91 to 1994-95	3.9

Notes and Sources: The figures up to 1970 have 1960 as base; the figures for the 1970s have 1970 as base; and the figures for the 1980s have 1980-81 as base. These figures are taken from various issues of annual *Economic Survey* issued by the Ministry of Finance and *Report on Currency and Finance* of the Reserve Bank of India.

argument for privatisation was again utterly dubious as a means of closing the fiscal deficit it was no different from money created directly for the government's use as a means of reducing the government's interest burden it could work only under the palpably impossible condition that the rate of return sacrificed on the sold government assets was lower than the interest rate on public debt (which is impossible because the market would never buy assets at such low rates of return and in practice of course has insisted on obtaining public assets only at virtually throw away prices) and as a means of introducing entrepreneurship it was of no use because the buyers were either fly by night operators or if reputable MNCs had more complex objectives (on which more later)

This widening of the Bank's package from simply rolling back state sponsored industrialisation through a removal of trade restrictions, government controls and the pre eminence of the public sector to an integration of the domestic economy to the operations of global finance reflected a fundamental change that was taking place within world capitalism itself namely a tendency towards greatly increased fluidity of finance across national boundaries a tendency in short towards a globalisation of *finance* which is very different from, though often confused with globalisation of *production facilities*

This very tendency also explains the shift which was taking place in the position of the IMF as well.¹⁰ Earlier the IMF was exclusively concerned with stabilisation. The Polak model for example which provided the basis for the IMF's policy prescriptions concentrated on a few macro level identities and made no attempts at modelling structural adjustment. Its assumptions were questionable (e.g. the absence of any recognition of a demand constraint the attribution of external payments problems exclusively to the government sector's deficit, and the general monetarist bias) but it provided the tool kit for a highly conservative financial institution whose sole concern especially vis-à-vis third world countries was to recover its loans by imposing fiscal discipline upon the latter.¹¹ This ruthless conservatism drew the ire of the third world and indeed of radicals everywhere. But it was the conservatism of a narrow minded financier, not that of an ideologue of development frowning overtly upon any attempt to alter forcibly the colonial pattern of international division of labour. The latter role was left by and large to the World Bank.

A major change took place between the two oil-shocks. While the recycling of resources to the third world such as it was, was organised in the wake of the first oil-shock by the IMF itself the tremendous

growth which took place in the role of the banks in the interim meant that by the time of the second oil shock it was the banks which were doing whatever recycling was to be done and the IMF was called upon only to provide 'security cover' to the banks. This was the beginning of a process from being a leading financier the IMF had got reduced to being a gendarme of international rentier interests. As a gendarme then it had to insist that the countries which were caught under its conditionalities and thereby became possible candidates for receiving funds from international rentiers adopted a host of measures that were to the liking of the rentiers such as privatisation of public assets opening up of financial markets removal of exchange restrictions convertibility of the currency on the current and capital accounts and so on all of which amounted to an espousal of the kind of structural adjustment which the World Bank had also come around to.

To sum up then while the conservatism of the Bretton Woods institutions has continued unabated there have been major changes in the precise texture of this conservatism reflecting changes which have been occurring in world capitalism. Not only have the Fund and the Bank come closer together in terms of outlook, breaking down their earlier separateness, but this coming together has itself been promoted to a significant extent by the vastly enhanced role of globalised finance. One might even add that this ascendancy of globalised finance has been responsible *inter alia*, for keeping down willy nilly what Lenin would have called 'imperialist rivalry' certainly as far as the third world is concerned the governments of the advanced capitalist countries present a remarkably common front and give more or less unanimous support to the structural adjustment measures being imposed by the Bretton Woods institutions.¹²

III

Contradictions of *Dirigiste* Regime

This phenomenon of financial globalisation was bound to affect the domestic economy sucking domestic wealth-holders into its vortex and in the process undermining the viability of the *dirigiste* alternative. For any state intervention to be even remotely effective it is essential that there be some 'control area' within the domain of the state over which it can ensure a degree of correspondence between the intentions behind its policy-actions and their outcome. If finance can flow in or flow out in response to pressures emanating from abroad, if the domestic wealth-holders' behaviour in other words defies the very concept of a 'control area' under the domain of the

nation-state over which it can ensure some semblance of correspondence between the intentions behind its actions and their outcome, then the possibility of state intervention gets eroded. It is not surprising that virtually all forms of interventionism not only traditional socialism, but even Keynesianism, welfarism conventional social democracy, third world nationalism and its necessary accompaniment the *dirigiste* developmental model have all run into rough weather in recent years. The reason for this is not some sudden realisation on the part of everybody of the alleged superiority of the market, but the profound change in the context which has taken place in recent years through the phenomenon of financial globalisation. To say this however is not to suggest that all prospects of progressive economic policies being pursued in particular countries (it will have to be necessarily in particular countries to start with) have disappeared the point is merely to underscore the changed context.

It would be a gross mistake however to hold this changed context alone as the reason for the eventual transcendence of the *dirigiste* regime. The regime had serious internal contradictions which contributed to an erosion of its social stability as well as of its economic viability and propelled it towards a situation where it had no alternative viable responses left to the changed context that we have underscored. In other words it is the interplay between the changed international context and the accentuating domestic contradictions within the earlier regime which give rise to the 'totality' of circumstances that permitted the enactment of the event of historical significance referred to at the beginning of this essay. In the present section we shall discuss these internal contradictions.

A brief clarification however is in order here. The economic policy regime erected in the 1950s was not just a brainchild of then prime minister Nehru and the group around him as is often made out by its admirers as well as its critics. Its roots lay in the freedom struggle itself. The economy had been dominated by metropolitan capital and metropolitan commodities in the pre-independence period. Freedom meant freedom from this domination, and this could not be ensured without giving the state in independent India a major role in building up infrastructure, expanding and strengthening the productive base of the economy, setting up new financial institutions and regulating and co-ordinating economic activity. This was necessary for building capitalism itself, though some no doubt entertained the fond hope that all this would add up to a transition to socialism. State capitalism and state intervention in other words were essential instruments for

the development of a relatively autonomous Indian capitalism, displacing metropolitan capital from the pre-eminent position it had occupied in the colonial economy. It is this displacement which drew the ire of international agencies like the Fund and the Bank (more explicitly as we have seen of the latter). The manner of their intervention has been alluded to earlier; let us move on now to the internal contradictions.

Three mutually reinforcing and interrelated contradictions need to be noted.¹¹ First, the state within the old economic policy regime had to simultaneously fulfil two different roles which were incompatible in the long-run. On the one hand it had to maintain growing expenditures, in particular investment expenditure, in order to keep the domestic market expanding. The absence of any radical land redistribution had meant that the domestic market, especially for industrial goods, had remained socially narrowly-based; it had also meant that the growth of agricultural output, though far greater than in the colonial period, remained well below potential, and even such growth as occurred was largely confined, taking the country as a whole, to a narrow stratum of landlords-turned-capitalists and sections of rich peasants who had improved their economic status. Under these circumstances, a continuous growth in state spending was essential for the growth of the market; it was the key element in whatever overall dynamics the system displayed. At the same time however the state exchequer was the medium through which large-scale transfers were made to the capitalist and proto-capitalist groups; the state in other words was an instrument for the 'primary accumulation of capital'.

It was not of course the only instrument; direct means such as the eviction of tenants, private encroachment on common resources and private encroachment on state-owned resources such as forests from whose use the poor were simultaneously excluded, all played their role. But the state exchequer remained the pre-eminent mechanism for 'primary accumulation'; through the non-payment of taxes (to which the state generally turned a blind eye), through a variety of subsidies and transfers, and through lucrative state-contracts, private fortunes got built up at the expense of the state exchequer.

The contradiction between these two different roles of the state manifested itself, despite increasing resort to indirect taxation and administered price-hikes, through a growth in the government's revenue deficit. A result of it of course was that the fiscal deficit also went up; this however reflected not a step-up in public investment but a decline in public savings. In the 1950s and the 1960s the revenue account of the central government at least was in surplus, but in

the 1970s even this went into a deficit, which climbed steadily from Rs 17,150 million in 1980-81 to Rs 1,05,140 million in 1988-89, Rs 1,19,140 million in 1989-90 and Rs 1,85,610 million in 1990-91. The implications of this growing fiscal crisis were obvious: the government had either to cut back the tempo of its investment or to maintain this tempo through increased recourse to borrowing. If the borrowing is from abroad, then the building up of pressure for a change in the policy regime is obvious. If the borrowing is domestic then private wealth-holders may be willing to hold claims upon the state only after they have increased their holdings of other assets, such as urban property or consumer durables or commodity stocks, in which case, *ceteris paribus*, the inflationary impact of a given tempo of public investment keeps increasing. And, since rampant inflation cannot be allowed in a system of parliamentary democracy with virtually non-existent indexation for the vast bulk of the workers, the state would sooner or later have to cut back its expenditure, especially investment expenditure, which would slow down the economy and eventually arouse capitalists' demands for an alternative policy regime. Even if private wealth-holders are willing temporarily to hold government debt without there being any inflationary pressures immediately, this only accentuates the inflation-proneness of the economy in the long-run with identical results. In short, the regime gets progressively engulfed in a crisis. In its efforts to combine political legitimacy with economic dynamism it increasingly comes a cropper.

The second contradiction lay in the inability of the state to impose a minimum measure of 'discipline' and 'respect for law' among the capitalists, without which no capitalist system anywhere can be tenable. Disregard for the laws of the land, especially tax-laws, was an important component of the primary accumulation of capital. The same disregard, the same absence of a collective discipline which a capitalist class imposes upon itself in any established capitalist country also meant that a successful transition could not be made from a Nehruvian interventionist regime to an alternative viable capitalist regime with state intervention, but of a different kind. After all, the state is strongly interventionist even in a country like Japan, but it is interventionism based on close collaboration between the state and capital which simultaneously promotes rigorous discipline among the capitalists. To be sure the extent and nature of state intervention in Japan is itself a result of specific features of the Japanese civil society as it has developed historically which cannot simply be emulated elsewhere. Indeed the point being made here,

namely, the inability of the Indian state to promote a measure of discipline among the Indian capitalists is obviously merely a descriptive one, the analysis of which has to be located in the specific nature of the Indian society and polity – a task outside the scope of this paper. But the description is important; it provides a proximate explanation of why the retreat from Nehruvian *dirigisme*, instead of leading to an alternative viable capitalist regime carving out a space for itself in the international economy, through an alternative mode of state intervention, has resulted in a situation where the economy is left to the caprices of international capital. Indeed many advocates of a retreat from Nehruvian *dirigisme* had turned explicitly to the Japanese 'model' and had hoped for a new consolidation of Indian capitalism much in the way that Japanese capitalism had consolidated itself. They were of course being unhistorical; an important aspect of their unhistoricity was their refusal to recognise the inability of the Indian state to impose a measure of 'discipline' on Indian capital.

The third contradiction had its roots in the cultural ambience of an ex-colonial society like India. The market for industrial goods was from its very inception, as we have seen, a socially narrowly-based one. Capitalism in its metropolitan centres however is characterised by continuous product innovation, the phenomenon of newer and ever newer goods being thrown on to the market, resulting in alterations of lifestyles. In an ex-colonial economy like India, the comparatively narrow social segment to whose hands additional purchasing power accrues in a large measure and whose growing consumption therefore provides the main source of the growth in demand for industrial consumer goods is also anxious to emulate the lifestyles prevailing in the metropolitan centres. It is not satisfied with having more and more of the same goods which are domestically-produced, nor is it content merely with expending its additional purchasing power upon such new goods as the domestic economy, on its own, is capable of innovating. Its demand is for the new goods which are being produced and consumed in the metropolitan centres, and which, given the constraints upon the innovative capacity of the domestic economy, are incapable of being locally-produced purely on the basis of indigenous resources and indigenous technology. An imbalance therefore inevitably arises in such economies between what the economy is capable of locally producing purely on its own steam, and what the relatively affluent sections of society who account for much of the growth of potential demand for consumer goods would like to consume. This imbalance may be kept in check by import controls, though

such controls inevitably give rise to clandestine imports through smuggling which are sold in local black markets. But even leaving aside such clandestine imports, the more the imbalance between what is produced and what is sought to be consumed is kept in check through controls, the more it grows because of further innovations in the metropolitan economies.

The result is a powerful build-up of pressure among the more affluent groups in society for a dismantling of controls. The fact that this would result in substantial sections of domestic producers going under i.e. in a de-industrialisation in the domestic economy together with an accentuation of the already precarious balance of payments situation does not come in the way of such pressures being built up. The inculcation of a desire to emulate the fashionable lifestyles prevailing in the metropolitan countries among segments of the underdeveloped economy acts as a powerful instrument in the hands of metropolitan capital in its efforts to prise open the market of such an economy and to wrest back the space which it had yielded as a result of granting political independence. The contradiction between the extant production pattern and the desired consumption pattern of the affluent sections of the population contributes to a dismantling of the *dirigiste* economic regime. And this contradiction too has been manifest in India.

The net result of the working out of all these contradictions has been evident in the Indian economy for quite some time. The growth in the index of manufacturing industrial production which is a barometer of the expansion in the possibilities of productive accumulation is quite revealing. The growth rate figures for different periods are summarised in Table 2.

After 15 years of rapid industrial expansion in the 1950s and the early 1960s, there was a dramatic decline in the rate of manufacturing growth during the next 15 years. Even though the growth rate picked up somewhat in the early 1980s, it was still nowhere near the rates witnessed in the first 15 years of planning. It is only after the mid-1980s that a pronounced boom occurred once again in the manufacturing sector of the Indian industries, to be followed by the adjustment-induced recession of the 1990s.

The fact that the 15 years after the mid-1960s which were characterised by a relative stagnation in manufacturing output also witnessed a decline in the rate of growth of public investment compared to the earlier period is well known. The increasing fiscal difficulties faced by the state which were manifested *inter alia* in the revenue account of the central government itself running into a deficit during the course of this period, and which were a result, as we have argued, of its role in promoting 'primary accumulation

of capital' entailed that the state could not adequately fulfil its other role namely as an expander of the market, a number of industries which catered to mass consumption or to the investment requirements of the state vanished. And the slower expansion of public investment also meant a slower growth in the productive potential of the industrial sector on account of the infrastructural constraints that resulted from such slower expansion.¹⁴

Given the sluggish growth of the home market breaking into export markets could have provided a new stimulus to industrial expansion and a new basis for capital accumulation in productive channels. But export markets were dominated by metropolitan capital. To permit Indian capital a share of this export market as a junior partner, metropolitan capital demanded a price namely that it too should have a share of the Indian market. Any attempt by Indian capital to break into export markets, not as a junior partner of metropolitan capital but independently (through making use of imported technology where necessary) required a massive effort of its own backed by the Indian state. This however never became a serious possibility owing among other things to the reason mentioned earlier namely the unwillingness of Indian capital to accept a certain minimum discipline imposed by its own state upon itself which was necessary for the purpose and which underlay the international successes, for example of Japanese capitalism. The export prospects of Indian capital consequently remained bleak.

In this context a schism developed within the ranks of the Indian capitalists. A section was willing to make compromises with metropolitan capital on the terms that the latter demanded, it was all for allowing metropolitan capital to capture a share of the Indian market even at the expense of the entrenched capitalists, not to mention the public sector in the hope of being able to better its own prospects as a junior partner, both in the domestic as well as in the international market. It was thus in favour of import liberalisation, a full retreat from Nehruvian *dirigisme* and accepting the kind of regime that metropolitan capital generally, and the Bank and the Fund as its chief spokesmen, had been demanding. The more powerful and the more entrenched monopoly houses however were more circumspect. They would not mind import liberalisation in areas other than their own, including in areas dominated by the public sector, they would not mind collaborating with foreign capital to add to their empires and hence a degree of relaxation of controls to further facilitate such collaboration, but they would not like encroachments by metropolitan capital upon their own empires. Their attitude

towards Fund Bank style liberalisation therefore was more ambiguous.

Support for Fund Bank style liberalisation was growing not just among a section of capital. A whole new category of an altogether different kind of businessmen was coming up who were more in the nature of upstarts, international racketeers, fixers, middlemen often of non-resident Indian origin or having NRI links, often linked to smuggling and the arms trade, these in any case did not have much of a production base, and their parasitic intermediary status as well as the international value of their operations naturally inclined them towards an open economy. On the other side among the affluent groups of consumers, the desire for an 'open economy' where they could have access to a variety of goods available abroad but not at home, had also grown strong. And finally as we have already mentioned earlier, one should not exclude a section of the top bureaucracy itself, which had close links with the Fund and the Bank either as ex-employees who might return any time to Washington, DC or through being engaged in dollar projects of various kinds or as hopeful aspirants for a lucrative berth in Washington, DC, the weight of this section in the top bureaucracy had been growing at an amazingly rapid rate, and its influence naturally was in the direction of adopting the Fund Bank policy regime.¹⁵ In short quite apart from the growing leverage exercised by the international agencies in their capacity as donors, the internal contradictions of the Nehruvian *dirigiste* policy regime generated increasing support within the powerful and affluent sections of society for changing India's economic policy regime in the manner desired by these agencies.

It is against this background of a two decade long sluggish industrial growth on the one hand, and growing pressures for a retreat from interventionism and the adoption of a Fund Bank style 'liberalisation' package on the other that the economic policies of the latter half of the 1980s, that marked in several ways a new departure, have to be located. Briefly, three new features characterised these policies. First, there was a significant increase in the magnitude of the government's deficit as a proportion of the GDP at current market prices. The gross fiscal deficit of the central and state governments averaged 9.5 per cent of GDP during 1985-86 – 1989-90 and touched 10.1 per cent in 1990-91. However, this was not due to any increase in the share of public investment, but largely to a decline in the share of public savings, reflected in the burgeoning revenue deficit (which rose from an average of 2.8 per cent of GDP during 1985-86 – 1989-90 to 4.5 per cent in 1990-91), with the current expenditure of

the state growing at a rate far outstripping the growth in tax as well as non-tax revenues despite hikes in indirect taxation and in administered prices. Partly this was because of the government's refusal to garner larger direct tax revenues.¹⁴ Partly this was because of the growing expenditure on interest payments (the sins of past deficits catching up with the government) and on subsidies, especially on fertilisers (caused primarily by wrong technological choices involving the setting up of plants with extraordinarily high capital costs). And partly this was because of the general profligacy which characterised the then government to an unprecedented extent.

The second feature was the liberalisation of imports of capital goods and components required for a number of commodities catering to luxury consumption, especially of electronics and automobiles. This was justified in the name of 'marching to the 21st century'. And important government officials unashamedly put forward the argument that since even the small segment of the population that demanded such goods amounted in absolute terms to a fairly large number, the country could go forward on the basis of such an industrialisation strategy whose benefits would eventually trickle down to the poorer sections of the population as well.

The remarkable aspect of the policy of import liberalisation of the late 1980s was that it was not necessarily tied in to a larger export effort. Its main immediate thrust was towards producing more goods, luxury goods, for the domestic market. In 1985-86, the very first year that the policy was introduced, there was a dramatic increase in the trade and current account deficits: the latter from 1.24 per cent of GDP to 2.26 per cent. True it reached a plateau thereafter (1.99-1.89 and 2.66 per cent in the three subsequent years), because of which many have argued that it would be unfair to blame the Rajiv Gandhi government for import profligacy. But this argument misses two important points: first, the high absolute level of the trade and current deficits were sustained despite the fact that owing to the development of the Bombay High oilfields, India's oil import bill came down in absolute terms between 1984-85 and 1988-89. But for the import profligacy, in other words, the trade deficit should have declined significantly in absolute terms since mineral oil and related products accounted for nearly a third of India's import bill on the former date. Secondly, the remittance inflows during this period had flattened out and soft loans were becoming more and more difficult to come by. The need was to conserve foreign exchange and the maintenance of a high, even though steady, absolute level of the trade deficit was a mark of profligacy. And

over two fifths of the increase in import value between 1984-85 and 1988-89 (barring what are virtually re-exported) was on account of machinery and transport equipment which went to a significant extent into the production of a variety of goods for the elite market.

The third new feature was a systematic resort to commercial borrowing abroad including from the NRIs. As the trade and current account deficits went up in the latter half of the 1980s, commercial borrowings were increasingly resorted to which in turn contributed with a lag to keeping up the current account deficit itself (owing to interest payments) and necessitated further borrowing, both for this reason as well as for amortising past loans. Debt has a habit of escalating rapidly, feeding upon itself, and as fresh debt is contracted to pay off old debt, the terms at the margin become stiffer, the maturity period shorter and hence the rate of escalation of debt even steeper. And this is precisely what happened. The debt in dollar terms nearly quadrupled during the 1980s, from \$ 20 582 million in 1980 to \$ 81 994 million in 1990; debt to banks and private individuals increased more than 10 times from \$ 1 997 million to \$ 22 387 million. India's debt service payments absorbed 21.2 per cent of her exports in 1990.¹⁵

If the large fiscal deficits of the late 1980s had not been accompanied by large current account deficits, the balance of payments, the inflationary overhang would have grown faster and there would have been much higher inflation in the 1980s than actually occurred. On the other hand, if the current account deficit had been as large as it was owing to import liberalisation, but the fiscal deficits had actually been smaller, then imported goods would have outcompeted domestic goods to a greater extent (since the home market would have been narrower with a smaller fiscal deficit) and there would have been greater de-industrialisation and hence a smaller rate of industrial growth.

The odd thing about industrial growth, however, was that notwithstanding its impressive rate, it had limited impact upon industrial employment. Between end March 1985 and end March 1990, employment in the (organised) private sector went up by a mere 2 73 000 or 3.7 per cent in five years, while in the private manufacturing sub-sector it actually declined by 16 000. Even in the public manufacturing sector it went up between these two dates by a mere 1 09 000 or 5.8 per cent. Thus the acceleration of industrial growth appears to have had no significant impact on industrial employment.

The industrial boom of this period, however, even as it tried to paper over the basic contradictions of the regime, and that too apparently successfully, left the economy

on a powder keg. The enormous external debt, a growing portion of it being in the form of short-term borrowing, made the economy acutely vulnerable to currency speculations and confidence crises of international investors, a vulnerability that was an entirely new phenomenon for the Indian economy. The liquidity build-up in the domestic economy which inevitably followed made it acutely vulnerable to sudden inflationary upsurge. The consequences of both these phenomena in precipitating the crisis of 1991 have been explored earlier. What we turn to now is the fall out of the adjustment process adopted in response to this crisis.

IV

Progress of Structural Adjustment

The most palpable impact of structural adjustment has been an increase in rural poverty. Using the norm set out by the Planning Commission, the head count ratio, measure of poverty for rural and urban India, moved as shown in Table 3. These results are fairly robust in the sense that other researchers have come to identical conclusions, and other poverty measures too reveal exactly the same picture. While the fact of an increase in poverty is undeniable, the supporters of structural adjustment attribute this fact to causes other than the process of adjustment. It is argued, for instance, that the main cause of the increase in rural poverty in 1991-92 was the increase in the consumer price index for agricultural labourers, which went up by 19.3 per cent in that year on an average of months basis and 21.9 per cent on the full month of the year basis, and that this increase was largely a result of a crop shortfall together with price hoarding.¹⁶

That this explanation would not do is obvious from the following: the output fall in 1991-92 affected only the kharif crop when foodgrains production fell from 99.44 million tonnes to 91.49 million tonnes, and not the rabi harvest (comprising largely of wheat) which was more or less stable at its 1990-91 record level of 76.95 million tonnes, with the 1991-92 figure being 76.79 million tonnes. Further, within the kharif crop, the principal cereal, rice, also recorded a marginal increase from 66.32 million tonnes to 66.37 million tonnes. The decline in kharif foodgrain production was due to a decline in the production of coarse cereals from 32.7 million tonnes to 26 million tonnes, and of pulses from 5.4 million tonnes to 4.1 million tonnes. Further, throughout 1992, wheat stocks with the government were higher than the minimum norm for public stocks, though this was not true of a kharif cereal like rice. In short, in terms of availability (ignoring private hoarding) or in terms of

the ability of the government to counter reduced supplies on account of private hoarding there is absolutely no reason why wheat prices and perhaps even rice prices should have gone up at all even if it is conceded for argument's sake that other kharif cereal prices could have. And yet we find that the average-of-months index of wholesale price for wheat went up by as much as 18.6 per cent in 1991-92 and 21.9 per cent for rice.

The reason for this dissociation between the pattern of price movements and the pattern of apparent demand supply imbalances and hence for the irrelevance of these apparent imbalances as the explanatory variable for price movements lies in the fact mentioned earlier of the increase in the issue prices of the public distribution system. In December 1991 the issue price of the common variety of rice was hiked by 30.4 per cent and of wheat by 19.7 per cent which was in addition to the increases in June 1990 mentioned at the beginning of this essay.

Structural adjustment in other words has necessarily entailed costly food for the working people. And there is nothing to be surprised about it because it is part of the logic of structural adjustment by insisting on a reduction in the magnitude of food subsidy by insisting on an elimination of all input subsidies into agriculture (of which the fertiliser subsidy was the most important element in India) and at the same time by insisting that the prosperous farmers should not only get remunerative prices but in fact international prices in a regime largely of unfettered producer choices in matters of production and exchange of agricultural commodities it necessarily ensures that the price of food in terms of the wage unit especially in the unorganised sector goes up. A rise in rural poverty is an inevitable consequence of this phenomenon.

The second notable consequence of structural adjustment has been a virtual stagnation in per capita income. For the period 1987-88 to 1990-91 per capita national product at 1980-81 prices went up by 17 per cent for the subsequent three years the order of increase was 7.6 per cent. If the agricultural sector is kept out of the picture as has been in some ways a *sine qua non* for the picture is even more dismal. The growth rate of the industrial sector (measured by the index of industrial production which was 8.2 per cent per annum for the four years ending 1990-91) came down sharply to 4.2 per cent for the subsequent four years; the corresponding figures for the manufacturing segment of the industrial sector were 8.5 per cent and 3.9 per cent respectively.

Of course in judging the impact of Fund Bank style reforms on macro economic performance one has to exercise particular caution. These reforms are inevitably

associated with deflation in the short-run, and it is only after a while that the economy is expected to pick up on the basis of stimuli other than those which prevailed under the dirigiste regime. In short, a transitional period of stagnation is expected (though not strictly on the basis of the IMF's theory which does not cognise any demand constraints), and should not cause undue worry, provided growth subsequently picks up on a new basis. In the case of India indeed there has been a pick up and the dismal four-year industrial performance that we have mentioned above is composed of two years of absolute stagnation followed by two years of recovery; the annual growth rates in the manufacturing sector have been minus 0.8 per cent (for 1991-92), 2.2 per cent, 5.5 per cent and 8.8 per cent respectively.

On the basis of these figures many have argued that the Indian economy too has turned the corner under structural adjustment. This proposition however is completely erroneous because the basis for this improved performance is an enhanced fiscal deficit which the government has sustained because of the manoeuvrability that consecutive good monsoons and rising foreign exchange reserves fed by volatile capital flows have provided it. Needless to say this strategy has been pursued against the wishes of the Fund and the Bank owing to the compulsions of a parliamentary democracy to remain too openly dissociate from this component of the government's strategy. In short the revival of the industrial sector in the last five years is the result not of the success of Fund Bank reforms but of the government's partial surreptitious withdrawal from it. Let us turn briefly to this important issue.

The various deficit measures of the central and state government (together net of inter-governmental transactions) as proportions of GDP moved as follows: the gross fiscal deficit which averaged 9.5 per cent during 1985-90, came to 10.1 in 1990-91 (just before the reforms were introduced), 7.5 in 1991-92 and 7.4 in 1992-93; it went back to 9.0 in 1993-94, the first year of industrial recovery, and 8.4 according to the revised estimates for 1994-95 (the final figure is likely to be higher). The relationship between the expansion of the fiscal deficit and industrial performance is absolutely unmistakable.

The remarkable aspect of the increase in the fiscal deficit however is the component of it which has increased. It is not the pace of capital formation under the aegis of the state which has increased but the revenue deficit. The revenue deficit of the centre and the states as a proportion of GDP which had averaged 2.5 per cent during the quarter century 1955-90 went up to 4.5 per cent during 1990-91 on the eve of structural

adjustment, and then having come down to 3.6 and 3.4 during the next two years (marked by industrial stagnation), climbed up to 4.6 per cent during 1993-94, the revised estimates for 1994-95 put it once again at 4.6 per cent. One reason for this faster rise in the revenue deficit is of course burgeoning interest payments which are the price of past profligacy. The other is that while the government has accepted the marketist argument which comes with structural adjustment that the state should refrain from involving itself in production as far as possible and even dispose of its profit-making assets it is encouraged by the improved food and foreign exchange reserve position and forced by the political compulsions of democracy to ignore IMF Bank pressures to curtail overall government spending.

Three conclusions immediately follow: first, if the objective of the reforms was to introduce discipline into the government's current account (an objective which many Indian economists and civil servants influenced by Buchanan and others considered to be a sufficient justification for IMF tutelage) then they have been a miserable failure. Second, the increase in the government's current account deficit has been camouflaged in part by a curtailment in its investment expenditure: the overall fiscal deficit has gone up in the last two years but not by as much as the revenue deficit. And thirdly, as mentioned earlier, this deficit expansion has stimulated a conventional industrial expansion of sorts in the last couple of years which has nothing to do with any successes of structural adjustment.

This pattern has extremely serious implications which brings us to the third notable feature of structural adjustment, namely, a sharp decline in the investment ratio in the economy. Gross fixed capital formation as a proportion of the GDP at current market prices which was 22.5 per cent in 1989-90 and 23.2 per cent in 1990-91 on the eve of structural adjustment was 22.2, 21.5 and 20.9 per cent respectively for the next three years. The corresponding figures for gross domestic capital formation which is inclusive of changes in stocks were 25.0, 27.1 (on the eve of structural adjustment), 23.6, 22.0 and 20.4 per cent. During the period of structural adjustment the pace of capital formation in the economy has gone back to what it was approximately a decade ago.

The decline in the pace of capital formation is confined not just to the public sector but has occurred in the private sector as well. As compared with its 1990-91 level of Rs 312.9 billion (at constant 1980-81 prices) capital formation in the private sector amounted to Rs 279.1 billion, Rs 274.1 billion and Rs 290.8 billion respectively in 1991-92, 1992-93 and 1993-94. This is

not surprising a number of researchers have drawn attention to the fact that in the Indian economy, both in the agricultural as well as in the industrial sectors public investment tends to stimulate private investment, i.e. has a crowding in rather than a crowding out effect on private investment (any possible temporary crowding out owing to input shortages amounts at most to a *postponement* of private investment without disturbing the overall relationship).¹

The government's deficit here has an extremely important role to play. If the increased deficit is used for stepping up public capital formation, then not only does it stimulate the economy from the demand side, but also keeps relaxing from the supply side, both through its direct effect on the magnitude of capital stock as well as through its indirect effect via stimulating private investment, any potential inflationary constraints upon the economy's expansion. On the other hand, if the increase in the government's deficit is confined to non-capital expenditure, then revival of the economy would necessarily be brief and evanescent since such a revival would fairly soon run into an inflationary barrier.

This consideration is particularly important for an economy where agriculture accounts for a major part of the consumer goods sector. It may, for instance, be argued that any government expenditure (even non-capital expenditure) by stimulating the economy would all fortify private investment via multiplier effects, so that the inflationary barrier would keep getting pushed back; this argument however would certainly not hold in the case of agriculture. Private investment in agriculture is not governed by any version of the accelerator (or capacity utilisation or even profit) principle. It depends essentially upon the availability of complementary inputs like supra-individual irrigation facilities, power, extension facilities, seed, fertiliser packages etc. whose provision is contingent upon public investment effort. In short, in an Indian type economy it is not just any expansion in the government's deficit which can trigger off a sustained boom, but an expansion that takes the form of a larger investment effort. And this is precisely what the last two years' deficit expansion has not been used for.

To avoid possible confusion, a word on the quirks of Indian statistics is necessary here. If one looks at the areas where the recent industrial expansion has occurred, then capital goods industries come out at the top. This gives the impression that the industrial recovery is indeed investment-led. But the contradiction between the assertions that the pace of capital formation has been declining and that the capital goods industries are prospering vanishes the moment we realise that in India the entire

'transport equipment' sector including passenger automobiles and the entire 'electrical machinery' sector including electronic gadgets of all descriptions are lumped together under capital goods. These sectors have been witnessing a deficit sustained boom recently, but this fact does not help at all in pushing outwards the inflationary barrier arising from the wage goods sector, especially in a situation where agricultural exports are being increasingly resorted to under the impact of the reforms (on this more later). Inflation in the economy is once again particularly severe on the agricultural labourers, whose cost of living index is increasing at the rate of 10.6 per cent annually, an extremely high figure for a sector characterised by rampant poverty and no wage indexation for the poor.

Underlying the decline in the pace of capital formation is the non-fulfilment of a crucial assumption of the Fund Bank package. And this brings us to the fourth notable feature of the Indian experience. The assumption usually made is that once the economy starts pursuing market friendly policies, direct foreign investment (DFI) would start coming in and raise the investment ratio in the economy even if the state withdraws from its role as investor. This assumption, often justified with reference to the East Asian (including Chinese) and South East Asian experience, is in fact based on a *misreading* of that experience (since direct foreign investment supplements extraordinarily high domestic savings ratios in those countries) and Fund Bank reform packages do not in any case constitute the foundation of economic policy in the Indian case. DFI inflows have been minuscule.

To be sure, there have been plenty of DFI *approvals* indeed the cumulative number of DFI approvals between April 1991 and May 1995 comes to Rs 30 700 million, or just over \$ 10 billion. But the actual cumulative inflow over this period comes to a mere Rs 86 465 million or less than \$ 3 billion. Even if one forgets the earlier part of this period and looks only at the latest year, the DFI inflow amounts to less than \$ 1 billion.

While DFI inflows into the economy have been sparse, what has come in in large magnitude is foreign currency deposits and portfolio investment, which are essentially indistinguishable from 'hot money'. This point is of course of an extremely important aspect of the reality of contemporary capitalism, namely, that *unlike what many Marxists, including radical ones, assert, what actually happened in capitalism is not a chaotic chase towards globalisation, but a definite tendency to ardent internationalisation*. We have suggested earlier that the Fund Bank structural adjustment package, though advocated on

the grounds that its adoption would draw DFI in large quantities, has evolved through time to cater in practice largely to the requirements of international *rentiers' interests*. Paradoxically, the adoption of this package, even when it succeeds in attracting large amounts of 'hot money', cannot generate growth in the economy, and of course when 'hot money' flies out, growth suffers through enforced deflation for the sake of creating creditors' confidence. In other words, this package, if conscientiously adopted, binds the economy to stagnation in years of comfortable foreign exchange and retrogression in years of foreign exchange crunch, giving rise to a combination of net retrogression and denationalisation of the nation's assets and natural resources.

Let us analyse this mechanism briefly before discussing the Indian case. When 'hot money' flows occur, the recipient country has two choices: either to maintain the exchange rate by adding to reserves, or to prevent a swelling of reserves by letting the exchange rate appreciate. Any government wishing to prevent a gratuitous 'deindustrialisation' of the economy (and hence a gratuitous manufacture of current account deficit to accommodate 'hot money' inflows) would of course prefer to prevent an exchange rate appreciation by adding to exchange reserves. And since these enhanced reserves represent after all an additional command over resources, even 'hot money' flows, if may be thought, can add to the pace of capital formation if properly utilised.

The problem however is two-fold: the minor problem relates to the fact that using reserves built up with 'hot money' for undertaking investment implies in essence that the country is borrowing short to invest long, which exposes it to potential crises. But even if this is tackled by choosing short maturities for foreign exchange earning investment projects, there remains a major problem, namely, there has to be *much* more than mere 'hot money' to bootstrap capital formation and in effect only under Fund Bank thirdism lacks such an agency. Since the rate of interest is forced to withdraw from its investment role, it cannot step up investment directly. Since the state cannot order private investment, it can stimulate the latter only indirectly, but the obvious indirect instrument, namely, the interest rate, can scarcely be used for fear of frightening international rentiers. And portfolio investment which typically stimulates stock market booms, makes speculation more attractive than productive investment for the domestic capitalist. Finally, since market friendliness take the form *inter alia* of trade liberalisation which brings in MNC products to the local market, this fact tends to dampen the inducement to invest of domestic capitalist.

The upshot is that foreign exchange reserves accumulate even as productive investment languishes. The reserve accumulation, it may be thought, would give rise to a *consumption-led boom*. But, for reasons already discussed, credit to finance such a boom is expensive. And even if it does play a role, the boom would be a brief and evanescent one, until domestic supply constraints begin to appear (at which point reserves would start getting used up to augment supplies and the domestic multiplier effects of higher consumption would disappear). What is even more likely, however, is that such consumption growth as occurs owing to the effects of hot money inflows would, in a 'liberalised trade' regime, leak out abroad without generating any domestic growth.

On the other hand, when hot money flows out, the very fact that the reserves have shrunk in the event of higher domestic consumption (or if the outflow is larger than the extant reserves can sustain), the economy has to be deflated, and a whole lot of measures, including handing over the country's natural resources 'for a song' to international creditors, have to be adopted, to cope with the foreign exchange crunch. The net result is a process of gradual economic atrophy together with 'denationalisation' of assets and resources.

The relevance of the above discussion becomes obvious when we note that, even as DFI inflows remained minuscule, India's foreign exchange reserves kept increasing through the inflow of hot money: they were \$ 5.8 billion at end-March 1991, \$ 9.2 billion in 1992, \$ 9.8 billion in 1993, \$ 19.3 billion in 1994, and \$ 25.2 billion in 1995. As we have already seen, this very period of increasing reserves was marked by a decline in the pace of capital formation. True, there was a recovery of the industrial sector but that was largely government-deficit-sustained rather than monetary policy-induced,²⁴ so that the increased reserves in themselves were scarcely of much significance in causing it. There was, and still is, tremendous pressure from the Fund and the Bank for liberalising consumption goods imports on the strength of the huge reserves, and for curtailing the fiscal deficit. *If the Indian government listened to this advice*, it would usher in simultaneously a combination of: industrial retrogression, a decline in reserves for financing a consumption splurge by the affluent, and the creation of the very conditions for the process of atrophy-cum-denationalisation outlined above. The government has so far resisted these demands citing the compulsions of an election year, but having succumbed to structural adjustment it may find it difficult to continue resisting these demands for long, and indeed even to resist the accompanying

demand for full capital account convertibility of the currency.

Finally, there is one other aspect of structural adjustment which deserves mention. An influential argument which was accepted by many at the beginning of structural adjustment was that a 'retreat of the state' and the exposure of the economy to the discipline of the market forces would cut out arbitrariness of decision-making and the corruption that is inevitably associated with it. It would streamline the functioning of the economy by making it a 'rule-governed system', though admittedly the rules were those of the market. What has happened, instead, in the Indian economy during this period of structural adjustment is an increase in the level of corruption, cronyism, and arbitrariness to unprecedented levels. The privatisation exercise, as in other countries such as Bangladesh, has been an utter scandal. Precious natural resources, hitherto kept inside the public sector, are handed over for a pittance (and alleged 'kickbacks') to private firms with dubious objectives. The case of the Enron deal where massive contracts were signed without an open tender and at inflated capital costs, with guaranteed rates of return, has already attracted international attention. In short, the so-called 'discipline of the market' has proved to be a chimera.

But this is hardly surprising. As Lenin had pointed out long ago, finance capital is associated with swindles, bribery and corruption, or what European 'professors' of his time condescendingly called 'the American ethics'.

V The Alternative

What comes through clearly from the Indian experience with structural adjustment is the dominant role of the process of globalisation of finance. We have suggested earlier that indeed the very design of the current package of structural adjustment bears the imprint of this process; and the sequel to the introduction of this package shows that the real mobility witnessed is that of finance rather than that of capital-in-production. But then if globalisation of finance restricts the possibility of intervention within a 'national' (or for that matter any supra-national but restricted) space by undermining the concept of a 'control area', the question naturally arises: can there be any sort of an alternative to the current set of policies? To say that an alternative presupposes *international co-ordination*, and can no longer be based on a national, or any kind of a spatially-restricted, response, a proposition which some radicals advance, is inadequate. It amounts *de facto* to conceding that a feasible alternative to the current set of policies does not exist.

It is our contention however that a feasible alternative, not just a desirable one, to the existing policies exists. We should draw a distinction here: obviously the East Asian and the South-East Asian cases underscore the possibility of a successful, neo-mercantilist (and in that sense nationalist) policy response in the contemporary environment. But those cases are also marked by economies where the development of financial institutions and hence the possibility of integration with global finance are limited to start with. China's stock exchange is very recent in origin, Vietnam does not even have one to date, and even in avowedly capitalist East Asia financial interests have generally played second fiddle (except briefly in Japan). One cannot of course recreate those initial conditions (and other conditions conducive to neo-mercantilism) in India, apart from being unhistorical that is not even necessarily desirable, since neo-mercantilist strategies have been associated with politically authoritarian structures. So, in discussing an alternative we have to talk of a *sui generis* alternative. And the question is: is it feasible?

The fallacy in our view lies in believing that an undermining of the 'control area' of the nation-state is tantamount to an impossibility of intervention. What such undermining does is to impose an important additional *constraint* upon the nation-state; the nation-state cannot certainly intervene in the *old* way. It can now intervene with some degree of success *only* if it takes this constraint into account.

Specifically, for economies like India this involves that the volatility of financial flows has to be kept under check through a combination of: (i) direct regulations; (ii) an overall sound balance of payments (in relative terms, which is not synonymous with neo-mercantilism); (iii) and, above all, through a development strategy which ensures economic advance with social stability.

(i) The main form of direct regulation that we have in mind is of course a mix of capital flow controls with a non-convertible currency. External pressures against such regulation would be strong; but a country the size of India can, if she so chooses, show sufficient resilience to stand up to such pressures. After all even the current government, committed as it is to structural adjustment, has not moved towards full convertibility despite external pressures.

The real problem, it may be thought however, would be of a different kind: globalisation of finance is such a strong process that direct regulation may prove ineffective in stemming illicit flows. But to believe that the existence of regulations makes *no* difference to the behaviour of economic agents is fallacious. And the effectiveness of regulations depends upon the character, and hence the social basis, of

the state (a proposition which must not be confused with the view that an authoritarian state regulates more effectively; indeed we argue the contrary). The alternative we have in mind is not confined to merely having regulations by the extant state, but encompasses, as we shall see, a change in the character of the state.

(ii) Regulations, however, have to be backed by a sound balance of payments position through a sound *trade performance*. A part of the key to such a sound trade performance lies in the imposition of intelligently-devised import controls; at the same time, however, a sound export performance is essential. While the importance of boosting exports is stressed by neo-classical economists, they never distinguish between primary commodity and manufacturing exports. In agriculture, as already mentioned, private investment is predicated upon public investment; and if the latter cannot be augmented, either because the system is already agricultural-supply-constrained *pace* Kalecki (and hence up against the inflationary barrier),²⁶ or because the state is being made to withdraw from its investing role, then an increase in agricultural exports necessarily means a lower profile of domestic availability, which has the effect of *both* impoverishing the domestic working masses, *as well as* contracting the home market for manufactured goods.

Manufacturing exports, however, as Kaldor had argued long ago,²⁷ are in an altogether different category. To the extent that investment decisions here are induced by larger capacity utilisation, larger exports provide both the inducement as well as the material wherewithal (from the supply-side) for larger investment. Manufacturing exports in other words can provide the basis for a self-sustaining growth-process in a way that agricultural exports (except under special circumstances) cannot. The history of colonial India provides ample evidence for this proposition: the last half-century of colonial rule saw both a stagnant per capita agricultural output and a rise in the proportion of exports out of it, resulting in a sharp decline in the per capita availability of foodgrains, from about 200 kg. per year at the turn of the century to about 150 kg. at independence.

An alternative development strategy therefore must specifically aim at increasing the exports of manufactured goods. And this requires not 'getting prices right' in some neo-classical sense, but above all high rates of investment which increase the flexibility of the economy's response to the changing international environment. The correlation between high investment ratios and high export growth rates in cross-country data relating to a host of underdeveloped countries

is strong.²⁸ The direction of causation is always seen to lie from exports to investment, but a mutuality of causation is much more plausible in which case it is not exports which need be the initial intervention variable but the investment ratio itself.

(iii) This brings us to the main issue, namely, the alternative development trajectory. Any meaningful development strategy for India, it seems to us, must aim to bring about an *immediate* improvement in the living conditions of the working masses, especially in the rural sector, i.e. the *modus operandi* of the development strategy itself must be such an improvement in their living standards. This is not merely an ethical proposition, but a practical necessity, both for the preservation of meaningful democratic structures, as well as for arousing the kind of enthusiasm and participation among the masses on the basis of which alone the structures of a more accountable state, a state capable of imposing discipline upon the rich and the capitalists, can be built. Such an immediate improvement must have as its cornerstone an accelerated agricultural growth based on egalitarian land reforms. The East Asian example has shown the importance of land reforms even for a neo-mercantilist strategy of economic nationalism, indeed it is important for *any* national economic programme. The Chinese example has shown the vigour of an industrialisation drive based on an expansion of mass markets deriving from an accelerated agricultural growth. In their specific context, at the present conjuncture, this growth has been achieved through a break-up of communes though on the basis of the groundwork, e.g. the destruction of landlordism and the erection of water-management systems, prepared earlier. In India at the present conjuncture accelerated and dispersed, i.e. not regionally concentrated, agricultural growth requires i.e. institution of land reforms.

Together with land reforms of course a number of complementary areas have to be dealt with such as irrigation and water management, rural infrastructure, literacy, sanitation and drinking water, etc. All these would require considerable investment, but investment that is best undertaken under the aegis of elected local-level bodies. The requirement therefore is also for a devolution of resources and decentralisation of planning. But the resources themselves have got to be raised and there is no escape from heavier doses of direct taxation, of property at any rate if not of incomes (though tax evasion in the latter case has to be stopped through punitive action). It is here that the conflict between the strategy just advocated and 'marketism' becomes apparent. It is often argued by 'marketists' that they are all for rural development. But if tax concessions

have to be doled out to entice capital to stay in the country, if food prices have to be raised for the surplus food producers (who happen to be the rural rich) while food subsidies are cut, if all talk of land reforms is eschewed, if financial reforms do away with any system of earmarking of credit, and if even infrastructural development like power becomes the responsibility of the private sector, especially foreign capital, with profitability being the main consideration, then there is no scope left for an improvement in the conditions of the rural poor, or for rural development generally.²⁹

VI

Concluding Observations: Primacy of Politics

It is not enough, however, that an alternative programme exists, it is not even enough that one can identify in the abstract the class forces that are potentially capable of providing the social support for the implementation of such an alternative programme. These forces must be concretely ready for mobilisation behind such an alternative. The concrete conditions for praxis in other words must exist; and in our view these conditions are rapidly ripening in the Indian context.

The early euphoria generated by talk of a 7-8 per cent growth rate after the 'marketist' economic reforms has vanished, the belief that the so-called withdrawal of the state would be followed by a less corrupt, less arbitrary, more rule-governed order has also vanished. In short the credibility of the new policy regime in the civil society at large has suffered greatly. At the same time there are very strong and unmistakable pressures from below for a betterment in living conditions, pressures that sometimes find outlets in the refracted form of 'lower caste' demands, and are often contained through so-called 'populist' measures. The fact, however, that even the ruling party which is committed to structural adjustment is forced to undertake these very 'populist' measures frowned upon by the Fund and the Bank, is indicative of the pressures from below for an improvement in living conditions (which does not of course nullify the observations about increasing poverty made earlier).

The only way these pressures can be met is if the basic classes, viz. the workers, both organised and unorganised, and the bulk of the peasantry, make the alternative programme into their own. If large DFI inflows are precluded, then the only means of improving the living conditions of the mass of the people is by tapping the existing reserves of the economy, i.e. by taking up the slack in agriculture through egalitarian land reforms as well as by more investment in rural infrastructure, and by raising the

domestic savings ratio as the East Asians and South East Asians have done. True, this appropriation of an alternative programme would take time, but the conditions for it are ripening.

We shall end with two comments. An essential component of any alternative programme over and above the mere nitty-gritty of an economic strategy must be a strengthening of democratic institutions and structures. Only then would its appropriation by the basic classes be a productive and more durable one. In other words, what is essential is not a new bout of social engineering, but a genuine process of social transformation which expands the direct political intervention capacity of the basic classes. Much has been written on the state versus market dichotomy, and much of it, as we have seen, is facile. If the state is not sufficiently accountable to civil society, then it has to be made accountable, but this cannot be ensured merely by a formal change in its character. Such a formal change has to be accompanied by a substantive expansion in the capacity for direct intervention on the part of the very classes in whose favour the formal change in the character of the state is supposed to have occurred. Putting it differently, the state versus market debate is a red herring which sidetracks the real debate: greater or lesser democracy for the broad masses of the people.

The second comment is the following: the fact that globalisation of finance has made the pursuit of progressive economic policies more difficult is obviously undeniable. But in focusing upon this phenomenon exclusively, we run the risk of missing the dialectics between the external and the internal, of completely ignoring the possibility of domestic mobilisation, of ignoring the effect of this mobilisation upon the ability to tackle the external constraints, in short, of ignoring the totality of the situation which defines the scope for praxis. Into the constitution of this totality, what enters is not only the changes occurring at the level of world capitalism, but also the level of political mobilisation of the masses domestically.

Notes

[This paper was presented at a workshop organised by the Economic Policy Institute, Washington DC, on October 21-22, 1995 on 'Globalisation and Progressive Economic Policies']

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India. The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth. Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

 - 28 Patnaik and Chandrasekhar, 'Exports, Investment and Growth', op cit.
 - 29 The argument that simply liberalising the economy, and thereby giving price incentives to the farmers, would cause a notable increase in agricultural output together with agricultural exports is an untenable one for reasons we have already discussed, namely that growth in agriculture is not a matter of prices alone, but requires substantial government investment in irrigation, extension etc, to which private investment then responds.
- Moreover even if for argument's sake it is accepted for a moment that higher prices would stimulate higher agricultural growth, since this growth under the extant agrarian structure would be under the aegis of the rich farmers, its effect on employment would be minimal: the elasticity of employment with respect to output in the new Green Revolution areas is very low and for the country as a whole has sharply declined. See Sheila Bhalla 'Trends in Employment in Indian Agriculture: Land and Asset Distribution', *Indian Journal of Agricultural Economics*, October-December 1987.
- 30 A detailed picture of the emerging resistance against the new policies can be found in Utsa Patnaik, 'Food Security: Class-Structure and Export Agriculture in Underdeveloped Countries and in India' paper presented to an International Conference on Agrarian Issues, Wageningen, The Netherlands, May 1995.

Conditions of Brick Workers in South Indian Village

A Dharmalingam

Brick workers in a Tamil village are so underpaid that it becomes difficult for them to reproduce even the labour expended. An increasing number of brick workers are taking to other areas of employment. The expanding brick industry also has had deleterious effects on the environment by felling trees for fuel, the consequences of which are felt more by the poor than the rich. The rich brick industrialists have distorted traditional social relations and widened the social distance between the 'haves' and the 'have-nots'.

IN recent decades the brick-making industry has expanded rapidly in southern Tamil Nadu. It appears that the benefits that accrued through this expansion have not been shared equally between 'capital' and 'labour'. In this paper brick work among men in a village in Tamil Nadu is analysed to understand its bearing on their lives and society. The quantitative and qualitative materials presented here were collected as part of a major survey conducted in 1987 by employing anthropological survey methods.¹

The study shows that the brick workers are underpaid, so much so that it becomes difficult to reproduce even the labour expended. With no hope for a better future an increasing number of brick workers are taking to other areas of employment. Further, the expanding brick industry has had a deleterious effect on the environment by felling trees for fuel. The consequences of this are again felt more by the poor than the rich. Most important, the newly-rich brick industrialists have distorted traditional social relations and intensified the tensions between the 'haves' and the 'have-nots'.

The expanding brick industry in the surroundings of the study village provide employment opportunities for the uneducated proletariat. The expansion of this industry began only recently. The number of brick kilns increased from two in the 1950s and 1960s to over a dozen in the 1970s and 1980s.

In the 1970s new kilns emerged to meet the increased internal and external demand for bricks. Internal demand was mainly from the emerging prosperous section of the population in the study area, and external demand for the bricks came from neighbouring Kerala state. The external demand was due to the high quality and lower price in the study area, which was the result of cheap labour and wood-fuel. The higher concentration of brick kilns was facilitated by good soil quality and secure water supply throughout the year.

The main area of concentration of brick kilns is at about two kilometres west of the study village, very close to the Western Ghats. Before the 1960s, the soil from the fertile garden land was used to make bricks.

But gradually, to meet the increased demand for bricks, new brick kilns were established in dry lands. At the time of the survey there were four brick kilns on the outskirts of the study village which had been dry lands before.

All the new industrialists are from the dominant peasant caste (Nadar) in the area. Many of them were either middle peasants or wage labourers. One leading industrialist and his wife were in fact brick workers before they embarked on large-scale production with little capital. Not all of those who started brick kilns, though, survived long. Some brick industrialists could not survive because of lack of capital when a loss occurred. Two small ex-brick industrialists in fact switched over to the stainless steel business in Kerala in which they seem to have done well; one reverted to his old tea shop occupation and another to his old tailoring job. All those who are out of the brick industry now are still in debt.

The brick industry, apart from creating employment for the proletariat, has produced some rich people in and near the study

village who were brick workers before. Though they were reported to have started the brick kiln with as little as 5,000 rupees capital, now two of the main brick industrialists own several millions worth of assets, and others a couple of lakhs worth. Reaping windfall profits was helped by two main factors. First, in the 1970s and early 1980s during which the new brick kilns were developing, their initial accumulation of capital was facilitated by lower fuel costs. Wood, which is the main fuel to bake the bricks and which formed a substantial proportion of the total cost of brick production, could be bought from peasants and others at a minimum cost in the beginning of the period of expansion of the brick industry. Many palm trees, which usually take about 50 to 75 years to grow to maturity, were cut for fuel, and their use by brick industrialists as a cheap fuel greatly helped the accumulation of capital. Second, the pauperisation of brick workers was the result of accumulation of wealth and resources in the hands of the industrialists. The wage

paid was usually barely enough to maintain the worker's family.

NATURE OF BRICK WORK

It is useful to start with a description of the process of brick-making for a better understanding of the nature of the work done and the wages received. First, earth is dug up; after the approximate quantity of earth required has been dug, water is poured on it to make it wet; the wet soil is then mixed well to be ready to make raw bricks. This part of the brick-making process can be called the 'soil preparation stage', this stage takes three to four hours, and both the main worker and the co-worker equally participate in it. In the second stage, a ground is prepared to lay the bricks on. After the surface is made even, a very thin layer of sand is spread to make sure that when the brick is laid it does not stick to the ground. The ground preparation is mostly done by the co-worker.

When the ground is prepared, the mixed soil is lifted to the ground by means of a wooden plate with two long handles on each side. The soil is usually mixed at a lower-level surface, normally in a pit that was created gradually as the soil was dug for brick-making; therefore lifting it to the ground is a hard job. Loads of mixed soil weighing about 100 kilograms are brought on the wooden plate to the ground by the main worker and co-worker together, one holding the front-handles and the other the back-handles. This is the hardest part of brick-making and is done for three to four hours every working day. The raw bricks are laid by both the workers, and this is usually done for four to five hours a day. If the co-worker is a young boy, only the main worker does the laying.

Laid-out raw bricks must be turned at least once to dry them well before they are ready for baking in the kiln. If both the workers are adults, turning the bricks is done by both; if the co-worker is a young boy or old man, he does the turning. The dried raw bricks are then stacked in such a manner that there are spaces between the bricks to facilitate the process of drying if they were not well-dried when they were stacked. The top of the stacks is covered with palm leaves to protect the dried raw bricks from rain. The workers' responsibility for making raw bricks ends with arranging the bricks in stacks.

In making raw bricks the workers have to expend a lot of energy. When they leave home for work, they take a heavy breakfast and also carry a heavy lunch box. Work starts around 7.30 in the morning and goes on till 6.30 in the evening. During this time the workers cannot afford to take any rest. Around 11 am they have tea and snacks (e.g. fried lentils or beans). Lunch is taken around 1.00 pm. Again at about 3 pm another round

of tea with snacks is taken, to sustain them until the end of that day's work. Workers say that eating four times is not at all sufficient to meet their energy demands. If they can afford it, they say, they can eat every hour while doing brick-work. At the end of the day they feel like corpses with no energy left. However, brick workers with no family responsibilities are very lavish in spending their wages on food items to keep their bodies fit to do the job.

The energy demand is such that only adults in the prime of life can do brick-work, particularly those between the ages of 15 and 50 years. Only adult men are engaged in brick-making in the study area, the work is considered too hard for women to do. Even among men only a few over 50 can do it. As can be seen from Table 1, only 6 per cent of the main workers and 4 per cent of the co-workers were aged more than 40 years. About 60 per cent of the main workers have worked over 10 years, and a similar proportion of co-workers have worked for less than 10 years. While some of the co-workers were aged under 15 years, all the main workers were over 15, which indicates

the physical development required to make a person fit for brick-making. Though it is necessary to work as a co-worker before becoming a main worker, not all can become co-workers before age 15. The co-worker stage is a necessary one to acquire the skills needed to make bricks. Co-workers under 15 are usually the main workers' sons or brothers.

In the beginning of the brick industry, all the main workers were under the control of, and accountable to, the brick industrialist. Lately there has been a new development, though insignificant in magnitude, in this relationship. This seems to be the result of increased assets and industry size. Under a new system the main workers have no connection with the employer but with a contractor. This puts the contractor rather than the industrialist in direct conflict with the workers. The co-worker is always under the main worker's control. However, if the co-worker is sincere with no intention of moving to other work or other industries, the employer encourages him to stay in his kiln by directly lending him money whenever needed.

All the brick workers in the study village were at the time of the survey working in about 13 brick kilns. There were some kilns in which no one from the study village worked. The brick industry can provide employment to a large number of adult males because of high attrition after the age of 40 years: the increased demand for bricks also encourages the employer to recruit new entrants. Though wages were determined according to the number of bricks made, a main worker might incur the wrath of the employer if he worked less than four days a week for no justifiable reason.

Brick work is available for eight to nine months depending on the duration of the monsoon. Raw bricks are not made during the three monsoon months in Tamil Nadu but during this period some men migrate to nearby Kerala state to work in the brick kilns there. (This is mostly illegal because unionism in the brick industry in Kerala is so strong that outsiders cannot get jobs easily and legally.) During the monsoon the brick workers are not unemployed because the monsoon creates employment in agriculture.

As mentioned above, the brick workers work for 11 to 12 hours every day. Only about 12 per cent of the main workers worked for about 10 hours a day; about one half of them for about 11 hours; and about one third for about 12 hours. A similar pattern is observed for the co-workers. This work is done for about five days a week and four weeks a month. Some workers work six days a week. Sunday is the rest day for all brick workers, and many of them go to a movie show on that day.

WAGES, LOSS AND OCCUPATIONAL HAZARDS

The wage for the main workers is determined by the number of bricks made, but for the co-workers the wage is fixed by the main worker on the basis of the capacity of the co-worker. The piece work rate paid by the employer varied between Rs 15 and 18 per 1 000 bricks. To earn a wage of Rs 15, a pair of main and co-workers have to make about 2 000 bricks a day. The average number of bricks made, depending on the strength of the workers, varied from 1 500 to 3 000 per day. Table 2 gives information on wages earned. About two thirds of the main workers earned a wage of between Rs 15 and 20 a day; about 15 per cent earned less than Rs 10 and a similar proportion of main workers earned about Rs 25 a day. It is common among the workers who earn over Rs 25 a day to work fewer days in a week than those who earn, say, less than Rs 20 a day. This is mainly because they are too tired to work many days; also they say they adjust to the heavy work by taking a day off. However, if they work for fewer than four days a week, they may face the anger of their employer.

Most workers earn between Rs 75 and 100 a week which will add up to about Rs 3,200 a year. However, allowance has to be made for the money spent at the workplace, which has to be met from the wage earned by the main worker. Every day on average about Rs 5 are spent on tea and snacks at the work site. Thus, if it is assumed that on average a pair of workers make bricks worth Rs 40, after deducting for the expenditure at the work site each worker would get about Rs 17. Most workers thus earn a net wage of only Rs 2,400 a year.

However, not all brick workers earn this much in a year because some may incur losses due to rain. The main brick worker is always in a precarious condition when the laid raw bricks are on the ground. Only when the bricks are arranged in stacks does the responsibility for the bricks pass from the worker to the brick kiln industrialist. If rain destroys the laid out bricks, then the main worker has to forgo his wage and his co-worker's wage together. In the study village there were seven main workers whose debt to the brick industrialist was due to brick loss in rain. As most brick workers take their wage before the work is done, loss due to rain increases their debt with the industrialist, which in turn affects their freedom to change occupation or move to another industry.

Over 70 per cent of the main workers were indebted to the brick industrialists at the time of the survey in 1987. As the wage earned is often insufficient to meet the cost involved in the maintenance of the family, workers are forced to borrow over their wage from the employers. Even on the days the workers are absent from work, usually two days a week, they have to borrow some pocket money from the employer, which adds to the gradual accumulation of debt with the employer. Table 2 shows that the average amount of debt was over Rs 600. As the majority of the indebted stated that borrowing was for the purpose of domestic expenditure essential for the survival of the family, it may be argued that the ever increasing affluence of the brick industrialists was at the cost of the workers' health and survival.

The conditions of the brick workers are worsened by their proneness to occupational injuries. The most often experienced accident was cutting the foot while mixing the soil with spades. Other occupational hazards include foot injuries caused by falling bricks. As Table 3 shows, of the 27 workers who experienced occupational injuries, about one fifth lost between six and 10 days of work, about half between two and four weeks of work, and about a fifth lost work for more than a month. Though 27 workers were injured at work, only four of them were paid some money towards medical expenses. Not even a small amount was paid to the injured for the period during which they were unable to work. Instead the workers' survival was maintained by lending them money. This is

another important reason for the indebtedness of the brick workers to the brick industrialists.

Another source of income loss to the workers, as mentioned above, was loss of work due to rain. The relevant information is given in Table 4. Here the actual work done has been lost because the bricks were destroyed by rain. Many workers were

subject to this – as many as 46 out of 51 main workers reported that they experienced brick loss due to rain. On average the workers have lost about Rs 400 worth of brick work during the reference year, which was the equivalent of about 15 days' work.

As the brick industry in the study area is considered to belong to the informal sector of the national economy, they are not bound by regulations governing working conditions and bonus. Two of the big brick industrialists give bonuses at the rate of Rs 10 to 20 for every Rs 1,000 wage earned. About 20 per cent were paid in such terms, about a quarter were paid bonus in kind (a dhoti and towel), and over one-half of the brick workers did not receive any bonus (Table 4).

With such an adverse working environment and life-long indebtedness to the employer, workers exploit all available means to prolong their survival. Paddy harvesting work is an agricultural activity every worker would like to do in order to earn some paddy. There are two paddy harvest seasons, one falling in the summer and the other in the monsoon season. As the paddy harvesting does not overlap with brick work in the monsoon season, the brick workers are free to go harvesting in that season. However, in the summer season not all workers are free to do harvesting because it will affect the brick work which in turn affects the interest of the brick industrialists.

Given the high social propensity⁴ for every one to do harvest work, only about 50 per cent of the brick workers participated in harvesting in both the seasons (Table 3), this indicates the role played by the brick employers in preventing the workers from participating. The strategies used by the employers to persuade the workers not to go harvesting, particularly in the summer season, can be mild or strong. In the mild version, the employer pays a lump sum in advance to the brick worker to buy the paddy that he would have earned through harvesting. As most workers are already indebted to the industrialist very few refuse to succumb to this pressure. If some workers are brave enough to challenge the industrialist, then he orders the worker to repay the debt before going harvesting. Four brick workers reported that they did not go harvesting in the summer season because their employers did not allow them. One worker reported that the brick-kiln owner did not allow him to do harvesting in both seasons because, he said, "I owed him a debt. The brick-kiln owner told me to take money from him to buy paddy and come to the kiln for work". Another worker said, "I went to harvest only once and for only a few days. Because we have borrowed from him, we have to dance to his tune. We do not have any other alternative, that is why we are working under him."

ALTERNATIVES TO BRICK MAKING

We have seen that an average brick worker earns a wage of between Rs 15 and 20 for his 12 hours hard work. He is not compensated for the work days lost through rain or occupational accidents. Even after working for 12 hours a day, he has to borrow from the brick-kiln owner to maintain himself and his family. Not willing to forgo the constant flow of profit, the brick-kiln owners prevent the workers from doing paddy harvesting which the workers consider crucial. By keeping the wage lower than the amount necessary for the maintenance of the worker's family and making the workers indebted, the brick-kiln industrialist makes sure that they are trapped into depending on them for life.⁴ Given the worsening conditions of life, it is not surprising that brick workers never miss any opportunity for alternative employment, though they have to repay the debt incurred to the brick industrialist before doing so.

Information about former brick workers is given in Table 5. There were about 38 persons in the study village who had done brick work in the past; most were aged less than 40 years and had worked for less than 10 years, which indicate that they did not see any future in brick work. Only one-quarter of the ex-brick workers left the job because they were not physically able to do the job, in contrast, about 70 per cent of them left because in spite of the hard and long work, the reward they received was not sufficient to meet the essential requirements of their families.

Aware of the destitute situation likely to result from work in a brick-kiln, many men now-a-days look for opportunities in petty trade, small business and petty services. About 25 persons in the village are engaged in such service occupations as tailoring, masonry work, tea shop and grocery shop. About 11 men do such petty trades as selling rice, vegetables, beedi leaves and tobacco. There were about four beedi-making small agents (locally called commission agents) and five brick-arranging contractors. Many men who are engaged in occupations which are different from brick work did so because brick work did not seem to promise them a better life.

The main sector in which many ex-brick workers have found employment is the retail sale of stainless steel utensils; 14 out of the 21 persons who do this business are ex-brick workers. This petty trade is done in the neighbouring state of Kerala. Two small ex-brick kiln owners bring the materials from Madras (about 600 kilometres north-east of the study village) and employ the capital-less ex-brick workers to sell the products in the rural areas of Kerala. Many large-scale stainless steel dealers from the villages near the study village conduct their business in

Kerala. People who sell stainless steel materials find that this job is easier and more rewarding than brick work – they can wear decent clothes while doing business, they have greater respect and higher status and they command more dowry if unmarried. While the big dealers became irritated with the strong trade union movement in Kerala, the ex-brick workers were impressed by the determination of workers in Kerala, some even wanted to organise the brick workers in the study village to fight for higher wages and good working conditions. As the stainless steel business is not affected by rain, it provides employment throughout the year, most businessmen visit their homes every three months.

It is therefore evident that brick work is increasingly disliked. The nature of brick work is such that a worker cannot depend on it forever, at some point he has to look for other jobs. To complement the existing employment opportunities outside agriculture and the brick industry, labourers with entrepreneurial skills move out to do business or work as petty traders. Some are even prepared to go to places as far away as Madras and Bombay. The factors that seem to play the determining role in out-migration are landlessness, poor wages and working conditions, and the absence of the prospect for a better future. An understanding of these conditions of existence is necessary in the study of individual behaviour.

SOCIAL EFFECTS

The expansion of the brick industry in a predominantly agrarian society such as the study village has not only reduced population pressure but also created an affluent minority, inter- and intra-family conflicts, and changes in the social fabric. The brick and beedi

industries⁶ have the potential to absorb the growing population in the study village but are not strong enough to retain them, because workers' labour is not rewarded well due to the existing power structure that favours the employer. This in turn makes the short- and long-term survival of the family uncertain. Employment is available for all but the wage is not enough for the development of the family, this is reflected in the high level of participation of capable adults and children in productive work and in the under-payment of wages and poor working conditions. At the same time, despite the meagre wage, the individual worker, whether female or male, is in a position to exercise some degree of independent choice, this positive aspect is however constrained by the poor material conditions of existence. To change this unpromising living environment, individuals make efforts and snatch any opportunity that comes their way, migrating out to do petty business in Kerala could be interpreted as one such response.

The expanding brick industry had both positive and negative effects on the environment, though there are more negatives than positives. On the positive side, as dryland soil used for brick-making, the land level is lowered. This lowered land could be brought under cultivation. However, when garden lands, and in some cases even wet paddy crop lands, are used for brick-making, cultivation is affected for five to ten years; sometimes, if the soil is very good, brick-making never stops. The main negative effect is the felling of trees for fuel in brick kilns. When the trees reach full size they are cut because they fetch a better price now than in the past. Sometimes even fruit bearing trees (e.g. tamarind) are sold to the brick-kiln, which was unthinkable in the past. The shortage of palm trees has increased the price of palm leaves which are used to thatch roofs. The poor being the main users of palm leaves, their interest had to be sacrificed for the benefit of the emerging brick industrialists. The demand for any kind of tree, including wild thorn trees, has reduced the availability of the free and cheaper trees for household fuel. This resulted in the opening of two wood-fuel shops in the village. The demand that these shops cater to was increased owing to the fact that both adult women and young girls are engaged in beedi-making, so there is no one, particularly young girls, available to collect fuel from the forest.

The newly acquired wealth of the brick industrialists seems to have had two noticeable effects on social relationships in the village. For example, two of the industrialists have married twice. Before getting into the business, each had only one wife, and they acquired second wives after establishing that they were wealthier. A third industrialist was taken to the police station

because of an illicit relationship with a girl, but the issue was reportedly resolved by bribing the police and the main parties involved in the dispute. As having an affair, or marrying a second wife while the first wife is alive and well, is against the local social values and customs; most people in the study village only pretend to respect these industrialists for their wealth and for providing employment.

Further, the rich industrialists have their own loyal followers who maintain their relative authority in the society. Whether it is a matter of the village council or the police station, the rich brick industrialists have a greater say in the outcome of an issue. With the implicit support of the brick industrialist, his loyal worker or servant can indulge in a clandestine affair with a girl and abandon her, to the disgrace of the girl and her family. When a verdict was given by the village elders or panchayat on the wrongdoing by the industrialist's thugs they could refuse to abide by it, which not only undermined the authority of a collective body but also disturbed the wider set of social relationships that govern communal harmony.

Summing up, it may be said that the economic and social changes that have taken place in the study village have facilitated expansion of employment, access to individual income, and increased individual independence. But at the same time the largely unchanged economic conditions of a growing section contrast with a flourishing minority section. The strength of the emerging class and

power structures, in turn, conditions the course of social and behavioural changes in the society.

Notes

- 1 For details see A Dharmalingam, 'Social Relations of Production and Fertility in a South Indian Village', unpublished PhD thesis, Department of Demography, The Australian National University, Canberra, 1991.
- 2 It requires at least two workers to make bricks - a main worker and a co-worker. Though most co-workers do the same amount of work as the main workers they are locally called 'helpers'. There are two major differences between the two workers. First, the co-worker can be a young boy or an adult, but the main worker cannot be a young boy. Secondly, only the main worker is accountable to the employer for the work done; the co-worker is accountable to the main worker.
- 3 Physically capable members of both poor and middle class families are, because of poor financial conditions, expected as well as forced to do harvesting because wage is paid in kind.
- 4 If a worker is indebted at the time of retirement, his family or sons are expected to pay the money back. If the amount is small then eventually the employer writes the debt off, if it is large, a deal is usually struck to pay part of the debt back.
- 5 Though the workers are conscious of their disadvantaged situation, they are not mobilised yet. Some attempts to bring the workers together in the recent past were thwarted by the brick industrialists.
- 6 Beedi work is discussed elsewhere, see A Dharmalingam, 'Female Beedi Workers in a South Indian Village', *Economic and Political Weekly*, July 3-10, 1992.

REVIEW OF WOMEN STUDIES

October 28, 1995

Growth with Social Justice

Sweet Slumber or Big Leap?

Bhupat M Desai

V S VYAS and Pradeep Bhargava in their paper, 'Public Intervention for Poverty Alleviation: An Overview' (*EPW*, October 14-21) have done eloquent service by not only commissioning nine state-specific studies on rural poverty but also by preparing a synthesised overview based on these studies. My comment is on their conclusion that poverty can be alleviated with the intervention of target-group specific poverty alleviation programme "without spectacular economic growth". This conclusion if extended to its logical extreme suggests that a strategy of poverty alleviation is a better alternative to growth with social justice-oriented policy. While Vyas and Bhargava may not have intended this, the unintended evil may be taken as good.

It is useful to consider three broad options for poverty alleviation. One, just the IRDP, JRY, etc. with moderate economic growth that Vyas and Bhargava seem to imply. Two, a higher rate of growth that is tilted in favour of agricultural-led process which is now widely documented as conducive to poverty alleviation. And three, such composition and rate of growth combined with selective poverty alleviation programmes.

Nowhere in the world has poverty declined to a tolerable limit without a high rate of growth, agricultural growth in particular. Unless there is large enough cake there is just not enough to share. This obvious lesson from historical experiences of the presently developed countries cannot be overlooked. And yet it has been overlooked perhaps because the authors found that poverty has declined in the face of deceleration in agricultural and industrial growth in 1980s in Andhra Pradesh for example. The logical extension of the analysis of this finding is what the authors seemed to have overlooked in their research. This extension is, would the poverty have reduced 'more' if the high-sectoral growth rates of 1970s in Andhra Pradesh were sustained and accelerated in 1980s?

Yet another reason for Vyas and Bhargava's conclusion could be that Kerala has reduced poverty despite low growth rate in the state. But the government of Kerala has been making frantic and concerted efforts to improve the state's growth lest reduced poverty becomes unsustainable.

If we extrapolate the lessons of the past studies on rural poverty, agricultural growth and growth in general one conclusion is loud and clear. And that is that poverty does reduce significantly and consistently (notwithstanding the importance of its fluctuations) with higher and more sustained growth and agricultural growth especially

[see for example, Mellor and Desai 1986, Ahluwalia 1986, Ninan 1994 and Gaiha 1995]. Punjab is an excellent case validating this. This is because not only is its poverty ratio the lowest in the country but the absolute number of rural poor living below poverty line has also declined in post-Green Revolution period. It is in this phase Punjab's agricultural growth accelerated with consequent structural transformation, diversification, and high employment and growth-inducing linkages of its economy [see for example, Bhalla et al 1990 and Shergill and Singh 1995]. It is thus disappointing that these deductions from some of the significant past studies have escaped Vyas and Bhargava. But may be not quite. This is because what they may have in view is a 'relative' (i.e., inequality in income/consumption expenditure distribution) rather than 'absolute' poverty reduction as an objective/value versus the choice for the

objective of growth. They may therefore prefer the former rather than latter.

But two important lessons on the nature of change in 'relative' poverty in the process of economic growth of the presently developed countries need consideration. One of these is that the 'relative' poverty does increase initially. And second is that this poverty diminishes as growth accelerates [see for example, Kuznets 1957]. The first lesson therefore forms the basis for poverty alleviation programmes. And the second forms the basis for the growth accelerating policies. In other words, it amounts to our earlier stated third option rather than what Vyas and Bhargava have implied.

If the authors' option of combining poverty alleviation with modest growth rate that can result from relatively higher non-agricultural growth and lower agricultural growth is exercised it would significantly accelerate demand for wage goods (foods and cotton textiles). This is because both poor and a large section of non-poor beneficiaries under this option would spend a large portion of their incremental income on these necessities. If this demand is not matched by the growth in the supply of these wage goods it would be highly inflationary with conse-

(2) Report on Currency and Finance, various issues, RBI

quent deterioration in poverty and growth. Moreover, it would be unsustainable also because of highly likely constraints of budgetary resources and foreign exchange. And it would also make the country vulnerable. Thus, no strategy of poverty alleviation can be successfully pursued without significantly higher agricultural-growth.

The third option of developing appropriate composition and rate of growth combined with selective poverty alleviation programmes at the policy level leaves much to be desired. As regards plan expenditure allocations for agriculture and rural development are concerned, there are three disconcerting features. One, their relative share for this sector in the total plan expenditure has been declining in recent Five Year Plans. Two, not only are these allocations smaller in these plans than in the past but actual plan expenditures are even lower than allocated. And three, these plan expenditures for 'production potential generation' have been lower and/or have smaller relative shares. The limitations of implementation of IRDP and PDS that constitute two major poverty alleviation programmes are quite well brought out by Vyas and Bhargava. Since the advent of new economic environment, the policies for agriculture are unsustainable, uncertain and lack a strategic focus. They seem to largely rely on improving terms of trade for agriculture through reducing protection to industries [Singh 1995] and more than warranted increases in procurement prices.

It seems the strategy underlying the preceding policies among other factors have given (a) lower overall growth rate, (b) lower sectoral growth rates, and (c) higher poverty in the post-reform years compared to immediately preceding five years or so in 1980s (see Tables 1 to 4).

Table 2 shows that the favourable terms of trade for agriculture have 'further' improved and yet agricultural growth in post-reform years is much lower. This is not surprising because aggregate agricultural supply response is known since long to be price-inelastic. This is because of resource specificity in agriculture, land supply being fixed, and lower input intensity. Table 2 also reveals that most of the major non-price factors (like HYVs, fertilisers, irrigation, electricity, government expenditures and institutional credit) which stimulate agricultural growth much more [see, for example, Dantwala 1962, 1967, 1978, and 1986, Mellor 1966 and 1976, Krishna 1982, Mellor and Desai 1986, and Thamarajshy 1994] have greatly deteriorated in the post-reform years.

The moot question now is, shall we wake up or be complacent about what Raj Krishna used to call Hindu rate of growth – yet another one though fortunately higher at 5 per cent compared to 3 per cent in his days? The answer could lead to sweet slumber or a big leap through a proactive policy for a higher agriculture-led growth rate combined with selective poverty alleviation programmes.

Incidentally, there seems to be general agreement that future agricultural growth

needs to be pitched up from 3 to 4 per cent targeted in past Five-Year Plans [see, for example, Vyas 1994]. Moreover, many of the poverty alleviation programmes are compatible with most agricultural growth policies. And they can be made more so with appropriate policy and programme-mix [see for example Desai 1994]. Maybe, we can draw lessons from the preceding to make a better choice between the two possible answers.

National Accounts Statistics of India - 2

Domestic Saving and Capital Formation

EPW Research Foundation

I

Basic Concepts

SAVING represents the excess of disposable income over expenditure on the final consumption of goods and services. At first remove, *saving* is thus considered as the balancing item on the income and outlay accounts of resident units after all of their current receipts and disbursements are taken account of [SNA 1968:130]. The concept emphasises the current nature of receipts and payments, thus ruling out the inclusion of flows out of past assets or future liabilities. Therefore, saving excludes capital gains and losses because they do not conceptually constitute part of the current disposable income; so is the case with capital transfers. The economic-theoretic concept of this income accepted for national income accounting purposes derives its basis, as referred to Part I, from the Hicksian notion of the "maintenance of capital intact", that is, treating income as the maximum amount that a household or other unit can afford to spend on consumption goods or services during the accounting period without having to finance its expenditures by dipping into its physical or financial assets or by increasing liabilities [SNA 1993:187].

At second remove, saving provides the link between the current flows in the system as appearing in the income and outlay accounts and the subsequent accumulation accounts. Accumulation is essentially a process of acquiring physical assets of a productive nature (gross investment or capital formation) or one of adding to financial assets; it also includes net acquisition of land and intangible assets like patents and copyrights. The sources of finance for accumulation are saving, provision set aside for the consumption of fixed capital, and the net incurrence of liabilities.

The most dominant and dynamic aspect of accumulation is *gross capital formation*, that is, gross additions to fixed assets and increases in stocks of commodities, during a period of account; such accumulation is made up of outlays of producing units on commodities which do not enter into the intermediate consumption of the same period. The basic distinction between intermediate consumption and gross capital formation is whether commodities are used up in the production process during a period of account

or whether they yield benefits in the future. The exception made to this otherwise fine distinction relates to intermediate consumption in the form of current outlays of producers for research and development or for advertisement expenses; this convention is adopted because such outlays are not embodied in tangible assets and the future benefits from such expenditures are uncertain [SNA 1968:110]. Non-reproducible tangible assets acquired such as land, mineral deposits, and the natural growth of standing timber or crops, are not included in gross capital formation. (Purchases and sales of land are considered to take place between residents only.) However, outlays on improving including reclamation of land, and developing or extending mining sites, timber tracts and plantations, are treated as part of capital formation.¹

Gross Fixed Capital Formation comprises fresh construction and acquisition of machinery and equipment (including transport equipment and breeding stock, draught animals, dairy cattle and the like). Construction for military purposes (other than construction or alteration of family dwellings for military personnel) and defence equipment are excluded from the scope of fixed capital formation. Destructive weapons are perceived as single-use goods and their actual use in combat to destroy lives or property cannot be construed as contributing to the production of goods or services. Similarly, military vehicles and equipment whose function is to release such weapons should not be treated as fixed assets. Some of the structures used in military establishments such as, airfields, docks, roads and hospitals are, however, often switched from military to civilian use. In the estimation procedure, some compromises and conventions have been adopted. Whereas structures such as military hospitals and the equipment contained therein are treated as fixed assets, weapons and their supporting systems are not. Likewise, capital outlays of defence enterprises on ordnance and clothing factories in India are included as part of fixed assets formation.

Another distinct area of exclusion relates to the acquisition of consumer durables like cars, refrigerators, airconditioners, television and video sets, musical instruments, and furniture by households; these do not constitute a part of fixed assets formation.

However, all consumer durables are not automatically excluded. Their classification as fixed assets or as final consumption goods depends upon the owner and the purpose for which they are put to use. If such durable goods (with durability of more than one year) are acquired and owned by producing enterprises for the use in production, or for business purposes generally, they are classified as fixed assets. If, on the other hand, they are acquired by households, the same are treated as having been used in final consumption. In the same vein incidentally, the consumer durables acquired by households do not constitute any part of their saving. Nor do valuables such as gold, silver, precious stones and other jewellery items or works of art, all of which are treated as constituting household final consumption expenditure.

Change in stocks refers to variations in inventories during the accounting period of materials and supplies, work-in-progress and finished products and goods in the possession of producers. Standing timber and crops are excluded from stocks, but logs and harvested crops are included. Increases in the stocks of defence materials stand excluded.

II

Steps in Estimation

As described in Part I, for the estimation of domestic saving and capital formation, the Indian economy is divided into three broad institutional sectors, namely, public sector, private corporate sector and household sector. The SNA 1993 defines an institutional unit as "an economic entity that is capable, in its own right, of owning assets, incurring liabilities and engaging in economic activities and in transactions with other entities" [SNA 1993:87]. Thus, these institutional sectors are conceived of as the centres of economic and financial decision-making. Their classification into three institutional categories mentioned above is guided by certain norms based on the motivations and social roles of individual entities, the needs of policy-making, the economic circumstances and institutional arrangements within the country and the availability of data. The household sector, for instance, has come to be recognised in the national accounts literature as the 'residual' sector embracing all economic entities other than the units of

public sector and private corporate sector essentially as a convenient way of clubbing together the left over or the unknown of all units. As this entire heterogeneous group ranging from individuals and farm and non-farm households to unincorporated enterprises is treated as one category (described in Part I) the K N Raj Working Group on Saving [RBI 1982] made a plea for undertaking estimation of saving and capital formation separately 'for farm households for unincorporated enterprises in industry transport trade etc. and for households proper' (p 49). For want of the requisite data the official agencies have not yet found it possible to implement this suggestion.

Be that as it may with the three sector categorisation of the economy the CSO has devised an ingenious way of estimation in which some components of saving and capital formation are common and interdependent. A few first principles in this estimation procedure may be noted. First as said above, the household sector is conceived as a residual sector in the entire framework of saving and capital formation estimation. From the global estimates of capital formation or financial asset holdings those for organised public sector and private corporate sector are deducted to arrive at the household share. Secondly household saving is used for accumulation either in the form of building physical assets or acquiring financial assets. The residual share of the household sector in gross capital formation is taken as identical to the household saving in physical assets, the other component of its saving being in the form of financial assets which is also separately estimated by the same residual method. This circuitous method is adopted because direct data on household saving, is almost impossible of arriving at on an annual basis essentially for want of household expenditure data that is data on household consumption expenditure or investment expenditure or on both. Finally the sources of data used in the estimation are varied and divergent so are the methods of estimation. As a result not only that various estimates may admittedly contain even large and indeterminate sources of errors, some set of aggregates based on one method do not match with another set based on some other method (or combination of methods). Therefore the official agencies could come to terms with the end product of certain key and consistent estimations only after making some informed judgement on the relative merit of one set of sources as against the other. Thus, its assumption that aggregate saving estimation is reasonably more reliable than the estimation of aggregate investment is to be appreciated in this light.

The basic steps involved in the CSO's estimation procedure as described by the Raj Working Group [RBI 1982] is as follows. First, aggregate gross domestic capital

formation (GDCF) is estimated for the economy as a whole for each year, separately for three forms of assets, namely construction machinery and equipment, and change of stock. Second, from the total of GDCF so estimated, the independently estimated amounts of gross investment of the public sector and the private corporate sector are deducted to derive the 'residual investment said to take place in the household sector. At the third stage the aggregate saving or the same as total finance available for investment is derived as the sum of domestic saving plus foreign saving (i.e. net capital inflow from abroad). Finally, though in principle estimates of GDCF and aggregate saving should match in practice, they do not. Impliedly assuming that estimates of aggregate saving (including net foreign capital inflows) are more reliable of the two, the difference which is described as 'errors and omissions' is adjusted in the original estimate of GDCF. It is this adjusted estimate of GDCF that is treated as the official estimation of aggregate gross investment in the domestic economy each year, though assetwise and sectorwise distributions of GDCF as estimated at the first two stages above continue to be based on the unadjusted series because there is no plausible way of distributing the 'errors and omissions' amongst assets or sectors.

An example based on concrete data for two sample years as depicted in Table A explaining the step-by-step estimation procedure is self explanatory. For instance aggregate saving was higher than the estimated GDCF by Rs 7 598 crore in 1990-91 and hence the GDCF was adjusted

upwards by that amount. In 1993-94, it was the other way about the GDCF had to be adjusted downwards by Rs 6 911 crore. But the assetwise and institutionwise distributions shown in Steps 1 and 2 in Table A remain unadjusted.

As the household sector saving in physical assets is common to both gross saving and investment estimates, the 'errors and omissions' referred to above essentially represent the difference between the estimates of investment in the "organised" segment of the economy (that is, public and private corporate sectors) and the investible funds available for that segment. Thus, for 1993-94 the investible funds available for the organised sectors in the form of their own saving net transfer of investible resources from the household sector (i.e. household financial savings) and inflow of foreign saving, aggregated Rs 1,16,372 crore and their gross investment was of the order of Rs 1,23,283 crore thus leaving behind a difference of Rs 6,911 crore equivalent to the estimated 'errors and omissions'.

It may be argued that any independent errors in the estimation of investment by the public and private corporate sectors should normally affect the size of 'errors and omissions' also. If, for instance, in 1993-94 the actual size of gross capital formation undertaken by the organised segment was higher than Rs 1,23,283 crore as estimated the implied arithmetic would bring about a corresponding reduction in the size of 'errors and omissions'. But in reality it need not be so because many of the possible sources of error in the estimation of organised sector investment would affect the estimation of

TABLE A STEPS IN ESTIMATION OF GROSS DOMESTIC SAVING AND CAPITAL FORMATION

	(Rupees crore)	
	1990-91	1993-94
Step 1		
1. GDCF by Assets (i+ii+iii)	1,37,391	1,67,553
(i) Construction	58,363	79,373
(ii) Machinery and equipment	65,641	85,006
(iii) Change of stocks	13,387	3,174
Step 2		
2. GDCF by Institute (a+b)	1,37,391	1,67,553
(a) Organised sectors (i+ii)	76,853	1,23,283
(i) Public sector	52,150	69,819
(ii) Private corporation sector	24,703	53,464
(b) Household sector (residual)	60,538	44,270
Step 3		
3. Aggregate Saving (A+B)	1,44,989	1,60,642
(A) Foreign capital inflow (net)	18,196	2,149
(B) Gross domestic saving (a+b)	1,26,793	1,58,493
(a) Organised sectors (i+ii)	19,879	33,097
(i) Public sector	5,436	1,941
(ii) Private corporate sector	14,443	31,153
(b) Household sector	1,06,914	1,25,396
(iii) Financial assets	44,376	81,120
(iv) Physical assets	60,538	44,270
Step 4		
1. Aggregate saving (Finance for investment)	1,44,989	1,60,642
2. GDCF (as estimated in step 1 or 2)	1,37,391	1,67,553
3. Errors and omissions	7,598	(-) 6,911
4. Adjusted GDCF (as in 1 or 2+3 in this step)	1,44,989	1,60,642

the sector's saving also symmetrically [RBI 1982 7-8] and hence they would have generally no effect on errors and omissions. Thus, when the proportion of expenditure going into capital formation in the public sector is overestimated, the resulting underestimation of consumption expenditure shows up in an equivalent increase in saving within the sector. Similarly, when the estimates of private corporate sector are based on samples of companies, the blowing up factors may give but limited asymmetric effects [RBI 1982 7].

III

Methodology and Data Sources – Key Elements

Gross Domestic Capital Formation (GDCF)

GDCF estimates are presented in three separate sets. Apart from those by type of assets and by institutional sectors, GDCF estimates are also presented by industry of use (agriculture, manufacturing, etc).

Of the three types of assets, assets created under construction and machinery and equipment constituting *gross fixed capital formation* (GFCF) are measured through the commodity flow method except for kutchha construction which is estimated using the expenditure approach. The commodity flow method envisages estimation of net availability of various commodities entering into fixed assets creation which is derived from production of commodities used in construction and of various items of machinery and equipment adjusted for uses elsewhere, changes in stocks, imports and exports. In construction, the value of all pure construction undertaken with the use of construction materials – five basic ones (cement, steel, timber, bricks and tiles and fixtures and fittings) and other materials is estimated by the commodity flow method. The value of kutchha labour intensive construction using the estimated expenditure figures is done separately for public, private corporate and household sectors, and in the household sector, estimates are also made for rural and urban residential buildings/houses, non-residential buildings and other construction works (i.e. various forms of land improvements, digging of wells and other irrigation sources, afforestation, etc). The RBI's decennial survey of AIDIS is the major source of data for this estimation. The expenditure on current repairs and maintenance of construction works is netted from their total value.

Similarly, various items of machinery and equipment domestically produced, imported, exported and re-exported are classified into (i) capital goods, (ii) parts of capital goods, (iii) partly capital goods and (iv) parts of partly capital goods. The total availability of the items classified under (i) is taken for

capital formation. In the case of parts of capital goods and other partial capital goods, on the basis of ASI data and details from users, estimated proportions of the value of each of them are taken as capital formation and the rest treated as intermediate consumption.

By Type of Institutions

Estimates of GDCF separately for construction, machinery and equipment and change in stocks for the public sector and private corporate sector are prepared by the expenditure approach on the basis of analysis of budget documents and annual reports of enterprises. These estimates of public and private corporate sectors by type of asset are subtracted from the corresponding aggregate estimates to arrive at the estimates for the household sector. Incidentally, the estimates of capital formation compiled by the RBI have been adopted in respect of the joint stock companies.

By Industry of Use

An independent set of estimates of gross fixed capital formation for each of the industrial categories such as agriculture, manufacturing and all other sectors are prepared primarily following the expenditure approach (the data sources being AIDIS and such other field survey results for informal sectors and ASI for registered manufacturing). The estimates of change in stocks on the other hand are prepared only by the industry of use based on similar data sources as explained below. These two estimates of GFCF and change in stocks are aggregated at the industry level to prepare the estimate of gross capital formation (GCF) by industry of use.

Change in Stocks

The estimates of change in stocks are estimated separately for public sector, private corporate sector and household sector within each industry of use based on data provided by the budget documents, annual reports and benchmark survey results carried backward and forward with appropriate current indicators. In the case of agricultural commodities, the stocks with producers are assumed to be negligible. The estimates of stocks of foodgrains with the private traders is estimated as equivalent to the difference between net availability and the estimated public consumption which is said to be on a weak foundation (Minhas and Kansal 1989).

Estimates at Constant Prices

Estimates of the value of output from construction at current prices are adjusted to obtain the corresponding constant price figures. Appropriate price indicators and deflators for different types of construction are specially prepared for the purpose. Similarly, separate indicators are used to obtain the constant price estimates for

machinery and equipment. These are also deflated separately for domestic production and net imports.

Domestic Saving

The CSO estimates of domestic saving are factored only at current prices though some private estimates have been attempted (see Roy Choudhury, Banerji 1990). On the recommendation of the Key Working Group, some revision in labour has been agreed to between the CSO and the RBI in saving and capital formation estimation so as to ensure uniformity in the use of methodology and data sources. Thus, the RBI is said to be responsible for the estimation of saving and capital formation in respect of the joint stock companies in the private sector and saving of households in almost all of the financial instrument.

Domestic saving is estimated sector wise for public and private corporate sectors (again based on their published accounts) and for the household sector. Its share in gross investment represents its saving in physical assets. The other component of household sector saving in the form of net financial assets (defined as increase in financial asset over the increase in financial liabilities) each year, this is also estimated by the residual method by deducting from the economy wide aggregate financial assets (net financial liabilities) the holding of financial assets (and liabilities) of the public and the private corporate sectors separately for each major group of financial assets and liabilities (for details see Table 5).

Public Sector

The gross saving of government administration in departmental enterprises is defined as the excess of current receipts over current expenditure. This is derived from the economic classification of the budgets of Central & State Governments and local bodies. The Issue Department of the RBI which is considered to be more akin to administrative activities of the Government is also included here. The gross saving of the non-departmental enterprises (except the LIC and the Issue Department of the RBI) is estimated from the results of the analysis of annual accounts of these companies and corporations. The gross saving is obtained as an aggregate of transfers of certain reserves, profits and retained earnings from profit & loss and appropriation accounts to the balance sheet, duly adjusted for expenditure/income relating to previous years. The gross saving of the Banking Department of the RBI is estimated as the sum of annual changes in various long term and stabilization funds established by the Bank (CSO 1989).

Private Corporate Sector

Based on RBI sample studies on company finances, the gross saving of public and

private limited companies in the private sector (including those of foreign controlled rupee companies) has been taken as equivalent to the retained profits (excluding non operating surplus/deficit) gross of depreciation provision. The blow up for both corporate sector saving and capital formation is the paid up capital series revised every five years by the Department of Company Affairs (Government of India) on the basis of its quinquennial census of companies.

Treatment of Retained Profits of Foreign Controlled Rupee Companies and Branches of Foreign Companies

As per the UN SNA 1968 the CSO has been treating the reinvested earnings of foreign controlled rupee companies and branches of foreign companies as part of corporate and in turn total domestic saving. Simultaneously the same have been treated as part of the outflow of property and entrepreneurial income to the rest of the world and in turn as part of the outflow of factor income abroad. However in recent years the RBI studies on company finances have not been covering branches of foreign companies for want of sufficient number of branches eligible for the studies (Rama Rao, 1990). As a result the retained earnings of branches of foreign companies are not being treated as part of factor income outflow (CSO 1985).

IV

Misgivings on Saving and Capital Formation Estimations

Amongst the estimations of various national accounts aggregates those of saving and capital formation have received maximum attention and also misgivings. In the early 1980s faced with a situation of high levels of saving and capital formation without being accompanied by a corresponding improvement in the growth momentum of the economy the Government of India appointed the Raj Working Group on Saving (RBI 1982) to undertake a critical review and interpretation of the available estimates and to recommend improvements. The Working Group identified many but indeterminate sources of errors in the estimations for different sectors as also in the aggregate. Expenditure leakages and over- or under- estimation of the costs of public sector projects, the blowing up factors in the estimation of private corporate sectors based on sample studies, absence of accounts of several private limited companies as also those of non-departmental undertakings on the government were identified as possible sources of errors in the saving and capital formation estimates of the public and private corporate sectors. Likewise in the aggregate estimation of GDCF various benchmark ratios of remote periods and current indirect indicators for extrapolation can be major

sources of error. These errors in the estimations of the aggregate GDCF and those for the organised sectors are carried over to the estimations for the household sector.

The Raj Working Group interpretations as well as recommendations came in for severe criticism (Rakshit, 1983) and when some of those recommendations were implemented by the CSO there were misgivings in regard to the tenability of the revised estimates (Roy Choudhury 1988). This particularly concerned the revised estimates of corporate sector savings and capital formation which affected the household savings, consumption of fixed capital (CFC) and the need for CFC provision for government buildings (See also a rebuttal of these questions in Gothoskar, 1988). A glaring discrepancy which is increasingly getting widened relates to the difference between the estimation of GDCF by type of assets and by industry of use (See Tables 9A and 9B). Because of the varying impact of price deflators the two alternative estimates differ rather significantly (Kansal 1992). There are also the influences of unreported incomes on saving and investment and those of the failure to use appropriate double deflation methods for gross output and inputs of various sectors other than agriculture (See Part I of this series).

Against the above background and against the perception that the recent sharp decline in savings, particularly household savings, does not match with the increases in GDP and agricultural growth in particular, the Government of India have again appointed an expert group to review the methodology for estimating saving and capital formation in the economy and to recommend improvements in it with particular emphasis on the estimations for household and private corporate sectors (RBI Annual Report 1994-95).

V

Key Features of Domestic Saving and Investment Behaviour

Relative stagnation in the gross domestic saving (GDS) to GDP ratio or a distinctly declining trend in the net domestic saving (NDS) to NDP ratio since the second-half of the 1970s followed by a sharp decline in public sector savings, an improvement in corporate sector saving over a low base and an improvement in household saving in net terms are some of the features of the saving behaviour during the past four decades and a half (Table 4A). Within the public sector rapid widening of dissavings by government administration and within the household sector, an uptrend in financial savings since the middle of the 1980s, are the other highlights (Table 4B). The structure of household saving has been undergoing a gentle change in favour of shares and debentures and against claims on government (small savings, etc.) (Table 5). The declining trend in the share

of bank deposits seems to have been arrested in the 1990s.

There has occurred a distinct decline in the ratio of gross capital formation (GCF) to GDP ratio since the beginning of the 1970s which is partly corroborated by (a) a sharp fall in net foreign capital inflow, and (b) a significant decline in change in stock. There has been a relatively higher rise in the prices of capital goods than in the general price level in the 1980s as evidenced by the behaviour of GCF to GDP ratios at current and constant prices (Tables 6A and 6B). While the ratio of fixed assets formation in the form of 'construction' has reasonably stood the ground since the beginning of the 1990s it is the 'machinery and equipment' segment of the fixed assets formation that has tended to decline, particularly in the household sector (Tables 7A, 7B and 8).

In GCF by industry-of-use while the rate of investment in agriculture has suffered that of manufacturing, particularly of registered manufacturing has remained firm (Tables 9A and 9B).

Notes

- 1 This note has relied heavily on definitions and descriptions contained in CSO (1980), CSO (1989), SNA 1968 and SNA 1993.
- 2 There is a minor inconsistency created in the two publications CSO (1987) and CSO (1989). While the former has revealed the exclusion of the retained earnings of the branches of foreign companies from net factor outflow, the latter continued to state that net factor income from abroad included such retained earnings.

Rupees (core)

Information within parentheses "A" represents percentage to Gross Domestic Product at current market prices and "B" represents percentage to Gross Financial Assets/Liabilities

* Bank deposits includes deposits with banks co-operative banks and societies and also compulsory deposits with RBI under compulsory deposits (additional emoluments and income tax payers) schemes, 1974. Loans to companies includes deposits with non banking companies. % Insurance funds includes state governments and postal insurance funds. @ Shares and debentures include those of private corporate business co-operative banks and societies bonds of public sector undertakings and mutual funds other than LTI. \$ Other assets represents net positions in trade transactions with private companies and state electricity boards and is equal to other assets minus other liabilities if any. # Bank advances includes bank advances and loans and advances from co-operative non credit societies. Trade left/credit are adjusted in other assets and accordingly, the gross having liabilities are adjusted. In the RBI data other assets are included under bank deposits.

THE TNPL ISSUE

ISSUE OPENS ON 27TH NOV, 1995

**Public Issue of 2 crore Equity Shares of
Rs. 10/- each for cash at a premium of
Rs. 100/- per share aggregating Rs. 220 crores**

**Rs. 30 - only
per share on
Application**

HIGHLIGHTS

- First commercially successful Integrated Newsprint Mill in the World with bagasse (sugar cane waste) as the primary raw material. Applicable for India which is one of the World's largest sugarcane production and facing dwindling forest cover.
- Highest Gross Profit Margin and Net Profit Margin amongst large paper mills in the country Ranked Number One in Average Profitability and Number Two in Net Profit among Indian Paper Companies by Centre for Monitoring Indian Economy.
- Consistently high capacity utilisation. Average Utilisation of 101% in the last 5 years.
- Cooked and different quality products indicated by year-end zero stock of finished products for the past six consecutive years.
- Rated AAAA (Highest Credit Rating) by CRIISIL for Fixed Deposits.
- Currently one of the largest paper mills in the country producing 30L Tons of Newsprint/Paper and is now implementing a project for doubling of capacity to 600 Tpd.
- World Bank supported project. World Bank Loan of US\$ 75 million for the Expansion. Expansion Project approved and funded by IDBI.
- Expansion Project in an advanced stage of implementation. Commercial Production scheduled for January 1996.
- Flexibility to shift Product mix between Newsprint and Printing and Writing Papers depending upon market situation.
- Raw Material available in plenty and the Company has a unique arrangement with sugar mills for assured supply of bagasse.
- First paper mill to introduce Pink and High Bright Newsprint in the country.
- Company also exports Printing and Writing Paper to Egypt, Dubai, Singapore, Jordan, Malaysia, Nigeria and other countries.

Note: Investors are advised to refer to the Para on "Justification of Premium" before investment in the Issue.

RISK FACTORS

- Removal of quota restriction on import of Newsprint and reduction in customs tariff on import of Printing and Writing Paper may make imports more attractive if international prices come down. Currently international prices are about the same as domestic prices for Newsprint of comparable quality and higher than domestic prices for Printing and Writing Paper. Also, the company has the flexibility to shift its product mix depending upon the market situation.
- Loans and advances as on March 31, 1995 include a sum of Rs. 9.31 crores (representing principal of Rs. 8.28 crores and interest and other charges of Rs. 1.03 crores) due from ABFSL. Interest on funds placed has not been recognised

as income from 1st April 1993. Against these dues the Company's possession of FIREC Bonds of face value Rs. 2.00 crores received from ABFSL. Legal suit has been filed against ABFSL for recovery of the principal and interest/other charges thereon.

- The loan from the World Bank for the expansion project is out of a basket of currencies and the Company is exposed to the risk of foreign exchange fluctuation on the same. The risk will be hedged to the extent of exports made by the Company.
- Some appeals have been filed by the Revenue Department before Madras High Court on orders made by lower courts for enhancing compensation payable for land acquisition. Any higher compensation awarded by the High Court is payable by TNPL as the Requisitioning Body. The liability that may arise on this account is estimated by the Company at about Rs. 97.21 lakhs.
- A demand of Rs. 3.68 crores has been raised by Central Excise Department for delay in submission of RNI authorisations to various Assistant Collectors. The delay was on account of practical difficulties in submission of authorisations to ACs scattered all over the country. Recognising the difficulty GOI has subsequently modified the requirements. The Company has filed a writ petition before the Madras High Court against the above demand which has passed an interim stay against collection of duty.
- An appeal has been filed before the Commissioner of Income Tax (Appeals) against a demand of Rs. 7.31 crores for AY 1992-93 which arose due to disallowance of set off of carry forward losses against interest on surplus funds change in the method of valuation of inventories and few other items. The Company has been advised that the return filed by it is supported by past judgements and well established principles. The appeal is yet to come up for

hearing. The Commissioner has passed orders for staying the collection till the disposal of the appeal or 31.12.95 whichever is earlier.

- Certain claims from customs authorities amounting to Rs. 1.54 crores have been disputed and shown as claims against the Company not acknowledged as debts.

If the Company does not receive the Minimum Subscription equivalent to 40% of the issue including devolvement on Underwriters within 60 days from the date of closure of the issue, the Company shall forthwith refund the entire subscription amount received for delay beyond 75 days. If any refund of subscription, the Company shall pay interest as per Section 73 of the Companies Act, 1956.

New India is one of the first fully
Indian insurance companies.
Since its inception 75 years ago, New

India has remained firm in its pledge to
offer security and support to the people
of India.

Over the years, New India has offered
a range of pathbreaking insurance covers.
From cancer, mediclaim and birthright

(unborn child welfare). To low premium
personal accident policies for farmers.
And cash compensation for the
underprivileged in the event of
accidental death of sole breadwinner.

These insurance covers from New
India are helping make life a lot more
secure. Physically and emotionally.

No wonder, New India remains India's
leading general insurance company.

Vol XXX No 48

Commodity Exports

A basic apprehension regarding the policy of promoting exports of agricultural products is its impact on food security, in particular on domestic food prices. This concern becomes important in the light of the evidence of the weak supply response of agricultural production. The experience of tea suggests that a policy of export of agricultural commodities, particularly essential commodities cannot be recommended without caution.

3070

Rehabilitating Socialist Alternative

The significance of the revolutionary upheavals of 1989 and its aftermath in the former second world cannot be minimised. Disillusionment about the desirability and feasibility of a socialist alternative has never been greater. What is required today is the rehabilitation of the very idea of the possibility and the necessity of a socialist alternative itself. What are the goals, concepts, methods, practices and models that we must preserve?

3075

Biotech Blues

The department of biotechnology, set up a decade ago to help Indian expertise to move into the mainstream of an emerging new field, is stagnating.

3049

Insights into Kerala Model

Sri Lanka shares with Kerala the achievement of remarkably good social indicators, made in the context of slow economic growth. While there are differences in the political economy of the two regions, a significant commonality is the presence of marxist/radical parties in mainstream politics.

3085

Alcohol and State Excise

Can governments reduce their financial dependence on taxes on alcohol so as to improve the overall health, efficiency and productivity of labour and the general welfare of the people? Pattern of excise revenue from alcohol in southern states.

3051

Wedding as Politics

With but a few months to go for the general election, the AIADMK was, through the mammoth wedding which made such big news, beaming a few strategic signals to its faithful folk and to its political opponents.

3053

Voters' Choice

In the last decade voters in Latin American countries have tended to vote for responsive leaders who can provide instant solutions to pressing problems, no matter the nature of governance.

3059

Landmines and Laser Weapons

India needs to take a keener interest and fight with greater clarity on the menace of landmines that he scattered over the globe, and the use of laser weapons for blinding soldiers and civilians.

3047

Baltic Rejuvenation

If the future of the world belongs to small states, then the three newly-independent Baltic countries, Estonia, Latvia and Lithuania, herald the new world order. Despite the severe slump they experienced as a result of the break-up of the Soviet Union, the three countries have today gone a long way in restructuring their economies.

3062

Development and Resettlement

The national policy for resettlement and rehabilitation continues to view displacement only as an appendix. What is needed is a policy which places displacement in the context of the development process and deals with the problems that arise.

3055

Consumption Expenditure

The CSO estimates on the distribution of private final consumption expenditure by major items of consumption show some interesting features. National accounts statements on the transactions of the public sector show the sector's share in the respective economywide aggregates.

3095

Political Intrigue

SANJIB BARUAH's Western Cultural Boundary of Assam (November 4) sets out on an intrepid journey with a breath taking historical howler and arrives at a destination much in favour with bureaucrats of the home ministry in New Delhi. Instead of promoting structural changes in the economy of this neglected state New Delhi has helped maintain the old colonial pattern in a new guise with the people of the state importing from the rest of India most of the goods in daily use including essential food articles and sullenly witnessing the spoliation of the natural resources of the state by metropolitan industry and trade. No wonder there is seething discontent and unrest among different sections of the population. Since foreign and Indian big capital have no intention of abandoning their right to plunder they tackle this problem by fomenting discord among the different local communities and dismembering the state into smaller and smaller units. All in the name of the right of self determination!

Without industrialisation Assam can scarcely solve the myriad problems that follow from prolonged underdevelopment. It is here that in spite of raucous publicity the government has failed dismally. And western Assam is the part of the state that has suffered most in recent decades from the burden of underdevelopment. Various militant ethnic movements are already on the boil in this part of the state. As usual, instead of addressing the fundamental problem the government of India seems to be thinking of creating a new state out of parts of western Assam and north Bengal. The process of nationality formation in Assam already slowed down and hindered by such underdevelopment, is bound to suffer a serious setback if that vile scheme is carried through.

As a matter of fact people of western Assam speak a dialect of Assamese. It differs from standard Assamese but there are definite links with both standard Assamese and other Assamese dialects. In fact Assamese literature was born here in the 14th century under the patronage of the kings of Kamata, a kingdom that claimed descent from ancient Kamarupa. Kamata covered parts of western Assam and northern Bengal. For the record it must be said that

the people of Assam feel a cultural affinity with north Bengal that people from the rest of Bengal are unlikely to feel even today. When the SRC was re-demarcating state boundaries there was a strong groundswell of opinion in Assam demanding incorporation of Cooch-Bihar with Assam.

The great scholar of Assamese language Banikanta Kakoti was actually referring to the birth of a distinctive Assamese literature in Kamata long before Sankardev, and the quotation from his work refers precisely to that and not to Sankardev's contribution. In fact Sankardev in his literary works makes it clear that he is following in the footsteps of other writers. Barua fails to understand that not only out of ignorance but in his blind urge to support the GOI intrigues against Assam. Incidentally GOI is funding research to prove and promote independence of the west Assamese dialect so as to create a separate state there!

Data on Minorities

WHILE welcoming the UNDP Report 1995 which included gender-related development

and empowerment index, the Minorities Council of India urges the UN to undertake the study and analysis of the share of minorities in economic progress in national development of each country. Publication of such data will help in initiating action by states under law and policy programmes envisaged in Article 4(5) and 5(1) and (2) of the UN Declaration on Persons Belonging to Minorities (December 18, 1992) ensuring their participation in economic progress in national development.

We have also asked the UN to observe December 18, on which UN Declaration on Minorities was adopted as the Minorities Day, and to declare 1996 and 1997 as the year of the minorities so that attention of the world community may be focused on the condition of minorities in each country in terms of their security of life and property and in terms of their development and identity rights. We specially appeal to political parties, NGOs and human rights groups in the SAARC countries to make similar appeal to their respective governments and to the UN.

Forgotten People

FOR the victims of the Bhopal gas disaster, each passing year brings more evidence of the systematic efforts being made to erase their histories. The story began soon after the gas leak, but it was the Indian government's decision in 1989 on the settlement arrived at with unseemly haste that made intimate the process of obliteration. The following October the Supreme Court upheld the decision and pronounced the settlement amount as adequate. The fact that this amount was allocated on the basis of inadequate data—for less than half the victims had been medically examined and only a fraction of the death claims processed—was set aside ostensibly in the interest of bringing relief to victims. The death toll according to official figures available with the directorate of claims is now over 1,500, more than double the number for which compensation was worked out at the time of the settlement. But even this represents only a proportion of the deaths—the directorate has rejected over 43 per cent of the claims on what activists have reported as being flimsy grounds.

Over 597,000 people have claimed that they have been injured by the gas leak. This ironically enough excludes the 1,50,000 young adults who were under 18 years of age at the time of the disaster. This despite the fact that the Supreme Court order on interim relief acknowledges the right of minors to compensation. In other words a whole generation has been, in a sense, wiped out of existence as far as the state and the courts are concerned.

The situation among those who are legitimately allowed to file claims for compensation is no better. Corruption is rampant at every level. And worse, once a compensation amount has been decided upon by the court, there is no way the victim can seek a revision. For, once the claim has been processed the interim relief ceases and is not restored when a review application is submitted. All other rehabilitation activity in Bhopal has ceased. Of the 152 sheds built at great cost for setting up industries which were to provide employment exclusively to the victims, more than 50 have now been converted into barracks for the Rapid Action Force and not a single industrial unit employs gas victims. All but one of the 30 odd workshops built for women victims soon after the disaster have closed down. The sole remaining unit is a stationery production centre which is open only because of the determined fight put up by the women, who have formed a union.

Perhaps the most telling illustration of the sustained effort to obliterate the disaster from all record, is the termination of the more than 30 ICMR research studies most with a long term objective of monitoring various indicators of health damage. In years to come, there will not be, even in medical literature, data on the multiple effects of the gas disaster. Meanwhile

victims continue to throng Bhopal's four hospitals meant for survivors. There are over 4,000 out-patients every day. While there are plans to set up two more hospitals, the medicare allocations have come down by 25 per cent. With little follow-up or community based services, patients tend to alternate between government hospitals and private practitioners ending up over dosing themselves.

It is in this situation that the so-called Bhopal Gas Hospital Trust, set up by the Union Carbide Company (UCC) has proposed the setting up of a specialist hospital. To the victims and to those who have worked in Bhopal the proposition is ridiculous. For one thing, there is a grave lack of information on treatment procedures—the UCC has chosen not to part with medical and toxicological information on the leak phases. Moreover, without an efficient primary and tertiary level medicare base, the specialist hospital cannot function with any degree of specialisation. And thirdly, according to reports, the site picked for the hospital is way outside Bhopal, ideal perhaps for a sophisticated superspecialty institution, but not for the victims who live miles away in the gas-affected areas.

This proposal in fact, constitutes the last act in the well-orchestrated campaign to permanently erase the gas disaster in Bhopal from public and corporate memory. It was on a plea made by the trust that the Supreme Court decreed it fit to revise its own earlier order and of its lower court to allow the trust to have access to Rs 60 crore of the amount realised by the sale of shares attached by the chief judicial magistrate, Bhopal in 1992, in a criminal case against the company and its chief office holders. It expressed confidence that the hospital project, now being executed with the full support of the central government's concerned departments, would be completed in three years. Yet it is a fact that at no point has a detailed plan of action or a programme for the hospital been submitted. The hospital trust has now petitioned the Supreme Court for the release of a further amount from the frozen securities. It has also made a plea that the criminal case against the company be dropped because it would affect the realisation of a good price for the securities in the international market.

Victims groups, it may be recalled, had even earlier protested the very setting up of the trust by UCC pointing out that the trust came into being only in March after UCC had been declared an absconder in the criminal case against it. The trust, they argued, was merely a ploy to refurbish the image of UCC and a pretext to dispose of the attached assets of the company and to continue to remain out of the reach of Indian courts. Judging by the reported and unreported activities of the trust, in attempting to seek alliances with victims groups, to seek concessions from the government etc., it would seem that the

victims' fears were not unfounded. It is clear that if Bhopal is not to happen again ever anywhere, then there has to be an apportioning of blame, reckoning of the burden of guilt and recompense to the victims.

At a practical level, it is the UCC which holds the information necessary to fully assess the nature and type of damage to the survivors. Moreover, there are other issues like the ground and environmental contamination that have occurred and which will continue to affect those who live in the area unless something is done to identify the toxic material, to neutralise and control its spread. All of this requires the co-operation of the company which produced the hazard in the first place. It is not, however, a matter of access to information alone. The gruesome disaster in Bhopal was a criminal act of negligence by a multinational and was compounded by the devastating grip that the company has had on the state and its agencies. In the emerging ethos of liberalisation, multinational all over will have longer reach than before in third world countries. In such circumstances, to let UCC go scot free by withdrawing the criminal case against it would be an invitation to even worse disasters in developing countries.

BSE RIL AFFAIR

Mud All Round

The squabble between the Bombay Stock Exchange (BSE) and Reliance Industries has drawn predominantly cynical responses. Underlindably, this is tantamount to pre-fighting a group on the other in the gang war that is known to have been raging in the city of Bombay. From a broader societal consideration, there is a parallel between the two in that both the types of gang wars are taking place right under the nose of the authorities. In fact, the street level gangs and the apparently more sophisticated BSE RIL types of gangs have been nurtured by a so-called political system which thrives on money power. For the BSE, it has been shown up time and again to be a den of speculation and corruption. It has consistently opposed all effort by the authorities and the Securities and Exchange Board of India (SEBI) to reform the capital market and to introduce modern practices in share trading. Stopping of trading on one pretext or the other such as payment of fees to the SEBI and its constitution of the stock exchange's board, concerted attempts to get the erstwhile chairman of SEBI, C. V. Ramakrishna, out of the way because he sought effective reforms including banning forward trading and finally its success in getting the decision to restart forward trading—all these have been sufficiently chronicled. Even the issue of duplicate share certificates fraudulently by companies is not new. Many companies have been resorting to such certificates for hypothecation with banks and financial

institutions and the BSE has remained silent about it. Instead of compelling the BSE board to fall in line with the capital market reforms, the authorities have resorted to the circuitous route of offering competition to it in the form of the National Stock Exchange of India (NSE). In the same way, however spectacular may have been its growth, the history of Reliance Industries has been a sordid one of manipulation of government regulations on an unprecedented scale. The issue of 15 lakh duplicate shares of which 8.70 lakh were to the Unit Trust of India (UTI) and the rest largely to RIL's investment subsidiaries and associates is of a piece with this, though the amount involved may be small compared with the much larger cases of alleged excise duty evasion, ante-dated letters of credit and now corporate tax avoidance with zero-tax status conferred on itself for the past 25 years since its inception.

If the BSE has suddenly woken up to the rules of the game and seen omission and negligence on the part of the company [RIL] and its transfer agents, Reliance Consultancy Services (RCS) and accordingly chooses to suspend trading in RIL shares for three days, there has to be more to it than meets the eye. There is evidently bitter rivalry among stock brokers who are divided on pro and anti RIL lines. But at least two cases of share switching and fraudulent issue of duplicate shares have come to light. First, one Rajul Vasa (physiotherapist of Dhirubhai Ambani) and Gajendra Vasa apparently collected cash from a broker for RIL shares and then applied for and obtained 26,650 duplicate shares on the ground that the original shares had been lost; these duplicate shares were also transferred to third parties. The second instance is that of the switching of 8.7 lakh RIL shares purchased by the UTI as long back as in December 1991. The UTI has admitted in a press release that among the 15 lakh shares of RIL restrained by the special court (of justice R.N. Varma appointed after the 1992 financial scam) from being registered and transferred and hence declared bad delivery by the BSE, 8.70 lakh shares held by the UTI were included. The UTI says that it purchased these shares from the secondary markets in December 1991 but the shares returned to the UTI's custodians, the Stock Holding Corporation of India (SHCIL) and Citibank NA, were different from the ones lodged with RIL's registrars for registration. This had apparently been noticed by the UTI only in January this year, what is more, the UTI took another 11 months to get it rectified in November after Fairgrowth Financial Services (FFSI) filed a petition with the justice Varma court. RIL promptly replaced the lot of 8.70 lakh shares within a week of the BSF declaring the whole lot of 15 lakh shares as bad delivery. The subsequent developments with the Ambanis serving notice on the BSE to terminate the listing agreements of the RIL and three other group companies, the massive inspired trading in RIL scrips on the NSE a

day thereafter at higher prices and the general adverse reaction from domestic and foreign investors and the resultant uncertainties in the capital market are well known.

The BSE RIL street-fight has exposed the richest corporate giant and the largest stock exchange in the country in a way that the operation of the whole capital market has come into disrepute with the investing public. But what is sadder is that the images of three other institutions, namely the SEBI, the NSE and the UTI have been tarnished jeopardising hopes of functioning of the stock exchanges on healthy lines. The SEBI as a body responsible for the development and regulation of the securities markets and for investor protection has failed to bring to bear its statutory powers and moral authority to ensure strict action which could have set a precedent for the future. SEBI has been receiving a massive number of investor complaints with RIL generally topping with the largest number of complaints, which it faithfully records and publishes, but does nothing about. SEBI's initial wavering and the ultimate giving in to the dictates of the finance ministry on every major issue, such as allowing forward trading, now the enquiry into the malpractices in the BSE RIL imbroglio and in particular the switching of shares with the UTI have become commonplace.

SEBI's failure has become all the more apparent when the NSE welcomed the Ambanis' decision to treat the national stock exchange as a regional exchange for trading in RIL and group company shares. NSE preened itself because, with the large corporate body preferring it for trading in its shares, it would top the list of stock exchange in the country. There was an astonishing 8 percent jump in the screen-based NSF trading within a day from Rs 176 crore to Rs 320 crore in RIL shares which was clearly inspired by the company's desire to pressurise the BSE. Of that total turnover of Rs 568 crore on the NSF on the relevant day, Rs 322 crore (57 per cent) was attributable to RIL shares at a price of Rs 227 per share as against Rs 206 on the previous day. In a healthy market it would not have been possible to deploy such huge funds at one go without attracting the attention of the regulatory authorities as well as the tax authorities, but not an eyebrow was raised. Obviously the NSF took a narrow view of the episode, ignoring its larger mandate of helping to evolve healthy practices amongst member companies on exchanges. Stock exchanges have a collective responsibility and misdemeanours of a company noted by one stock exchange cannot be condoned by another.

The UTI too has come out poorly from the whole episode. Its administrative structure seems to be ill-equipped to handle the avalanche of investor complaints. The episode of the Mastergain units that was suspended from trading clearly indicates this. Even in the present case of 8.70 lakh RIL shares, it is intriguing that it had had no

nkling of the switching of shares until January this year. The UTI's claim that the matter had been under its active consideration all along does not carry conviction. And, interestingly, the company which had been dragging its feet for so long, suddenly replaced the whole lot of 8.70 lakh shares once the special court froze transfers in the 15 lakh RIL shares and it became known that the UTI holdings were part of them. The UTI's massive bulk purchase of the RIL shares on private placement has now been revealed to be worth Rs 1,080 crore, on which the UTI has lost Rs 400 crore so far. What had been known so far was the purchase of a block of over 20 lakh shares under the private placement at a price of Rs 385, Rs 7 higher than the market price, involving an investment of Rs 773 crore, on which there had been an erosion of Rs 290 crore in value. It has been now revealed that this had been the second private placement, the first one having been that of 16 per cent non-convertible debentures (NCDs) with warrants attached. The warrants, numbering nearly 75 lakh, were compulsorily exercisable at a price of Rs 401 per share between October 1994 and March 1995; the UTI exercised the warrants on March 10, 1995. With a market price of Rs 240, the erosion in investment amounted to another Rs 125 crore. Was this a simple case of failure of commercial judgment?

All told, there is a strong case for a comprehensive commission of enquiry into the different aspects of the BSE-RIL affair which clearly has major implications for the development of the capital market on sound lines.

DALIT CHRISTIANS

Victims of Injustice

THE step of the Catholic Bishops Conference in India (CBCI), National Council of Churches of India (NCCI) and All India United Christians Movement for Equal Rights (AIUCMER) to issue an directive to close all Christians educational institutions on November 21 to express solidarity with the cause of the dalit Christians is not as benign as it appears. The dalit Christians, especially of the catholic sect, have been agitating for long against the caste discrimination practised within their community and the church. They have been demanding the extension of constitutional privileges allotted to the SC and the ST communities belonging to Hindu, Sikh and Buddhist fold. But till late, the bishops rarely evinced interest in the issue despite the fact that the National Convention of Catholics held in Bombay in 1989 had declared 1990s as 'the decade of dalit Christians'. The growing assertion of the dalit Christians in the post-Mandal period on one hand, and the favourable response shown by the Congress in the election year to their demands on the other, has goaded the higher echelons within the church to openly espouse the cause of the dalit Christians.

The argument of the church establishment that it lacks resources for the upliftment of the dalits and hence has to demand reservations does not ring true. Moreover, to castigate the Indian government for practising a 'policy of apartheid' *vis-a-vis* dalit Christians does not go beyond rhetoric. By forwarding such arguments the catholic church is evading its responsibility in accepting its failure to eliminate casteism within its fold. Today, dalits form only 3 per cent of its clergy. Only three out of 125 bishops in the country hail from dalit background while merely 2 per cent of dalit Christians have secured college education.

This dismal state is even more true for dalits within the catholic sect. Dalits who opted for the protestant sect, the American mission or the seventh day adventist sect form a substantial portion of their clergy. These dalits were aided by the fact that hardly any caste Hindus got converted to these sects. Thus, the problem of casteism was mitigated. Even after 100 years the missionary schools for dalits in Ahmednagar district of Maharashtra teach up to 7th standard. This automatically eliminates any chances of dalits becoming priests since a 10th standard qualification is required for the priesthood. Converts from brahmin and kshatriya communities of Goa and Kerala usurp all the benefits of missionary institutions while converted dalits work as gardeners, attendants and sweepers. Dalits are denied access to missionary hospitals and schools, and in some instances, to churches. Catholic brahmin clergy even opened a technical school in Pune forwarding the cause of catholic dalits as a pretext. The school now caters largely to upper caste converts from other states.

Given these injustices, the catholic clergy first needs to own its mistakes before blaming any outside agency for the pathetic conditions of dalit Christians. This in no way underplays the need to bring the dalit Christians, who of late are increasingly becoming victims of caste atrocities in society at large, under the protective cover of Prevention of Atrocities Act and Protection of Civil Liberties Act.

SRI LANKA

Peace Still Far Away

THE LTTE's defeat in Jaffna, and the consequent sufferings of thousands of Tamils who have been forced to move out from their homes there and seek refuge elsewhere, have been brought about as much by the intransigence of LTTE boss Prabhakaran as by the newfound self-confidence of the Sri Lankan military forces. By rejecting president Chandrika Kumaratunga's offer for peace talks and violating the cease-fire in April this year, Prabhakaran lost the chance of gaining for himself a pause to reconsider the strategy of 'Eelam, now-or-never' and for his guerrillas the much-needed breather.

Leaders of national liberation movements, whether Ho Chi-minh in the past or Nelson Mandela and Yasser Arafat recently, have always fought their wars step by step. They had chosen certain stages of their long drawn out struggles as intervals to negotiate with their foes, and managed thereby to gain a period of peace and stability for their people during which they prepared themselves for the next round of struggle.

As is quite evident now from the reverses suffered by the LTTE, Prabhakaran's guerrillas, in spite of their possession of sophisticated weaponry like rockets, have not yet been able to graduate into the position of a regular army that could take on the Sri Lankan army in a conventional war. In such circumstances, Chandrika's earlier peace plan that gave the Tamils in the north a large degree of autonomy over education, local government, housing and agriculture (a virtual recognition of the LTTE-run parallel civil administration in Jaffna) could have been the best bet for Prabhakaran. It could have provided a temporary reprieve for the war-weary and beleaguered Tamils of Jaffna, before the LTTE could reorganise its followers and fighters.

But even if the Sri Lankan army clears Jaffna of the LTTE and establishes some semblance of governance by propping up an administration manned by local Tamils (like the anti-Prabhakaran political groups), it would not have a smooth sailing. The LTTE would revert to its terrorist acts and disrupt any prospect of peace. Notorious for its unscrupulous tactics, the LTTE could deploy the surviving stragglers from its defeated ranks to wreak vengeance on soft targets like Muslim or Sinhala civilians (which it had done before) to create a communal conflagration. The ordinary people of Sri Lanka - both the Sinhalese and the Tamils - may have to live with bomb blasts, political assassinations and senseless massacres, and share the lot of their comrades in Srinagar, Delhi, Karachi and other epicentres of violence.

Chandrika is well aware of this possibility and has been honest and bold enough to publicly admit that a military defeat of the LTTE is no solution. She therefore keeps on harping on her government's readiness for talks with the LTTE. She knows what she is talking about. She will never be able to wipe out terrorism as long as a defeated LTTE remains a sullen enemy and continues to carry out its destructive acts. A policy of escalating military confrontation with the LTTE would not only mean further alienation of the Tamil civilian population, but also increasing dependence on the army, and a hike in defence expenditure. A cabinet committee in Colombo is believed to have recommended the conscription of all able-bodied youth and setting up of factories to produce 'lethal items'. Such developments do not bode well for a country already reeling under economic hardships and a decade-long civil war.

SIEMENS

New Ventures

SIEMENS closed the financial year ended March 1995 with a turnover of Rs 793 crore up by 20 per cent from Rs 662 recorded in the previous year. Other income rose from Rs 24 crore to Rs 105 crore, a massive rise of 338 per cent. Total income rose by 31 per cent from Rs 686 crore to Rs 898 crore. Interest costs rose by 59 per cent. An 84 per cent increase in the provision for depreciation, though offset to a certain extent by an 8 per cent fall in the tax provision, took its toll on the bottom line, and the company ended with a net profit of Rs 36 crore against Rs 28 crore in the previous year, up by 29 per cent. Exports for the year under review rose by 28 per cent to Rs 87 crore. A 49 per cent increase took imports to Rs 95 crore. A dividend of 55 per cent has been declared against 45 per cent last year.

The company, with a 51 per cent foreign stake, is into diverse activities. Its factory at Bombay manufactures radiological diagnostic systems, apparatus for high frequency physiotherapy and electrosurgery, its units at Kawk make switchgears, motors and switchboards respectively. Industrial electronic products for instrumentation and controls, drives and automation systems are made at Nashik while the Joka works in Calcutta produces power/motor control centres, control desks/panels and non-standard custom designed switchboards. The factory at Aurangabad makes switchgears and has set up facilities for the manufacture of solar photovoltaic modules and systems. At Goa the company is into the manufacture of medical industry products.

The automation systems division registered a growth of 40 per cent for the year under review. The division introduced a number of new products in the market, notable among them being the COROSLSB WIN, a windows based operator station for powerful man-machine communication. The company plans to introduce a new generation of programmable control systems.

The boom in the white goods sector augured well for the components division and sales increased by 47 per cent over the previous year. The division introduced new products like saw filters, film capacitors, ferrites into the entertainment field.

The uninterrupted power supply (UPS) division fared well as a result of the expansion in the information technology and telecom sectors. The importance given by the

government to non-conventional sources of energy such as wind energy also culminated in good orders for wind generators. The year saw the medical engineering division supply, install and commission the gamma camera system at the Hinduja National Hospital in Bombay which is used for studies of organs like the heart, liver and kidney. This followed the commissioning of the magnetic imaging resonance system used for whole body imaging.

The power transmission and the distribution systems division received good orders for medium voltage switchboards and low voltage switchboards, significant among them being the ones for supply of motor control centres to Calcutta Electric Co for their power plant at Budge Budge and outdoor vacuum circuit breakers to the Maharashtra State Electricity Board. The power generation division got a boost with a Rs 107 crore order from the Neyveli Lignite Power Corporation. It has also bagged another Letter of Intent for Rs 330 crore from Durgapur projects for the modernisation and augmentation of generating capacities of its power plants.

The company's project division has performed to satisfaction. Its strength in the iron and steel sector was seen from the orders it received from top Indian corporates.

While strengthening its position in railway signalling, the company has decided to diversify into manufacture of rolling stock, including railway engines, wagons and coaches. The company, the largest supplier of light rail vehicles in the world, has signed an agreement with the Rail Coach Factory at Kapurthala to manufacture light rail vehicles with know-how from Siemens AG.

The switchgear division, the company's most profitable division, grew significantly with new products. A four-year-old in the field of telecommunications, the company is into public switching equipment, transmissions systems, mobile telephone networks and optical fibre cables.

The company has a number of joint ventures on the anvil. It is setting up a 400 mw gas-based power plant in Gujarat in collaboration with Siemens AG, Germany, and the Torrent group. The company plans to invest \$ 1 billion in India over the next five years, most of it in power and telecommunications. In the telecom sector, the company has tied up with Bharti Telecom which makes the Beitel range of telecom equipment to form Siemens Telecom. The company will market the Siemens range of cellular phones, corded and cordless tele-

phone sets and fax machines, in addition to the Beitel range of products.

With the intention of manufacturing soft ferrites, the company has formed International Ferrites with ACC Siemens, Matsushita Components GmbH and WIEL. Siemens with a 10 per cent stake in the project will be handling local sales in India. For developing communication software, the company has floated a new venture, Siemens Communication Software. Targeted at the telecom segment for payphones, banking for ATMs, and access control systems for strategic locations, the company has entered the SmartCard business through a memorandum of understanding signed with Asia Chip Card of Singapore and Semiconductor Corporation in Chandigarh. The prospects for the components division appear to be bright with the emergence of the paging systems and cellular mobile phones.

Siemens has been awarded the ISO 9000 and EN46001 certification by TÜV covering the areas of design, development, production, installation and servicing of the entire range of products. Siemens is the first company in India to be honoured with such a certification specific to the field of medical devices.

SUKRA DIAMONDS

Higher Profits

Incorporated in Bombay in 1985, Sukra Diamonds shifted its base to Surat, India's largest diamond processing centre, in 1991. The company, with plants in Basni in Rajasthan and Goregaon and SEEPZ in Bombay and branches all over the world, is engaged in the manufacture and export of cut and polished diamonds and diamond studded gold and platinum jewellery. The company has access to a steady and assured supply of rough diamonds from De Beers, the world's largest supplier of diamonds.

For the year ended March 1995, the company recorded a sales turnover of Rs 572 crore, up by 34 per cent from Rs 428 crore in the previous year. A reduction in other income notwithstanding, the company increased its total income by 40 per cent against last year. Interest costs moved up by 11 per cent. A 28 per cent rise in the provision for depreciation was taken care of by a 60 per cent decline in the provision for tax and the company closed the financial year with a net profit of Rs 48 crore, an increase of 68 per cent from Rs 29 crore recorded in

the previous year. According to company reports, actual performance could have been better had it not been for the plague which struck Surat in 1994, though the effects were nullified to a certain extent on account of the company having its units spread across the country. A dividend of 25 per cent has been recommended by the directors.

The diamond industry has witnessed a steady growth since the late eighties with the government laying emphasis on exports. Production of fully processed diamonds has gone up from 4 lakh carats in 1993-94 to 5 lakh carats in 1994-95, that of the diamond studded gold jewellery has shown a rise in production from 70 kg in 1993-94 to 124 kg in 1994-95. Exports of gems and jewellery from India during 1994-95 stood at Rs 14,618 crore compared to Rs 12,493 crore, an increase of 13 per cent. Gems and jewellery exports accounted for 18 per cent of the country's total export earnings.

The exports of the company for the year under review stood at Rs 570 crore, accounting for around 9 per cent of the country's exports. Imports for the same period stood at Rs 419 crore. Su-raj sells its diamonds to importers/wholesalers in New York, Antwerp, Tokyo and Hongkong. The company intensified its marketing efforts in the USA and South-East Asian countries. Entering the West Asian export market with its jewellery range for the first time, the company received an encouraging response. The company faces competition mainly from South East Asia and China.

The company has expansion projects on hand at Bangalore, Jodhpur and SEEPZ in Bombay. While the project at Bangalore is expected to process 53,000 carats of diamonds and 65,000 rings for the manufacture of jewellery, bottom press pots, required for the diamond industry are to be manufactured at Jodhpur. The centre at SEEPZ has been planned to cater to the needs of its overseas clients, with commercial functioning expected by December 1996.

The company received the largest diamond exporter award for 1993-94 from the Gem and Jewellery Export Promotion Council in March 1995 for exporting diamonds worth \$130 million.

PUNJAB TRACTORS

Rise in Sales

Promoted by the Punjab State Industrial Development Corporation (PSIDC), Punjab Tractors has been incorporated in 1970 with PSIDC holding 26 per cent of the equity, mutual funds and financial institutions 40 per cent, FIIS 10 per cent and the public the rest. The company commenced

production in 1974 based on indigenously developed technology.

For the year ended March 1995, the turnover of the company stood at Rs 361 crore, up by 37 per cent from Rs 263 crore recorded in the previous year. Other income rose by 38 per cent from Rs 5 crore to Rs 7 crore. Total income of the company went up by 36 per cent from Rs 268 crore to Rs 366 crore. Interest costs came down by 30 per cent. Provision for depreciation and interest rose by 9 and 39 per cent, respectively, doing little harm to the bottomline and the company closed the financial year with a net profit of Rs 27 crore, up by 57 per cent from Rs 17 crore recorded in the previous year. The company has declared a dividend of 100 per cent against 80 per cent last year.

Tractors constitute the major product contributing about 95 per cent to the aggregate turnover of the company. The company has its presence in the low, medium and high power categories, with a market share of 14 per cent in its core tractor business. For the year under review, the company sold 23,211 tractors against 18,211 in the previous year, registering a growth of 27 per cent against the industry growth of 19 per cent.

An improvement was seen in the company's harvester combine division. The sale of Swaraj Harvester Combines and forklifts reached 112 and 100 against 65 and 80, respectively. The production at the foundry touched 5117 mt registering a 17 per cent growth over the previous year.

The demand for tractors is on the rise and for the year ended March 1995, the industry posted a sale of 1,64,000. The demand for tractors over the next decade is projected to grow at 8-9 per cent annually. The company has the advantage of a good marketing network of 250 dealers. The main strength of the company lies in its research and development facilities which manifest in better quality and reduced costs. Another strength of the company lies in its ability to develop models suited to local requirements. The tractors manufactured by the company are made wholly with local technology and know-how. This results in substantially lower capital costs, no royalty payments for technology transfer and no outgo of foreign exchange.

Punjab Tractors is expanding its capacity from 21,000 to 36,000 tractors per annum. The total outlay for the expansion programme has been set at Rs 25 crore. Over the next two years, the company is planning to gradually shift to the high power segment. Also on the anvil is a quality improvement programme at the cost of Rs 8 crore aimed at capturing the export market. Both the programmes are to run simultaneously.

The company has built up strong R and D capabilities. In anticipation of further growth opportunities and increasing competition, the company set up a new R and D and spare parts complex in 1991. Engines which account for around 30 per cent of the material

costs are procured from Swaraj Engines, group company and Kirloskar Oil Engine. Striving towards zero defect in production the company has reduced its warranty cost to Rs 240 per tractor, the lowest in the industry.

INTERNATIONAL JOURNAL OF DEVELOPMENT PLANNING LITERATURE

CALL FOR PAPERS

Unpublished research papers on any topic related to development studies are invited for publication in the **International Journal of Development Planning Literature**, ISS No. 0970-3608, started in 1986. This Journal has an Editorial Board of internationally distinguished economists and is published quarterly by the SPELL BOUND PUBLICATIONS PVT. LTD., ROHTAK

Authors may contact:

Professor S. Bhagwan Dahiya

Chief Editor,

**INTERNATIONAL JOURNAL OF DEVELOPMENT
PLANNING LITERATURE**

Post Box 91, Rohtak-124 001 [INDIA]

APPOINTMENT:

VACANCIES FOR RESEARCH STAFF

The Centre for Enquiry into Health and Allied Themes (CEHAT) invites applications from women candidates for our project on women's health.

Research Officer: Ph.D./M.Phil/Post graduates in recognised discipline or graduate in medicine, engineering with relevant research experience, proven writing skills and capacity to do independent research.

Junior Research Officer: Post graduates in recognised discipline or graduate in medicine, engineering without relevant research experience but interested in research.

Research Assistant: Graduate in a recognised discipline with some experience in assisting in research or community based work.

Social Worker: Graduate or post graduate in social work.

CEHAT is a non profit research collective/institution conducting research on topics of relevance to the health and well-being of the disadvantaged and the poor. Pay scales are comparable to UGC scales and the emphasis is on a democratic and participatory mode of decision-making

All the above positions are Bombay-based and involve travelling to rural areas of Maharashtra. Suitable candidates may apply with detailed curriculum vitae to the director at the address given below within 15 days.

CEHAT

519, Prabhu Darshan, 31, S. Sainik Nagar, Amboli, Andheri (W)
Bombay 400 058.

CURRENT STATISTICS

EPW Research Foundation

The expansion in net RBI credit to the centre has again accelerated to Rs 16 729 crore as on November 3 (total has accounting for Rs 13 990 crore). Aggregate deposit growth continues to be sluggish at Rs 10 793 crore (2.8 per cent) as on November 10 compared to Rs 23 356 crore (7 per cent) in the comparable period of 1994-95. Non food credit expansion by banks has been faster than in the previous year (1.6 per cent compared to 4.6 per cent). Call money rates remained high and volatile during November touching 142 per cent on November 3 reflecting the liquidity crunch. The RBI preferred 14 per cent fixed coupon floatation of dated securities. Six month forward premium on the dollar touched near 70 per cent.

Landmines and Blinding Laser Weapons

A G Noorani

Everyone is a 'realist' after his own fashion while the danger from landmines and laser weapons keeps mounting. India could combine some idealism with realism and give a lead. It is a challenge to India's creativity.

INDIA has ranged itself strongly against international terrorism and has begun enlisting support from other countries. It is only another aspect of that vice, another front in the good battle for India to take keener interest and fight with greater determination and clarity than it has the menace of landmines that lie scattered over very large parts of the globe and the laser weapons that are used for blinding soldiers and civilians.

As the president of the International Committee of the Red Cross, Cornelio Sommaruga, said, "laser weapons suitable for blinding large numbers of soldiers or civilians at long distances are on the verge of large-scale production and export. Once produced in large numbers, these small arms will cost little more than an ordinary rifle and will proliferate rapidly not only to traditional armies but to terrorists and criminals. Whatever the intention of producers may be, like landmines, once they proliferate laser weapons are likely to be used indiscriminately" (italics mine, throughout).

Sommaruga was making a statement on September 26 in Vienna to the Review Conference of the states which are parties to the 1980 convention on 'prohibitions or restrictions on the use of certain conventional weapons which may be deemed to be excessively injurious or to have indiscriminate effects' - to use its full title, regardless of the pain it inflicts on the jaws.

It is not difficult to perceive the dreadful peril to human life - a weapon that costs no more than a rifle but can be used by any terrorist to threaten or actually blind anyone he chooses to. Sommaruga appealed to the conference to adopt a new Fourth Protocol to the 1980 convention which would totally prohibit the use of laser beams to blind persons as a method of warfare, prohibit the production of weapons suitable for such use and prevent their proliferation. "It is essential to address this problem now. Later may simply be too late."

To turn to landmines, it is estimated that about 110 million unexploded mines are

scattered around the world and that they kill nearly 1,000 people every month while an equal number are maimed. A landmine costing as little as US \$ 3 to buy costs up to \$ 1,000 to clear. They were placed in Afghanistan by the Russians and in Angola, Cambodia, Bosnia and Croatia. The Russians have now repeated their performance in Chechnya.

Protocol II to the 1980 convention on 'prohibitions or restrictions on the use of mines, booby traps and other devices' says that mines may be directed only at military objectives, indiscriminate use is prohibited, and all feasible precautions must be taken to protect civilians, remotely-delivered mines may not be used unless their location is accurately recorded or they are fitted with an effective neutralising mechanism; records must be kept of the location of pre-planned minefields, and the parties to a conflict are also to keep records of other minefields laid during hostilities; at the end of hostilities, the parties are to try to agree, either among themselves or with other states or organisations, to take the necessary measures to clear minefields.

The ICRC, assisted by six NGOs, launched its campaign in April 1993 to increase public awareness of landmines. Expensive demining operations are afoot in Afghanistan, Angola, Cambodia, Mozambique, northern Iraq, Rwanda, Somalia and Yemen.

India ratified the 1980 convention on March 1, 1984 and Pakistan on April 1, 1985. As of July 7 this year only 50 states had ratified it. Sri Lanka is not one of them. The major weaknesses of the convention are that it does not apply to internal armed conflicts where most mines are used; assigns no clear responsibility for the removal of mines; does not prohibit the use of non-detectable mines and has weak provisions governing remotely-delivered mines; does not include any control regime for mine transfers and exports; and lacks implementation and enforcement mechanisms.

In 1994 the UN General Assembly endorsed the goal of "eventual elimination

of landmines" (Res. A/RES/49/75D). The greatest danger to life is posed by what are called 'dumb' or non-self-destructing landmines as distinct from the 'smart' ones which have self-destructing mechanisms.

International opinion is divided. Sri Lanka's former ambassador to the UN, Stanley Kalpage, said, "in the world of United Nations *realpolitik*, the member states appear convinced that an outright ban, given the combined problems of creating verifiable international agreements and implementing them, is little more than romantic humanitarianism." Kalpage's words are particularly saddening because, as well as serving with distinction as his country's high commissioner in India, he is also a teacher of high eminence. In fact his words highlight the need for a total ban.

Certain details are relevant in this context. As of July this year, over 20 states had announced comprehensive moratoria on the export of all anti-personnel mines, limited moratoria on transfers of non-self-destructing mines or moratoria on exports to states not party to the 1980 UN weapons convention. States which have declared a comprehensive moratorium are Argentina, Belgium, Cambodia, Canada, Czech Republic, France, Germany, Greece, Israel, Italy, Poland, Slovak Republic, South Africa, Spain, Sweden, US, Romania, Portugal and Japan. Limited moratoria have been announced by the Netherlands, Switzerland, Austria, the United Kingdom, Russia and the European Union. On March 2 this year Belgium became the very first country to enact a law that completely bans the manufacture, trade, use and stockpiling of anti-personnel mines, or any other weapon built for the same purpose, on its territory - even by its own army.

The following states have expressed support for a total prohibition of anti-personnel landmines: Afghanistan, Australia, Austria, Belgium, Cambodia, Colombia, Estonia, Iceland, Ireland, Laos, Malaysia, Mexico, New Zealand, Nicaragua, Norway, Peru, Slovenia, Sweden, Switzerland and the 52 countries of the Organisation of African Unity. India's omission in all the three lists is conspicuous and unfortunate.

The Vienna conference ended on October 13. Reports on the results are not very clear. M S Prabhakara reported from Cape Town, in the issue of *The Hindu* of October 14, a distressing similarity in the positions of India and South Africa. Both seek to continue to manufacture and use landmines for 'defensive purposes' within the limits of the none-too-satisfactory 1980 convention. This implies, according to the leader of the South African delegation, Abdul Minty, "the

exclusive use of reliable self destructing and self deactivating anti personnel landmines within a realistic time frame' and 'the destruction of existing stocks of long lived anti personnel mines

Prabhakara added the Indian approach according to a weekly newsletter being published from Vienna by the International Campaign to Ban Landmines appears to correspond to the South African approach. At a presentation made to an open NGO briefing in Vienna the Indian ambassador Arundhati Ghosh said India did not want to focus on the use of landmines as a defensive weapon but to focus on lessening the impact of landmines on the civilian population. According to the newsletter the Indian ambassador said India did not have a problem with landmines and did not use them internally except in specific cases and under specific authority. While India wanted to move forward making landmines detectable and incorporate into them a self destructive feature it needed both the time and the technology to convert to these systems. India according to the CCW newsletter also had a major problem with verification. Verification the newsletter quoted the Indian ambassador as saying was a disarmament issue and with only five developing countries participating in the review conference India felt that the inclusion of intrusive measures would discourage countries from becoming party to the CCW.

According to Prabhakara,

Underlying the South African (and Indian) approach to the problem and the apparent reservations over the call for a total ban on the production of landmines is the issue of national sovereignty though such sensitivities and indeed the very concept of national defence in the case of the less developed countries tend to be scoffed at by NGOs occupying the moral high ground. India as an inheritor to an alleged Gandhian tradition of absolutist pacifism and non violence has had its share of such moral disapproval in the past in respect of its defence policy and huge defence allocations. It is now the turn of the new South Africa whose own high moral stature is still relatively intact to be the victim of similar disapproval.

India Pakistan and China rank among the producers of landmines. Jane's *Defence Weekly* of June 17 1995 reported that 'in closed door discussions held in Geneva earlier this year is part of the lead-up to the UN sponsored review conference set for this autumn. Chinese representatives opposed the introduction of a specific minimum moral content for landmines. China Cuba India Iran and Pakistan objected to provisions limiting export activities. China Cuba Iran and Pakistan further refused to accept verification provisions or enforcement measures. Cambodia is among the few countries (none other from Asia) that have

initially supported a complete ban on the production use and export of anti-personnel landmines." Jane's Pointer of June 1995 carried a report titled 'China Markets Blinding Laser

The Vienna conference is reported (*Indian Express*, October 11, 1995) to have agreed that all anti-personnel mines should be detectable, and discussed a Fourth Protocol to the 1980 Convention to restrict if not ban the use of laser blinding weapons.

The British foreign office minister, David Davis in a statement on the concluding day of the Vienna Conference October 13 said that he was disappointed that the conference was 'suspended' without agreement until December with a view to reaching agreement by May 1996. He attributed this to the determined obstruction of a number of countries. His country was against what he called 'the irresponsible use of anti personnel landmines'. Davis also said that this unfortunate outcome demonstrates that we were right from the start to argue for realism. Nobody can now believe that a total international ban on landmines effective in the regions where they are most used and abused would be practical politics.

This is in line with Kalpage's stand. Everyone is a realist after his own fashion while the danger keeps mounting India could combine idealism with realism and give a lead. It is a challenge to India's creativity.

Research Papers of the Public Affairs Centre

The Public Affairs Centre (PAC), Bangalore, is a non-profit organization dedicated to the cause of improving the quality of governance in India. Towards this end, it undertakes and supports research on public services and policies, disseminates research findings, and assists citizen groups concerned with improving governance. The following publications of the Centre are now available:

1. A Report Card on Public Services in Indian Cities: A View From Below – Rs. 30 or \$ 7 *
2. Public Services for the Urban Poor: A Report Card on Three Indian Cities – Rs. 25 or \$ 5
3. Strengthening Public Accountability: New Approaches and Mechanisms – Rs. 25 or \$ 5
4. Making the Grade – How do Public Service Providers in Your City Measure Up? (A Guide for Implementing the Report Card Methodology) – Rs. 20 or \$ 4

* Foreign orders only, include \$ 2 as processing charges

Please send the payment through bank draft/postal order/cheque (include Rs. 5/- for outstation cheques) in favour of **Public Affairs Centre**, Bangalore, and mail to Public Affairs Centre, 707, 6B Cross Road, Block 3 Koramangala, Bangalore - 560 034. Tel & Fax (080) - 5537260

Biotechnology's Decade of Stagnation

P M Bhargava

The department of biotechnology was set up a decade ago to facilitate rapid developments in an emerging field. What has been achieved today?

IT is widely recognised around the world today that advances in biotechnology, along with those in material science, computers, microelectronics, artificial intelligence, space sciences and new sources of energy, would be the major determinants of our life styles in the foreseeable future. Biotechnology, like computers, has now become a part of our common vocabulary. What has our government done in regard to biotechnology, specially when we have a full fledged department dedicated to it in Delhi?

The structure of biotechnology today rests largely on the following pillars:

(1) *Genetic engineering*: Allows a genetic capability of one organism to be transferred to another organism that may lack the capability. Thus, the common bacterium *E. coli* can be made to produce human insulin which has otherwise been a rare commodity, in large amounts by such a genetic transfer, using the technology of genetic engineering. In fact, the insulin that we generally buy in the market today, for the purpose of injection for certain kinds of diabetic patients, is human insulin made through genetic engineering.

(2) *Immunotechnology*: One of the ways in which we fight infection is by producing a class of chemical compounds called antibodies. Since the production of an antibody is extremely specific to the foreign substance or organism against which it is directed, one can use this specificity to identify the organism or the chemical agent causing a pathological condition much before it has given rise to clinical symptoms. Today, the technique of monoclonal antibodies, for which a Nobel Prize was given, allows us to produce such specific antibodies in the laboratory on a large scale rather inexpensively. Monoclonal antibodies are less than 15 years old, but last year accounted for a turnover of probably more than five billion dollars worldwide. Today, they are used, extensively in diagnosis and are also being increasingly used for treatment of certain diseases.

(3) *Tissue culture*: In this technique animal and plant cells can be grown outside of the animal or the plant in large numbers; it has been, in fact, possible for nearly half a century to grow a whole plant (for example, a carrot plant) from a single cell. In case of plants,

this technique can be used, for rapid propagation of elite plants which would have otherwise taken decades to be propagated in that number. This technique is also being increasingly used to produce substances of commercial importance in large amounts that are difficult to synthesise in the laboratory chemically.

(4) *Enzyme engineering and technology*: Enzymes are biological catalysts used by living organisms for the enormous number of chemical reactions that occur in them. Most chemical processes that have formed the basis of chemical industry since the Industrial Revolution of the 18th century have, however, used inorganic catalysts for increasing the rate at which the desired product is produced in the chemical reactions comprising the process. Inorganic catalysts require, often, high temperatures and high pressure, the creation of which conditions is energy-intensive and expensive. Enzymes, however, operate optimally at normal temperature (30-37°C) and pressure. They are, therefore, being increasingly used in industry for catalysing chemical reactions. A major problem with enzyme catalysts – that they are generally unstable – is now being overcome by several ingenious techniques.

(5) *New reproductive technologies*: These technologies, such as in vitro fertilisation (commonly known as the test-tube baby technique), allow an infertile couple to have a child of their own. There are many variations of these technologies available today that have been commercialised – such as the development of a couple's biological child in the uterus of a surrogate mother who would, therefore, have no relationship whatsoever to the child even though she would have delivered it.

(6) *New medical technologies*: Examples would be the new diagnostic techniques using various kinds of scanning such as ultrasound, computer aided tomography (Catscan), positron emission tomography (PET), or magnetic resonance imaging (MRI). Another example would be the use of specific carriers to deliver drugs to specific sites or organs needing it, so that the rest of the body is not exposed to the possible toxic effects of the drug.

(7) *New DNA based technologies*: DNA is the genetic material. A widely used example of a DNA technology would be DNA fingerprinting. There are two commonly used techniques of DNA fingerprinting available today, the one discovered by Sir Alec Jeffreys of the UK which is used in the west, and the other discovered by Lalji Singh of India which has been used extensively in our country. This technique allows unequivocal identification of an individual by a very small amount of the person's blood, semen, skin, tissue piece, hair-root or the like. It has many varied uses, including establishment of parentage, and identification of a rapist or murderer on the one hand and seeds or plants on the other.

SETTING UP OF THE DBT

To those of us who had a ringside seat in the drama of the biological revolution that began after the last world war, it was obvious by the late 1960s that unprecedented, unexpected and large-scale applications of biotechnology were upon us. Two major discoveries made subsequently, in the late 1970s and the early 1980s, were responsible for making this prediction come true: the discovery of genetic engineering and of the monoclonal antibody technique, for both of which Nobel Prizes were awarded.

Our science was then in the hands of some of the most committed and successful scientists of our country. During this period, I had occasion to discuss the question of our country's possible investment in biotechnology with most of these scientists – for example, those who headed our space, atomic energy and agriculture programmes, and those who were then the presidents of our academies of science. What came out clearly in these early discussions was that Indian must invest in research and development-cum-production activities in at least eight selected areas: genetic engineering, immunotechnology, tissue culture, enzyme-based technologies, photosynthesis, plant-based indigenous drugs, alcohol production from non-conventional sources (such as grass), and new biology-based energy technologies such as energy plantations using genetically engineered plants.

Following a meeting held in Delhi on July 28, 1981, chaired by M G K Menon (the then secretary of the department of science and technology (DST)), (for which I had the privilege of preparing the base paper) and a meeting of the Scientific Advisory Committee to the Cabinet (SACC) held on the following two days which was chaired by M S Swaminathan, a decision was taken

to set up the National Biotechnology Board (NBTB). The Board was actually set up after a couple of years but this step was inadequate for the development of biotechnology. The Board had very little funds and no independence. It had an executive secretary, but all the real powers were vested in the secretary of the DST. It was therefore no surprise that the NBTB accomplished very little. After this was pointed out by some of us to the prime minister Rajiv Gandhi, in 1985 the government of India decided to set up finally the department of biotechnology (DBT) in July 1986.

The DBT will complete 10 years at the beginning of 1996, which is a reasonable time to assess the performance of even a government department. One way to make this assessment would be to ask what would have happened if the department was not there. Unfortunately the DBT itself has been unwilling to do this exercise. Another way would be to list biotechnology based industries that the DBT has spawned. The answer is virtually none. Whatever has happened in the area of biotechnology in the country has been outside of the purview or influence of the DBT and would have happened even if the DBT was not there. In the eyes of the industry, including the fledgling biotechnology industry in the country, and the people of the country, the DBT has been a non entity. The only ones who have supported it are largely the small number of scientists in the country who have personally benefited from it through grants they have received from it for their personal research work that has had no direct relevance to the development of biotechnology in the country.

The DBT does not even have an information base (let alone a mechanism to keep it updated in real time) which, on the basis of market information in the country and abroad, would help private investors decide what they could reasonably safely invest in. The department has not surely earned the trust and faith of Indian industry. The DBT, however, has one major accomplishment for which it can take a part of the credit, the rest going to N Seshagiri, earlier of the department of electronics and at present a secretary in the Planning Commission. This accomplishment is the setting up of the bioinformatics network in selected areas around the country; this network has been of the greatest use to scientific researchers.

For the rest the DBT has primarily (a) served as a grant giving agency which is precisely what it was not supposed to be, and (b) supported selected universities by providing funds to set up teaching departments of biotechnology which essentially are departments of modern biology. In this connection it is noteworthy

that very few (less than 10 per cent) of those who have been products of these teaching departments financed by the DBT are working in an Indian industry.

DBT has not been able to show a significant upward trend in performance in spite of the fact that for the last two years or so the department has been fortunate in having a secretary whose commitment, purposefulness, integrity and concern have never been in doubt. It would therefore be pertinent to ask as to why this situation with our biotechnology programme? As it turns out the blame lies primarily with our scientific community responsible for the policies and activities of the DBT from within and without. It has been, with very few but notable exceptions, unimaginative and selfish with a dog in the manger attitude.

As an example, take the case of DNA fingerprinting, an area in which the country established leadership as far back as 1989. The then prime minister Rajiv Gandhi had approved the setting up of a national centre for DNA fingerprinting and diagnostics based on the Indian technique developed by Lalji Singh. Lalji was invited to host the Third International Conference on DNA Fingerprinting in December on the basis of Lalji Singh's accomplishments in the area, but the centre for DNA fingerprinting has yet to come. On two occasions, even the money for it had been approved, on one of these occasions Rs 50 lakh allocated specially for the national centre for DNA fingerprinting lay in a bank in Hyderabad, but had to be returned to the government of India after a year or so, as no significant steps were taken during the period to set up the DNA fingerprinting centre. The nodal agency for piloting the project of setting up the centre for DNA fingerprinting has been the DBT.

According to a report in *The Hindu* (April 2) the problem in the DBT was a tussle between the scientists and the IAS officers. It is probably partly true but then one should ask as to when such a tussle takes place. It occurs when a majority of the scientists at the top of the hierarchy in the organisation abrogate or misuse their authority, that is use it for their own ends and not for the purpose for which the organisation was set up. After a while this becomes the culture of the organisation, and difficult to change. We should remind ourselves that before the last World War it would have been unthinkable to have an IAS officer as the vice chancellor of any of our universities. But, then, a stage came in the progressive degeneration of our universities when an IAS officer could do much better as a vice chancellor than the academicians that had immediately preceded him and we had many universities with a civil servant as vice chancellor. The unfortunate day may not be far when the

government has no choice but to appoint a civil servant as secretary of the DBT. The superannuation according to the government rules of the present secretary of the DBT is not far off and I do not see anyone in our country today who would be suitable as his successor. On the contrary I am both amused and concerned by the extremely low collaboration of those among our scientists who seem to be actively lobbying for the position.

A part of the blame for the fact that the DBT has not been able to deliver any of the goods it was supposed to, must lie with the government too, which has sought no real accountability from it. Seeking accountability demands a concern and for that the government has had neither time nor inclination. In this connection it is noteworthy that the last meeting of the Scientific Advisory Committee of the DBT on June 6 and 7 was held after a gap of over a year. The only way to rectify this situation in an area that may be of the utmost importance to the country in the years to come, would be for the government to seek the following three kinds of accountability in respect of the DBT through an appropriate mechanism.

(1) *Scientific accountability*. What is the quality and quantity of the scientific work done under the auspices of the DBT in relation to its major objective of establishing biotechnology industry in the country? It is not enough to have scientific papers published in good scientific journals by those who have been supported by the DBT. We must ask: Do these papers represent a breakthrough that would help the development of biotechnology in the country?

(2) *Financial accountability*. What has actually been achieved in the country in terms of production which is due entirely to the efforts of the DBT, specially in areas in which no other agency such as the ICAR has been working? This should be judged from stringent international standards.

(3) *Social accountability*. In what way has the department contributed to social progress, for example through development of technologies that could be used in the villages and could provide additional employment to those who work in the agricultural sector?

Impact of Prohibition on State Excise Study of Four Southern States

Joseph Abraham

Can state governments reduce their financial dependence on taxes on various types of alcohol, so as to improve the overall health, efficiency and productivity of labour and the general welfare of the people? An examination of the pattern of excise revenue from alcohol in the four southern states of Andhra Pradesh, Karnataka, Kerala and Tamil Nadu

THE debate on whether economics is a science of wealth or a science of welfare can be traced to the time of Adam Smith and Alfred Marshall. The theory of welfare economics has rich literature analysing the ethical, moral and welfare dimensions of economic policies. The interrelationship between economic efficiency and ethics was given a rigorous theoretical and empirical foundation through the numerous works of renowned economists like Karl Polanyi, Fred Hirsch, Albert Hirschman, Amartya Sen and Kenneth J Arrow. It is now widely accepted that an effective economic policy demands serious consideration of its ethical and welfare implications also, though on several economic issues one may have difficulty in reconciling economic targets with the ethical and moral targets. One such issue is that of resource mobilisation through excise tax revenue and its welfare implications.

The concept of resource mobilisation is generally considered as falling within the domain of positive economics and is seldom included in the purview of normative economics. However, certain sources of resource mobilisation especially those from tax on alcohol, tobacco, etc. being demerit goods with negative externalities have considerable welfare and ethical and hence normative implications and therefore it is necessary to examine these issues from the welfare and ethical perspective also. This would enable the reconciliation of the twin goals of resource mobilisation through tax revenue for economic planning and that of maximisation of health, standard of living, productivity and efficiency of labour and overall net disposable income and saving of households and family welfare, etc. Today, we are commemorating the 126th birth anniversary of Mahatma Gandhi, whose battle against alcohol and drinking was a lifelong struggle and in this context, the issue of the ethics of revenue mobilisation from alcohol assumes particular significance and hence requires serious consideration.

In India, the state excise is a major source of revenue of state governments. The major part of state excise revenue of state government is derived from various types

of alcoholic beverages. But from the perspective of health, standard of living, overall productivity and efficiency of manpower, alcohol is highly injurious. There comes a point, however, when the economic benefits of excise revenues are outweighed by the social costs of heavy alcohol consumption like increasing crime, poor productivity, absenteeism and increasing number of problems of children of alcoholic parents, reduced life expectancy and alcohol related health problems, all create a heavy burden on the state exchequer. A high proportion of road accidents are also caused by alcohol consumption. The excise revenues from alcohol will not cover the cost of negative effects of alcohol consumption. The general public health would be at risk and the time has now come to tackle the problem seriously. According to Mahatma Gandhi, 'Drugs and drinks are the two arms of the devil with which he strikes his helpless slaves into stupefaction and intoxication'.

Alcohol being a major source of tax revenue, many states are reluctant to reduce the dependence on this source of revenue for their resource mobilisation. Certain states like Andhra Pradesh and Tamil Nadu have only partial prohibition since prohibition is confined to only certain specific types of alcohol, i.e. country spirit and the loss of excise revenue from country spirit on account of prohibition is offset through higher tax revenue on other types of liquor like Indian Made Foreign Liquor (IMFL). The issue in this context is whether a state should seek alternative source of revenue other than from various types of liquor, so as to improve the overall health, efficiency and productivity of labour and general welfare of the individual and family.

With this objective, this note examines the pattern of excise revenue on alcohol in the four southern states of India, i.e. Andhra Pradesh, Karnataka, Kerala and Tamil Nadu, for the period 1992-93, 1993-94 and 1994-95. The data base for this study has been drawn from the various budget documents on revenue receipts of the above state governments. Section I of this study highlights the importance of excise revenue for the state

government mentioned above, the proportion of excise revenue on alcoholic beverages to total state's own resource and the distribution of state excise revenue and state's own tax revenue between various types of alcoholic beverages for the four southern states. Section II is an analysis of trends in these revenues and suggestions on possible alternatives and Section III gives the summing of findings of this study, as well as examining further research possibilities on quantifying the cost and benefits of prohibition.

I

As mentioned in Part 3 above, excise revenue is a major source of tax revenue of the state governments. In 1994-95 budget of the states under this study, the anticipated tax revenue from excise is: Andhra Pradesh (Rs. 357.25 crore), Karnataka (Rs. 806.92 crore), Kerala (Rs. 310 crore) and Tamil Nadu (Rs. 410 crore). In the case of Andhra Pradesh, there was a ban on the sale of arrack from October 1993 resulting in a revenue loss of Rs. 675 crore per annum. Before the introduction of this ban, 70 per cent of the excise revenue of the state was from arrack or country spirit. Despite the revenue loss, the ban is expected to improve the health, productivity and well being of the labour force especially those of the lower income groups who were mainly the consumers of arrack. However, this is a normative issue for consideration whether the loss of revenue is offset by the gains on productivity, income and of welfare of arrack consumers.

TABLE 1

State	Total Excise Revenue 1994-95 (BF)	Revenue from AHC (Rs. Crore)	Proportion of Revenue from AHC in State Excise Revenue (Per Cent)
Andhra Pradesh	357.25	350.00	97.9
Karnataka	806.9	782.41	96.9
Kerala	310.92	296.58	95.3
Tamil Nadu	410.00	392.97	95.8

TABLE 2 DISTRIBUTION OF EXCISE REVENUE FROM IMFL

State	Amount of Excise Revenue from IMFL	Per Cent of Revenue from IMFL to Total Revenue	Per Cent of Revenue from IMFL to Total States Own Tax Revenue
Andhra Pradesh	270.00	75.5	7.02
Karnataka	160.00	19.8	3.27
Kerala	73.10	23.5	2.97
Tamil Nadu	360.27	87.8	7.79

The major part of the revenue from state excise is derived through tax on various types of alcoholic beverages like country spirit, country fermented liquors, malt liquor and IMFL and spirits. We may term all these alcoholic beverages into a broad category termed as alcohol for human consumption (AHC). The proportion of AHC in total excise revenue of the four southern states for 1994-95 (BE) are as in Table 1.

It has been mentioned earlier that there is prohibition in Andhra Pradesh and Tamil Nadu. If a ban on the sale of arrack is introduced in the states of Karnataka and Kerala (as done by Andhra Pradesh and Tamil Nadu), anticipated revenue loss in 1994-95 (BE) would be about Rs 600 crore for Karnataka and Rs 210 crore for Kerala. If Andhra Pradesh and Tamil Nadu would forgo this source of revenue out of welfare considerations, Karnataka and Kerala can also take a normative or moral decision on this issue of banning the sale of arrack, especially when Andhra Pradesh had forgone about Rs 700 crore of excise revenue on arrack out of welfare and ethical considerations.

Further, there are various other types of AHC in each of the state where there is considerable scope for reduction in dependence on revenue from AHC. In Andhra Pradesh, during 1994-95, Rs 270 crore of excise revenue is expected from IMFL and spirits, which constitutes about 75 per cent of the states' excise revenue and about 7 per cent of the states' total own tax revenue. However, during the same period, Karnataka gets only Rs 160 crore from excise revenue from IMFL, i.e. about 20 per cent of the state excise and 16 per cent of the states' tax revenue. The share of IMFL in states' excise and states' own tax revenue in the four southern states are illustrated in (Table 2).

The two states having partial prohibition, i.e. Andhra Pradesh and Tamil Nadu, have a very high dependence on excise revenue from IMFL, i.e. Rs 270 crore (75 per cent of total excise revenue) in the case of Andhra Pradesh and Rs 360.22 crore (88 per cent of total excise revenue) in the case of Tamil Nadu. In fact, from the normative and welfare perspective, the dependence on this source of revenue, i.e. IMFL, has also the same negative welfare effects as in the case of dependence on the revenue from country spirit by Karnataka and Kerala.

II

Trends in Growth

Excise revenue as a percentage of states tax revenue shows a downward trend in the case of Andhra Pradesh, a steady trend in the case of Karnataka, Kerala and Tamil Nadu. In the case of Andhra Pradesh, the

share of excise revenue from AHC in states total tax revenue declined from 27 per cent in 1992-93 to about 9 per cent in 1994-95, primarily on account of prohibition. The average annual rate of growth of excise revenue on different types of AHC taken together is given in Table 3.

The overall situation is showing an upward growth in excise revenue from AHC in the states (Table 3), except Andhra Pradesh. Even in the case of Andhra Pradesh, if one analyses each type of AHC separately, it is observed that the excise revenue from IMFL in 1994-95 (BE) shows an increase of 80 per cent over that of 1993-94 (BE). In Andhra Pradesh, the revenue from malt liquor is also projected to increase by about 40 per cent in 1994-95 (BE) over that of 1993-94 (BE), though in absolute terms the amount of revenue expected from malt liquor in 1994-95 is only Rs 35 crore, i.e. 9.8 per cent of total states excise revenue and 0.91 per cent of the total states own tax revenue.

In the case of Karnataka, though the overall annual average growth in excise revenue from AHC in 1994-95 is only 13.8 per cent, the corresponding figure for malt liquor is 60 per cent and that of IMFL about 45 per cent. Though in absolute terms the excise from malt liquor in Karnataka for 1994-95 would be only Rs 23 crore (i.e. 2.83 per cent of states excise revenue and 0.46 per cent of states own tax revenue), the excise revenue from IMFL is Rs 160 crore (i.e. about 20 per cent of the states excise revenue and 3.27 per cent of states own tax revenue). From the normative perspective, this dependence on the source of revenue needs to be progressively reduced.

In the case of Kerala, the average aggregate growth in excise revenue in 1994-95, i.e. 34.5 per cent, is the highest among the southern states. In Kerala, the revenue from country spirit in 1994-95 is projected to increase by about 53 per cent over 1993-94 (BE). Country spirit which is to earn Rs 210 crore excise revenue from 1994-95 constitutes about 67.43 per cent of the state excise revenue and 8.5 per cent of the states own tax revenue. The excise revenue growth in IMFL is to increase by only 8.5 per cent in 1994-95 over 1993-94.

In the case of Tamil Nadu, the aggregate growth rate in excise revenue from AHC in 1994-95 is 16.5 per cent, which is made through revenue from IMFL. There is no increase in the excise revenue from other types of AHC.

The loss of revenue on account of an anticipated policy of prohibition in each of these southern states would be: Andhra Pradesh (Rs 357 crore), Karnataka (Rs 807 crore), Kerala (Rs 311 crore) and Tamil Nadu (Rs 410 crore). An illustrative model of alternate compensatory revenue mobilisation scheme to cover up the revenue loss on account of prohibition is given in Table 4.

III

The main findings of the study are:

(i) In absolute terms and also in terms of share in states own tax revenue, among the four southern states, the highest excise revenue from AHC is observed for Karnataka followed by Kerala.

(ii) In all states, the proportion of revenue from AHC is about 95 per cent to 97 per cent of the states excise revenue.

TABLE 3

	1993-94 (RI) (Rs Crore)	Per Cent Growth PA	1994-95 (BE) (Rs Crore)	Per Cent Growth PA 1993-94 (BE)
Andhra Pradesh	587.78	35.8	350.00	-61.8
Karnataka	662.33	+31.8	782.41	+13.8
Kerala	270.16	+27.3	296.58	+34.5
Tamil Nadu	380.14	30.6	392.97	+16.6

TABLE 4

	(Rs crore)			
Item	Andhra Pradesh	Karnataka	Kerala	Tamil Nadu
A. State taxes				
(1) Land revenue	30	68	26	34
(2) Sales tax	50	150	42	57
(3) Tax on goods and passengers	15	55	13	17

(2) Economy in expenditure	50	75	44	57
Total (A+B+C)	357	807	311	410

(iii) The share of IMFL in states total excise revenue is very high for Andhra Pradesh and Tamil Nadu.

(iv) The share of country spirit in states total excise revenue is very high for Karnataka (74 per cent) and Kerala (67 per cent).

(v) In all the four southern states, revenue from country fermented liquor and malt liquor is very low, which are relatively of lower alcohol content.

(vi) Revenue from AHC in all southern states except Andhra Pradesh is showing an upward trend. However, in the case of Andhra Pradesh there is a steep rise in the excise revenue from IMFL.

(vii) There is steep increase in excise revenue from country spirit in Kerala while the corresponding increase for IMFL is relatively low.

All the four southern states are showing a growing dependence on excise revenue from AHC. This obviously implies that the normative or ethical aspects of revenue mobilisation is given only a secondary importance as compared to the economic rationale. A reduced dependence on this

source of revenue may have the welfare effect of improving the health, productivity, savings, income and standard of living of labour. In fact the improved health due to lower alcohol consumption would reduce government expenditure on health in general and particularly for alcohol-related health disorders. The saving in health expenditure and overall improvement in income and welfare through prohibition may have to be quantified for weighing against the final revenue loss from prohibition so as to estimate the net effect of prohibition on budget. Such a welfare cost/benefit analysis though difficult can act as a valuable guideline to policy on prohibition. This issue further confirms that positive and normative economics is closely interlinked and also that the conclusions of economic decisions need to be strongly grounded on moral commitments to public policy, so as to reconcile economic targets without jeopardising ethical and moral targets.

[The views expressed here are those of the author and not of the organisation to which the author belongs.]

is a mere private affair, extravagance and disturbance to the daily routine of the population living in the suburb where the function was performed are only of relative significance. After all even the simplest marriage performed in a narrow Mylapore lane has elements of extravagant waste and some inconvenience to the public.

The undeniable fact is that the wedding was not a private matter. The sheer scale of operations should indicate that it was not intended as such. Again it would be an incorrect assessment to treat the occasion as an aberrant act of the individuals concerned. The bride's father — being a mere salaried professor — could not have mounted such a gala affair even granting that an indulgent (admittedly more prosperous) maternal grandfather subsidised the event. The fact that bulk of the organisation was in the hands of the groom's foster mother and aunt, and they being key figures in Tamil Nadu politics tells its own tale.

There is no denying that it was an event of the times we are in at present. In these days when everything has a political dimension and use, it would be too much to expect our political operators not to use the occasion. Indeed the socio-political utilisation of marriage platforms is nothing new. In the reformed self-respect marriages which became common after India's freedom, the part played by 'purolaitis' performing religious rituals was more or less taken over by senior political figures who presided over and participated in the ceremony giving elaborate speeches about the current political and social situation. It almost always bordered on political propaganda.

The available evidence indicates that the ruling AIADMK with only a few months to go for the general election is beaming a few strategic signals to its own faithful flock as well as to its political opponents through this mammoth affair. First, the incongruity of a member born in the caste that was at the receiving end of the ideological war waged by the Dravidian movement since the early days being the general secretary and chief minister needed a firm correction. This is especially when the state government is in a Catch-22 situation regarding the reservation issue. Was there any way for the party supremo to identify herself with her constituents most of whom belong to the backward and dalit castes? As there is no legal way to convert to another caste, the only course open was to adopt a child from those very castes to announce that the leader was being truly faithful to the ideology of the Dravidian movement. How can then anybody doubt her bona fides when she vociferously champions social justice? It was not a nominal adoption and the wide world had to be shown that she

TAMIL NADU

Politics of Wedding and Wedding as Politics

S Ambirajan

While the marriage of the foster son of the AIADMK supremo and Tamil Nadu chief minister has been widely, and rightly, criticised for its ostentation and vulgarity, what has not received as much attention is that, with but a few months to go for the general election, the AIADMK was beaming a few strategic signals to its faithful folk and to its political opponents through this mammoth affair.

THE recently consummated marriage of the foster son of AIADMK supremo and chief minister of Tamil Nadu was certainly the most written about and much discussed event of that genre in recent months. Both before and after the day of the holy matrimony, much frenetic activity took place in the courts, streets, and elsewhere in Madras. There have been other mega weddings performed by politicians, businessmen and princes, but this particular wedlock seems to have outdone all of them in terms of opulence, vulgarity, ostentation and of course controversy. The event itself came in for a good deal of adverse comment from a large number of concerned citizens of Madras, and rightly so. But a lot of condemnation in the popular press lost its effectiveness because of the exaggeration of the misdemeanours. Prior to the event, there

were rumours about 4,000 goats kept ready to be slaughtered for making 'mutton biryani', 101 caparisoned elephants to be brought from Kerala to accompany the wedding procession, a helicopter arranged to shower flower petals on the couple, etc. But when these didn't materialise, it led to the speculation that even the quite valid and legitimate criticisms were without foundation. Even the large plates with sarees and invitation cards given to the VIP invitees were found to be silver plated and not pure silver as it was claimed in some newspapers. Truth was had enough without any need for imaginary embellishments.

In any case, to treat this wedding as a private affair and castigate it for its tasteless display of wealth is to miss the whole point of the exercise. Once it is accepted that it

is a doting mother who will deny nothing to make the son happy.

The second signal is to show the party members that AIADMK is 'one big family'. While other party bosses have performed weddings, this one was unique as every single AIADMK member was invited to participate with appropriate provision made for their stay in Madras. The message intended to be conveyed seems to be that while in other parties the party was controlled by the family, in AIADMK it is the party that makes the family. The blurring of the lines between a private function and a party palaver seems to be deliberate and carefully orchestrated. The third signal was to indicate that the present AIADMK is virtually invincible. The marriage was nothing short of a massive show of strength. There has been quite a few allegations of corruption, high-handedness and other acts of commission and omission by the present regime. The enquiry committees, cases hanging fire in the courts, relentless pursuit by gadfly politicians and the enforcement directorate and so on had given rise to a feeling that perhaps the superno is afraid of defensive or too weak to face the charges. This exhibition of openness and even conviviality with both the party people and outside dignitaries was intended to help dispel the suspicion that the leader is running scared.

Sending signals through symbols have been key elements in the way Indian democracy has been practised. In a largely illiterate and semi-literate population, one has to take recourse to a discourse other than the coldly rational and reasoned prose. In any case, symbols have always been important in the Indian cultural ethos as a communication medium. While the Congress and more so the Dravidian movement, notably DMK under C. N. Annadurai and M. Karunanidhi, used symbols from the past history of Tamils to convey political messages effectively, they were also handicapped in going whole hog by their commitment to certain aspects of a modernist ideology associated with the Mahatma and the Periyar.

During the last decade and half, the modernist ideology which stirred an earlier generation is very much in decline. Even during their lifetime, both Gandhi and EVR saw their followers jettison important aspects of their teachings in their search for political power. Once in the seats of administration, numerous compulsions eroded their former commitment to principles, and they compromised easily. In South India, for example, EVR's key principles such as (a) anti-aryan/brahmin/north Indian hegemony; (b) rationalism that shunned religion, language, and other emotional issues; and (c) social reform that

stressed eradication of caste, greater gender equality, better redistribution of income/opportunities, and simple unostentatious living, have all more or less been diluted in very different ways. These ideals have either been abandoned or turned on their head to subserve the political and economic interests of powerful groups in the society. Other institutional and attitudinal changes coupled with current international trends have contributed to the weakening of the hold of old values and ideals in the minds of people.

The overall result has been a steady deterioration in our political culture. A macabre manifestation of this is the increasing monarchisation of the democratic polity. Regal symbols like presentation of gold/silver decorated swords, setting ornate crowns, and transferring the sceptre from

the leader to the chosen heir are continuously employed by political leaders to impress the citizens. Similarly the vocabulary prevalent in Indian political articulation is thick with militaristic and regal phraseology. We must also remind ourselves that marriages have been utilised since times immemorial as political instruments by ambitious rulers.

Over a period, such monarchic symbols, practices and sentiments have entered the soul of our democratic process through dynastic succession and absolute powers acquired by the elected leaders. The present marriage resonating a royal flavour with all the pomp and pageantry that would have done a Chola or Pallava emperor proud is but yet another step in the descent towards a *de facto* monarchical form of government.

Development and Displacement

National Rehabilitation Policy

D C Sah

The National Policy for Resettlement and Rehabilitation in its present form is based on a premise which sees displacement only as an appendix to development. What we need in its place is a development model which deals with displacement as an integral part of the process

AT present at least two drafts of policy document for Resettlement and Rehabilitation (R and R) prepared by the ministry of rural development, government of India, are under circulation. This note has two main objectives - to place the issue of displacement within the model of Indian development, and to identify missing links in the drafts which may eventually emerge as constraints in evolving a successful policy frame.

I Development Paradigm

It has been argued that alienation, deprivation and inequality are inherent in the strategy of Indian development. Independent India inherited an economy pervasive of intense poverty. Agricultural production was stagnating and productivity falling [Pryn 1982]. The industrial sector was small and its traditional manufacturing and trade was stunted. Moreover, the trade and infrastructure was designed to feed its colonial interests. Modern industry was discouraged and the regime flooded the Indian market with low cost industrial goods which further depressed indigenous industry. The capability of the industry to absorb the workforce was marginal. Reduced death rates and increased pressure from a growing population fragmented the land and landless class increased rapidly. The system of collection of agricultural tax reinforced these tendencies. Consequently, the dominant sector of country, the agriculture, was characterised by massive mass of labour-force tilling small and fragmented plots with seed varieties just capable to feed its growing population.

This scenario was responsible for a desire and hence choice of development strategy in India. A few other factors also influenced the choice. First, false optimism with respect to capabilities of agriculture originated due to good rainfall and achievement of low targets fixed during 1951-56. Second, structural constraints of agriculture were misidentified as 'slack' between average and higher levels of yields that some farmers have achieved [GOI 1959] - it was wrongly

presumed that the 'slack' was due to inadequacy of supplies and ways to use it. Lastly, the tendency to equate modernisation with industrialisation.

The debate over the development strategy after independence was guided by these considerations. The prime need before the country was to 'accelerate the rate of material capital formation'. The limiting factor in this regard was low saving. It was argued that shortage of saving is mirrored in the inadequacy of production of capital goods. And thus came the Mahalanobis plan which considered source of growth was capital goods and the means of growth were allocation of resources for their acquisition. The more resources so allocated, the faster production capacity would grow. The basic premise in the strategy was that a rapid sustained growth would trickle down and bring distributive justice. But the growth remained too small to trickle down.

The situation further deteriorated with respect to distributive justice when second generation problems of new agricultural technology started emerging after 1970s. The new agricultural strategy created islands of prosperity amidst mass of poverty. Inequality across people and across locations intensified. Marginal farmers and landless labourers were losers and so were the areas which remained outside the purview of new agricultural technology. The lopsided investment in research and development between irrigated and dry farming technology affected adversely the tribals who depended on dry farming. This capital-intensive approach resulted in inequality and concentration on the one hand and insensitivity and violent social disruption on the other.

Large dams in India are no exception to this; it is estimated that owing to construction of over 1,500 major development projects since independence, over 20 million people were displaced from their habitat, about 40 per cent of this displacement belongs to tribal population. In a democratic set-up such involuntary migration is considered infringement of the right of people but we, in India, have treated this trauma very casually.

Viewing the R and R against this backdrop, there are many positive features in the Modified Draft National Policy for R and R (MDNP). It is heartening to note that MDNP recognises not only the ecological disequilibrium created due to submergence but also the human misery it brings on account of involuntary migration.

sites of these projects are located in remote and backward areas and then construction leads to submergence of substantial flora and fauna and home and hearts of people who are economically, socially and otherwise backward (MDNP 1).

Having recognised the need of R and R for those who suffer the consequence of development, the draft however fails to make appropriate efforts to evaluate the social and human cost of development. As a result instead of alternatives being evaluated what is highlighted is

one of the preconditions for the approval of any project should be a strict assessment of the land requirements of the project with a view to keeping the land acquisition to the minimum so that involuntary displacement is minimised (ibid).

Planning development projects with sensitivity, needs establishing strong linkages with processes and the institutions which identify and address the disequilibrium created by the projects. First, development has a hidden ecological, social and human cost which is paid by the people residing near the project site. This cost has to be minimised through an appropriate policy instrument. Amongst the alternatives the project which minimises this cost maximally, while at the same time keeping the benefits intact should be the project best suited for the area. The MDNP does not provide for re-evaluating projects for such planning failures. Alternatives for minimising these miseries associated with development remain unevaluated mainly because the state by and large remains unresponsive to them, while the critiques lack data on putting forth such alternatives. The state's unwillingness to share data and information, apart from political expediency, is also responsible for lack of alternate designs. Easy access to information would help in evaluating various options.

Not totally disassociated from displacement, development projects with least displacement and minimal ecological disequilibrium requires a thorough understanding of alternative project designs. This is a gigantic task and should be the responsibility of the planning institution. The R and R as a policy, however, can only be accepted if alternative projects are evaluated and their benefits and costs (including ecological and social costs) are elaborately spelled out at the planning stage.

Secondly, lack of provisions in project design to monitor second generation

environmental problems and their remedial measures render the projects non-functional, for such problems become threats to environment and the people. This happens over a time especially when no specific organisation has been made responsible for providing remedial measures to such ills. Such a measure would not only compel the planners to identify second generation environmental problems to the maximum extent at the planning stage, but would also call for fund allocation in order to respond to such problems as and when they arise. Another way to tackle these problems can be through the creation of a fund by imposing irrigation cess on the beneficiary farmers in the command area. This fund may eventually be utilised to tackle second generation ecological problems created by the project.

Lastly, in the prevalent paradigm of development, market plays an important role. Resettlers who are mainly tribals are unfamiliar with such market forces and mechanisms and remain alienated from these processes primarily because they are not able to obey its working rules. Consequently they end up bearing a variety of associated costs without benefiting from it. This increases economic inequality between host and new settlers. The provisions necessary for such economic integration is also missing from the present MDNP.

Development has been so isolated from displacement in the present MDNP that these issues are not even recognised. What is herefore needed is a development policy where displacement and rehabilitation become parts of the policy frame.

One of the most controversial portion of the MDNP is a section on acquisition of land. This is so because the MDNP confers the sole right to the state to fix the price of land. The draft even extends in empowering the state further.

Acquisition of land for public purpose and consequential payment of compensation under various state and central laws should be brought in harmony with the provisions of the Land Acquisition Act 1894 as amended in 1984. The state should fix a categorywise price of land in respect of tribal lands based on capitalised value of productivity of previous ten years (MDNP 10).

Once this mode of acquisition is accepted, subjectivity in price fixing becomes inevitable. Tribal groups often residing in remote undulating areas maintain themselves under a low yield equilibrium. The low yields are compensated by cultivating larger area through encroachment of forest land. So with low yield and small size of owned land, the MDNP procedure of compensating by quality based pricing of land would bring not only subjectivity but also meagre compensation to the project affected peoples (PAPs). Instead of this procedure, 'land for and' may be accepted as a norm for

compensating for the loss of land because of submergence. This would reduce the ambiguities creeping in because of issues of quality of land and its alternative use. In order to accommodate non-agriculturist households and oustees who do not want land-based compensation, the R and R policy should be broad based. Provision should be made in the policy document to accommodate other modes of compensation and formation of institutions for carrying out evaluations for non-land based compensation.

Use of the term land for public purpose (p 10) is also unacceptable for it makes mandatory for displaced people to abide the state decree even if such acquisitions are being made on behalf of industry or private parties. Hence, the term 'public purposes' should be defined clearly before using it in the draft.

CORE PROVISIONS MISSING LINKS

While defining the project-affected family the MDNP brings in a gender bias.

Every major family member dependent upon landholding jointly or separately should be considered as a separate family unit for all purposes of land allotment. The title right will be no alienable (p 16).

While interpreting 'member dependent on land', unmarried women, widows and divorcees need to be identified as members. This is just not a question of justice and equality, but also reflects the attitude of policy-makers towards the needs and participation of women. This attitude further manifests in the form of ignoring the gender perspective in choosing relocation sites, selection of sites for house plot, locating drinking water sources (pumps and wells) in the new sites, et cetera. In a tribal society, female participation in day-to-day decision-making and in economic activity is equal to male. Patriarchal norms of non-tribal society restrict mutual decision-making. Revisions recognising women's need and concerns, and ensuring their participation in decision-making have to be incorporated in the MDNP. In fact, the relocation and rehabilitation must be recognised as a participatory process and this must be realised by policy-makers through appropriate and effective interventions.

Experience has shown that well-intended policy statements remain unimplemented owing to failure in identifying instruments for their execution. The MDNP also lacks necessary linkages that make such policy implementable. For example with respect to land rights of the PAPs, and their cultural losses the draft says:

Land to be allotted for agricultural and residential purposes to the project affected (peoples) should be free from encumbrance (p 16)

or

All right and entitlements of the displaced and project affected people must be enforced through courts of law (p 12).

or

Whenever whole village, slum localities neighbourhood, and communities are uprooted there is total disturbance of structure and network of social relationship which support an ethos and a way of life. Any plan of resettlement should be sensitive to this loss and should aim at providing for the recreation of a community ethos and a way of life (p 9).

There are many other instances. For example relationship between the host and the resettled households (pp 12 and 20), providing financial assistance to PAPs (p 19), organising PAPs in co-operatives (p 21), etc. Almost always all these are well intended concerns but have emerged as rhetoric that clearly lack the necessary institutional arrangements for their implementation. If a committee looks into these issues, its scope of functioning needs to be spelled out in MDNP itself. And thus, when land rights are being discussed in MDNP, the issues like checking (a) the size of land, (b) if canal, road, or any other project is not on the land allotted to a PAP, (c) if the same land which was shown to PAP has been allotted to him, (d) for encumbrance on it, (e) if right of minor in the father's property clashes with the rights of major sons have remained outside the purview of the present MDNP. This creates ambiguity in the minds of the PAPs and creates uncertainty about their status as landholders. Therefore, identification of institutions which shall carry out such verifications cannot be overemphasised. Similarly, when PAPs are to be relocated as a community, some of the immovable cultural complexes have to be reconstructed at new sites. Help of qualified social scientist must be made in-built at the planning stage. The MDNP must accommodate these issues and processes through which these aspects can be institutionalised.

On the subject of providing for amenities at the relocation sites, the MDNP states that water supply for drinking and cattle, fodder and grazing land, schools, approach roads, electricity connection, health centres, religious places, cemeteries and graveyards, panchayat house, etc. should be made available.

Each resettlement site should be provided with a reasonable and adequate community facility as under (p 19)

More often, these facilities are linked to a minimum number of relocated families. The relocation processes, as experience has proved, do not always have the minimum number of specified families required for the provision of a particular service at a new site. This easily leads to non-compliance in

providing these amenities. To avoid this situation the paragraph above should read as follows: "Each resettlement site, irrespective of the number of relocated households, should be provided with reasonable and adequate community facilities as under".

Moreover, the MDNP states:

Resettlement must provide for an improved resource base so that the displaced in their new place can have access to not only shelter but also food and income generation systems, communications and social infrastructure not inferior to that of their original habitat (p 11)

It proclaims the need to maintain or improve the living standard of relocated PAPs at the new sites compared to their condition before submergence. But again the draft falls short of providing the necessary linkages. Similar is the case of conducting bench-mark studies in the submerging villages (p 7). Both, the bench-mark study and its comparison with the situation at the relocated sites are specialised and sensitive tasks, for the success of the R and R policy rests largely upon improving the well-being of the PAPs. An unmonitored or partisan monitoring may be harmful to the proper realisation of an effective R and R. This monitoring, thus, has to be undertaken only by an independent agency which not only has a specialisation in dealing with such issues, but also sensitivity towards poor oustees and host groups.

PLANNING RELOCATION

The MDNP has subdivided the implementation plan into a relocation and a resettlement plan (pp 13-14). In doing so, it has disassociated the relocation process with that of the project construction. The MDNP says that:

The entire plan for resettlement should be ready and sanctioned by the Project Authorities through especially established participatory decision-making structure involving PAPs at least one year before the start of any action for land acquisition or resettlement (p 10)

But the draft nowhere specifies the time lag between construction and rehabilitation. In the process, as experience has shown, relocation takes place simultaneously with submergence. This is referred as *pari passu*. The problem with *pari passu* is that project authorities turn indifferent to the needs of PAPs as time passes. But *pari passu* clause cannot be avoided. Thus, a project should commence only after ensuring equal treatment and package to early as well as late resettlers.

The early years of relocation are of extreme hardship to the oustees owing to the breaking-up of the usual informal structures of

submerging villages. To mitigate this hardship, the relocated households should have cultivation rights till submergence commences without restoring to an official sanction. This economic support may ease hardship associated with early shocks of relocation. Also, the process of acquiring land in the command area for relocated PAPs should be complete, before the commencement of the project. Though, to some extent, this will restrict the choice of site for resettlement by the oustees, it will smoothen the planning of relocation process.

When MDNP states:

Tribal community should be strictly settled in the area of their choice. They should be enabled to exercise their choice by furnishing them with full information regarding the resettlement sites and providing opportunity for physical inspection (p 20).

This is an ambiguous statement empowering the state to break the social fabric associated with village, peer group and family.

The relocation process could be seen from two different dimensions; first, the traditional social links and economic institutions at the submerging villages had an important place in the life of oustees. These arrangements had helped in the sustenance of the society in the submerging villages. The randomness of relocation and the absence of the traditional arrangements at the new sites could make the oustees vulnerable to exploitation. The other dimension to the process is the appropriateness of the existing policy. People associated with resettling the oustees may defend the policy and the process by reiterating that the decision of shifting is an individual decision. The argument gains strength from the fact that the village is not a homogeneous unit; even in a 'phalia' the people do not always want to shift together. And since the oustees may be shown land in different locations, their moving to the new sites is voluntary, for oustees have preferred the land they want to cultivate in the new sites. The argument could have been accepted were there some method of avoiding the randomness of the relocation.

It may be argued that the MDNP provides avenues and instrument of choosing the new site. The fact is oustees certainly may have a choice — to choose best amongst the worst. Thus migration in absence of proper social and economic arrangements may not only be involuntary but also an outcome of policy frame incapable of safeguarding the risk of social disruption. This, as will be shown in the next section, is what can be termed the weak policy frame.

Rehabilitation of involuntary migrants, like poverty alleviation, is tantalising. The task gets further complicated because policy-makers equate standard of living with the level of income and consumption.

Rehabilitation of dam affected people is much more than this. The process demands concentrated efforts to improve abilities of oustees so that the productive resources provided to them are economically exploited to their full potential. This could happen when access or entitlement of social and economic services are converted into abilities of affected people.

In order to sustain the level of living when resettlement accompanies (a) broken fabrics of society because of randomness of household movement, and (b) drastically changed economic environment, rehabilitation policy has to be flexible and respond to emerging demands. It may be recognised that socio-economic infrastructure may be denied to oustees in their new environment. Therefore, efforts will be needed to ensure smooth transition from barter-exchange based system to a monetised-market based economy in which oustees will have to function. Otherwise, households adjusted to mutual exchange, and non-monetised economy would find themselves the centre of economic exploitation in a competitive market economy. When norms of social exchange are replaced by market all of a sudden, the displaced section of society may need support to (i) visualise and get adjusted to the markets; (ii) have enough resources and information as to become active participant in the technologically dynamic agriculture, and (iii) convert entitlement of social and economic infrastructure to people's capabilities [CSS: M and Report 15].

Instead of identifying impoverishment risk, all what the MDNP has to say is:

A well designed plan for providing advice, assistance and other help to those displaced by a body of experts from different fields must also be prepared and implemented (p 19)

The above statement is ambiguous on many counts: for one the purpose for such planning is not clear, for other the fields on which these plans are to be prepared is not clear. The MDNP should have explored the processes responsible for failure to rehabilitate the PAPs.

Land to the oustees at best is a first step towards their rehabilitation. What is required is to enable them to make productive use of this resource. This would involve institutional support in terms of motivation, education, skill development and information, and risk sharing. Entitlement of social services like health services, education, water and sanitation and economic infrastructure like extension support, credit facilities and input-output markets, gets automatically converted into abilities of people only in normal circumstances. But involuntary migration is not a normal situation, more so if it involves tribal

It has been argued [Wood 1993] that in order to feed its rapidly growing population, India may have to continue with big dams albeit with caution. This caution is needed much more at the stage of rehabilitation. Although, sufficiently improved over the R and R package available till date to any development project, the MDNP may barely succeed in relocating PAPs; many of the risks associated with rehabilitation of involuntary migrants may still slip in. Evidence shows that the PAPs are vulnerable to a number of risks. For example: low technology adoption and fluctuating yields [CSS: M and E Report 19]; social disruption due to fragmentation of farms and family [CSS: M and E Report 16]; access to food [CSS: M and E Report 19]; investment risk [CSS: M and E Report 20]. The following risks which lead to loss in standard of living need to be avoided through appropriate policy frame: Family fragmentation, fragmentation of land, differential access to market, investment risk, information risk, technology stagnation, yield risk and access to food.

The first two are associated with resettlement planning and the next four with failure to recognise that a vulnerable group even in advanced downstream locations could face lack of access to market, information and technology. The last two are the consequences of the preceding risks. Cernea (1990) has argued that the absence of interrelated policy frameworks increases the adverse impact of displacement. It would thus be worthwhile to understand the basic lacuna giving rise to these risks.

R and R within the frame of the existing MDNP is likely to take place in a manner where the social, cultural and economic support from within may be disturbed while the institutional arrangements from outside still not reach the PAPs. To avoid family fragmentation, the first requisite is to bring in legislation an act to ensure that land cannot be acquired in the submerging villages until land in new sites has been identified and allocated to oustees in a group. Moreover, if available land at new sites is not cleared for encumbrance and future development of road, canal, etc, land fragmentation cannot be avoided. Similarly, land to major sons, kin and peer group and neighbours has to be planned well in advance and with the given priority to mitigate social disruption, family and land fragmentation. Thus the basic failure at the policy level is lack of legal protection to oustees.

Experiences of monitoring of R and R of people affected by Narmada reveals that the compensation package treats the oustees as one whose main need is immediate relief. The R and R did not consider that the oustees are familiar with a different production system. To plan for economic integration of

oustees with the mainstream economy, it is desirable to distinguish between relocation and rehabilitation. For the second generation problems of resettlement like access to market and technology, yield risk and access failure to food, need a different treatment than the usual development department approach.

The oustees by and large being tribal have to deal with the agricultural production system of the new site which is technologically different. The institutional set-up for input delivery especially water, credit and output marketing on the one hand, and institutions responsible for dissemination of production techniques on the other are geared to deal with a more receptive host community. Access to these institutions may not be automatic for new settlers. Moreover, asking host farmers to share their resources without augmenting them results in depletion of resources and disruption of social harmony between oustees and host communities.

Thus the basic failure at the existing MDNP is its over-confidence on the organisational capabilities to respond to rehabilitation problems. Organisational set-up responsible for economic integration and for tackling second generation rehabilitation adjustment may involve NGOs, agricultural department and the monitoring agency. This may be a suitable alternative for making R and R operationally more successful. But it should be noted that NGOs who are involved in relocation of the PAPs may be too deeply committed to provide enough time to the process 'rehabilitation'.

Experience has reconfirmed that a comprehensive policy framework is inevitable if impoverishment risks have to be avoided. Even after doing so, it is likely that emerging impoverishment risks warrant revisions. Sensitive societies dealing with involuntary migration will have to make room for such periodic revisions. Recognition by policy-makers that these are potential risks is the first step avoiding the risk. A policy frame having provisions first to identify the impoverishment risks associated with resettlement and that of counteracting them is needed for rehabilitation.

[The author has benefited from discussion with Seema Bhaskaran, Lancy Lobo, Biswaroop Das, Ghanshyam Shah and participants of a workshop organised by Centre of Social Studies, Surat to discuss the National Policy for Resettlement and Rehabilitation]

Elections in Latin America

Near Collapse of Party Rule

Girish Kumar

Since late 1980s, voters in Latin American countries have opted for responsive and active presidents who would provide instant solutions to their pressing problems, notwithstanding the methods they adopt for the purpose.

DURING the last few months, presidential elections have been held in Peru and Argentina and in both these Latin American countries the incumbents have won a second term – Alberto Fujimori in Peru and Carlos Menem in Argentina. By winning two consecutive elections, obviously, they have set a record in the postwar electoral history of Latin America. Interestingly enough, when they had entered the office for the first time they were hardly known in political circles of their respective capitals of Lima and Buenos Aires. Even the way they rode to the presidential chairs was in itself puzzling, if not baffling.

Menem was, no doubt, a provincial politician belonging to the Justicialist (popularly known as Peronists) party but he was far away from the elite political circles of Buenos Aires, whereas Fujimori, an agronomist by training and profession, by any stretch of imagination was not a politician even. In fact, Fujimori had hardly any political party worth the name to support his candidature when he ran for the 1991 presidential race.

No wonder, during their first term they had displayed little respect, if not total disregard, for the constitutional norms while presiding over the destiny of their respective countries. Menem not only put his party's avowed politics upside down – deregulation and privatisation of the state controlled economy, which had until recently been the hallmark of Peronism – but he also preferred very often to rule by the decrees than taking the senate into confidence. Fujimori went a step ahead and assumed emergency powers to rule, keeping the congress in a state of suspended animation from April 1992 to January 1993, during which he got the constitution altered to arm himself with enhanced executive powers.

Yet the electorates have re-elected them. Fujimori got a record 64 per cent votes, nearly three times more than what his nearest rival Javier Perez de Cuellar, former UN secretary-general, could secure in the election held in April this year. Menem bagged 49 per cent votes in the presidential election

held in May. Little wonder, Fujimori has equated his victory with an end to the partidocracia (party-rule) (*The Economist*, April 15, 1995). Now, if Fujimori is to be believed, the political parties have no role to play in the new model of democracy in Peru.

To say that an executive president does not require a party, not even for the sake of contesting elections is an eloquent testimony of the dwindling fortunes of political parties in Peru, at least in terms of their reach and impact on electorate at large. Howsoever bizarre it may sound, but this is precisely what is happening not only in Peru but in many other Latin American countries. The results of presidential elections since mid-1980s testify to this fact.

CHANGING PERCEPTION OF VOTERS

In fact, putting aside this well established pattern of (presidential) election, a different trend has of late emerged in Latin America where individuals, not necessarily politicians, have appeared from nowhere and ironically, with one man force to begin with, have made their way to presidency. No doubt, the Latin American history is dotted with the rule of caudillos (the strongmen) who had captured power by brute force. In contrast, the new generation of caudillos are lesser known politicians or professionals whom people have willingly voted to power.

It is worth recalling here that since the restoration of formal democracy in the early 1980s, after two decades of dictatorship, the elected neo-democrats in Latin America are finding it hard to cope with the changed circumstances. They have had to confront the problem of servicing huge external debt left behind by their predecessors (mostly in uniforms) and to push through painful economic reforms – a precondition to secure the IMF's assistance for rescheduling of debt payments. Not being able to strike a balance between these market-led economic reforms and the imperatives of a welfare state, most of the established political parties in Latin America are fast losing their popular appeal. Not that the people were happy with

the welfare measures. There was large-scale misappropriation of state resources by corrupt bureaucrats and politicians; the half-hearted economic reforms have added to their miseries.

No wonder, the voters have started turning to outsiders in politics, either obscure politicians or professionals who defy the traditional, stereotype image of big city politicians. Gone are the days of 1960s and 1970s, even early 1980s, when people used to demand nothing but freedom and liberty from the clutches of military rule. Since late 1980s, they have started looking for a responsive and active president who could provide instant solutions to their pressing problems, mainly price rise and inflation — thanks to worsening economic conditions of masses — notwithstanding the methods he adopts for the purpose. It is this change in the perception of the voters which has decisively influenced the outcome of the elections held in recent past. With its devastating visual power, the electronic media has played its own bit in selling (like that of detergents or painkillers) the charisma of these self-professed saviours.

Carlos Menem of Argentina was the first 'outsider' to win the 1988 presidential election. Prior to that he was the governor of a remote province, La Rioja and was hardly known in Buenos Aires. During the regime of his predecessor, Raul Alfonsín of the Radical Civic Union Party, the country was ravaged by political conflicts following the collapse of the military dictatorship in 1982 and economic instability. In fact, the Argentine scene was so chaotic that Alfonsín had stepped down six months prior to the end of his term. It provided an ideal ground for Menem to promise tough measures he would apply if he was elected and he won.

Similarly, Fernando Collor de Mello was also a governor of an obscure province 'Alagoas' in the north-east of Brazil. He won the first direct presidential election in 1989, which was held after two decades of military rule, by promising a clean government. In his campaign, with the support of a hurriedly formed group which was not at all a party in a proper sense, not only did he deplore the economic mess in which Brazil had been pushed but also claimed to have fought corruption in Alagoas. With his charming personality, aided and abetted by TV projections, and an unknown past, he defeated powerful politicians of long-standing. Ironically, he was found involved in financial scandals subsequently and was forced to resign mid-way.

Brazil has numerous political parties but whom its voters choose again in the last presidential election held in October 1994?

He is Fernando Henrique Cardoso, an economist recently turned senator (who also served as finance minister during 1993-94) who could not name his own party in his bulky election manifesto running into 300-odd pages. Yet, he won with 54 per cent of votes polled.

Carlos Palenque of Bolivia represented another extreme as he really came from nowhere in politics. The owner of a big television station, this benevolent affluent businessman of Lapaz had earned kudos by doling out food packets, rendering legal assistance and medical aid to slum dwellers. With these credentials of a philanthropist he jumped in the presidential race in 1989, though he stood fourth with 18 per cent votes. Since no candidate had secured majority vote in that election, the Congress ultimately elected (as per the Bolivian constitution) Jaime Paz Zamora of the Movement of Revolutionary Left (MIR) party, who had stood third in the race with 19.64 per cent votes (*The Economist*, August 12, 1989) as the president. It also needs mentioning here that Zamora, a former guerrilla leader, happens to be an established trade union leader and his party MIR has

sizeable influence among tin miners.

To cap it all, Alberto Fujimori, was also a rank outsider who got into the presidential chair. The son of Japanese immigrants and trained as an agronomist, Fujimori also used to play a host in a television talk-show programme on farming. Incidentally, the man whom Fujimori defeated in the 1989 presidential election was also an outsider but no less a person than Mario Vargas Llosa, an internationally acclaimed literati.

These non-traditional presidential aspirants were, however, pitted against the candidate of the ruling party, APRA, one of the oldest and highly organised political parties in Peru. But their being professionals, not politicians, proved to be a great asset. For, the voters were already disillusioned with the traditional political order, represented by both the ruling APRA and its left allies and the opposition parties like the Popular Action and the Christian Popular party. But what finally clinched the issue in Fujimori's favour was his sheer electoral chicanery.

His main rival, Mario, the novelist, had all along been describing imaginary events and people in his novels but in the (real)

election battle he turned out to be forthright. He campaigned for a radical departure from the past policies and emphasised the necessity of painful economic reforms. Fujimori, on the other hand, also talked about change but without pain. He did not bother to explain how without dislocation of the economy such a change could be brought about.

Mark Malloch Brown, a British media consultant who had been engaged by Mario for his publicity work, wrote later (*Granta*, Summer 1991) that in the war of images projected by television, Fujimori had an edge over the novelist. Fujimori was vague in defining his agenda for the change but he was consistent in hammering at the theme, which is a must in political communication. On the other hand, Mario was brilliant in defining an issue or a policy but he went on chasing even mundane issues of the day with the result that his 'message got lost in the instant comment or the spontaneous TV spot'.

TEDIOUS PROBLEMS

When Fujimori took over in 1990 he inherited an almost impoverished state:

HOUSING, SUSTAINABLE DEVELOPMENT AND THE RURAL POOR

A Study of Tamil Nadu
BERNHARD GLAESER

Based on a case-study of Tamil Nadu, this empirical work examines efforts to improve housing technology for the poorer inhabitants of rural areas, keeping in view the social, environmental and technical aspects. The habitat concept used by the author treats housing and issues related to the household as parts of twin systems - the environmental and the social. Breaking new ground, this book will appeal to a wide readership including those interested in rural housing, appropriate technology, sustainable development, environmental issues, sociology and human ecology.

1995 ■ 436 pages ■ Rs 465 (cloth)

In an incisive comparison of rural development in India and the United States, John Echeverri-Gent sheds new light on the dynamics of state-society relations. Based on extensive fieldwork in India and archival research in the U.S. National Archives, **The State and the Poor** investigates the implementation of rural poverty programs by rural development agencies in Maharashtra and West Bengal and by the Resettlement Administration and Farm Security Administration during the American New Deal.

1995 ■ 348 pages ■ Rs 550 (cloth)

nearly 30 per cent of the export earning was going on serving a huge \$ 22 billion external debt and there was a chronic balance of payment problem, the annual rate of inflation had soared to 7,649 per cent which, in turn, had fuelled spiralling price-rise. Besides, the government had no money for the subsidies in the agricultural sector and to run its subsidised essential services in cities and towns. To cap it all, the country had been ravaged by a nine-year old bloody guerrilla war and nearly 25,000 persons (total population 23 million) had already died in the fight between the armed forces and the guerrillas of the shining path.

Fujimori blamed the partidocracria for all the ills of Peru and during his first two years as president, he frequently used his 'veto' power to overrule the congressional objections to his free market policies and his ways to deal with the insurgency problem. It is interesting to note that during his election campaign Fujimori had denounced the free market policies of his rival, but he was quick to adopt the liberalisation policies — basically a mixture of free market, privatisation and fiscal austerity — once he came to power.

Argentina was equally plagued with an external debt (\$63 billion), and on its services alone it was spending nearly 30 per cent of its export earnings. The inflation was also running into four digits and the Argentines were severely hit by skyrocketing prices. The only noticeable difference between the two was that unlike Peru, Argentina was free from insurgency, though Buenos Aires and some other cities had witnessed political conflicts over several issues, including granting of amnesty to the guilty army officers who were responsible for the disappearance (read murder) of nearly 15,000 opponents of the military dictatorship during 1976-1982.

Through economic reforms and fiscal austerity measures both, Fujimori and Menem, managed to tame hyperinflation, bringing the inflation rate down from four digits to as low as one digit (Argentina's current 4 per cent inflation rate is the lowest in Latin America) and check spiralling price-rise. To achieve this economic stability, both of them pursued the same strategy: liberalisation of economy, privatisation of chronically inefficient public sector, drastic reduction in tariffs and subsidies as well as in the fiscal deficits coupled with massive induction of foreign investment.

Fujimori also came down heavily on the insurgents of the 'shining path' and with the arrest of its most secretive leader, Ambiel Guzman, he succeeded in breaking

the backbone of this widespread underground organisation and earned kudos from common Peruvians who were fed up with the senseless violence it indulged in. For all this, however, he had relied upon military and in exchange of its unflinching support to his authoritarian rule, he had turned a blind eye to the corruption in its ranks as well as their collusion with drug traffickers. In fact, on election eve early this year he promised to involve military in other spheres such as construction of schools, bridges, etc. He has already given a free hand to the army in the trial of drug and subversion-related cases. Similarly, Menem has bought peace with the army by giving amnesty to the military officers who had been held responsible for the disappearance of thousand of people.

Despite achieving economic stability, both Argentina and Peru are facing serious social dislocation which is by-product of the economic reforms. Due to the structural adjustment measures taken to stabilise the economy, nearly 10 million Peruvians have been pushed into a state of extreme poverty, half of them living in the shanty towns of Lima alone. The real wages of the industrial workers have plummeted by 60 per cent as compared to 1980 and number of the unemployed and underemployed has reached the alarming level of 20 per cent of the total workforce in Peru.

There has been drastic cut in the spending on public health programme despite the recurrence of cholera and diarrhoea among the slum dwellers. Consequently, the infant mortality rate in Peru, 60 per thousand live birth, is the highest (*The Progress of Nations Report*, UNICEF, 1993) in Latin America. The social cost of economic reforms has taken its toll in Argentina as well. Violence, drug trafficking, malnutrition of children, all these have increased in the slums of Buenos Aires and other cities with the rise in unemployment reaching 12 per cent of the total workforce.

Notwithstanding these negative aspects of their economic policies, it is the economic record that has stood both, Menem and Fujimori, in good stead. And when stability becomes a buzzword who cares if the 'saviour' has been flaunting democratic norms and ruling by decrees. It is to be noted that during his first term, Menem issued as many as 360 decrees (of necessity and urgency which empowers the president to by-pass the congress) to implement his programmes, whereas his predecessor had issued only 10 decrees in the preceding five-and-a-half years (*The Time*, May 15, 1995). In fact, ruling by decrees has been more a norm than exception in Argentina during Menem's regime.

Similarly, Fujimori, under the new constitution, acquired enormous executive powers and also resurrected the ministry of presidency with special allocation of millions of dollars to dole out to the needy persons or institutions including municipalities. He appoints all governors, judges in the Supreme Court and his approval is a must for all development projects. The parliament is meant only to put a rubber stamp on the legislations proposed by him.

In Brazil, one year has already passed since the latest economic reforms programme (also known as 'Real Plan') came into effect. Meanwhile its author, Fernando Henrique Cardoso, got elected and assumed presidency on January 1 this year. But his 'Real plan' is yet to gain the congressional approval. The plan has been implemented through presidential decrees. This provisional measure has legal validity for 30 days only but it can be re-promulgated before its expiry, and can be renewed endlessly. No wonder, president Cardoso has issued more than 150 decrees, even on subjects like creation of new government agencies.

In a desperate situation where people are struggling to survive, who will care for the social cost of economic reforms or for that matter the niceties of democratic governance. What matters immediately to them is economic stability since they do not want to return to the past. Incidentally, Menem had literally told his electorates that they had to make a choice - 'either me or chaos'.

Structural Adjustment on the Baltic

Nigel Harris

Hard hit by the disintegration of the Soviet Union, the economies of the three Baltic republics are recovering at a slow pace amidst social dislocation faced by their populace

WF are travelling south from St Petersburg, through the three Baltic states – Estonia, Latvia and Lithuania – to Poland. It is a flat land of cultivated prairies – a kind of Nordic Nebraska, with great forests that for a decade offered shelter to the nationalist guerrillas who fought the Soviet occupiers after second world war. The land is dotted with ancient Germanic cities – now ringed with the apartment and office blocks of the Soviet era. In eastern Latvia and in Lithuania, historically, Polish influence is strong (and the Lithuanians are Catholic, like the Poles, not Lutheran like their northern neighbours). The Germans fled after 1945 – an earlier ethnic cleansing – but the relics are still there, the Lutheran churches (even where the orthodox priests have claimed them – or the agricultural collective uses them as barns), the trim cottages, the tree-lined roads, they are as melancholy as the ex-Sikh villages of Pakistan or the Muslim equivalents in India.

In Kaliningrad, an island of Russian territory south of Lithuania and north of Poland (with no land access to Russia proper) the ghosts are now coming alive. For this is former Königsberg, the heart of old Prussia. It was largely flattened by British bombers in one of those orgies of destruction that was make briefly righteous. The Russians rebuilt it in that hideous style of grey blocks – like endless barracks and vast highways which constitute the essence of Soviet modernism. But on the island where the old centre existed they shored up the ruins of the cathedral of the old Prussian kings. It is now a favourite stopping off point for the masses of German tourists who return to – for elderly Prussians – a holy place. In the cathedral grounds is the grave of one of Königsberg's most famous sons, Emmanuel Kant – now become – for whatever bizarre reason – a shrine where newly weds place their marriage flowers. Has the categorical imperative acquired a nubile dimension?

If the future of the world belongs to small states, as some argue, then the three newly-independent Baltic countries herald the new world order. The populations of Estonia, Latvia and Lithuania are respectively 1.5 million (70 per cent urban), 2.5 million (69 per cent urban) and 3.7 million (68 per cent

urban). Before 1991, their identity was buried in the old Soviet Union. Now they have separate seats in the United Nations, separate currencies and flags, and the historians are busy carving out a slice of history, fact or fiction – to vindicate an eternal existence. Now the statistical smoke is clearing, the three Baltic states emerge as – by World Bank reckoning – middle income countries with per capita gross domestic product levels (and in brackets – annual rate of growth 1980-93) of: respectively, \$ 3,080 (-2.2 per cent), \$ 2,010 (-0.6 per cent), \$ 1,320 (-2.8 per cent).

All three have experienced a very severe slump – the most severe in their recorded history, as the result of the break up of the Soviet Union. When, after the second world war, Moscow forcibly incorporated the three (they had been independent in the interwar years) – the Soviet plan reshaped the economies to fit all-Soviet priorities.

Perhaps because the population was historically well educated – Estonia for example – claims a 78 per cent literacy rate as early as 1897 (and by the 1780s they say 40 to 50 per cent of the population could read) – the three were made the location for Soviet advanced industry, particularly supplying the military-industrial complex. The three were rapidly industrialised and came to export energy, petrochemicals, mechanical and electrical engineering products and consumer goods, half the power generated was supplied to the rest of the Union. The industrialisation was based upon extraordinarily low priced Soviet energy and raw material supplies, and paid no attention to the real costs of transport of alternative locations. In agriculture, the land was turned to specialise more in cattle, livestock and dairy produce – based upon very cheap imported grain fodder.

Industrialisation went well beyond the local supply of workers and skills, especially given the departure of the mainly urban Germans. Thus, Russians came to replace the Germans. In Estonia, 200,000 Russians arrived almost immediately (as, Estonians say, 50,000 Estonians were deported or liquidated). By 1979, 35 per cent of the inhabitants were non-Estonians. In Latvia, too, about a third of the population were

drawn from elsewhere. They were concentrated in industry and administration, and in the cities. The most extreme examples were Narva, on Estonia's northern border with Russia, where 78 per cent of the population is still Russian, or Latvia's seven largest cities where Latvians are a minority (and in the capital, Riga, two-thirds of the population are said to be Russian). Only Lithuania escaped much of what is now seen as deliberate colonisation – perhaps because there were more Lithuanians with industrial experience because of the proximity to the more industrialised Poland, those from the old Soviet Union (excluding the Baltic republics) constituted only 12.3 per cent of the population in 1990.

THE SLUMP

From the Baltic perspective, the incapacity of the old Soviet Union to continue to supply very cheap energy and raw materials made it impossible to sustain the economies. The planning system collapsed – dislocating all the connecting flows. The old CMEA group disintegrated, removing both suppliers and markets – and then the collapse of the Soviet Union hopelessly compounded the disaster. This imposed a major slump on the Baltic republics quite independently at that stage, of the modest efforts to reform. A system founded in a centralised allocation of inputs and outputs of rigidly guaranteed employment, wages and consumption broke up on the reefs of the world and domestic markets. The confusion – symbolised in the failed Moscow coup of 1991 – allowed the three tiny Baltic states to slip out of the Russian noose. If they had stayed the disaster would have also pulled them down but without any capacity to help themselves. They left exploiting the opportunity of Moscow's paralysis to reassert their demand for national liberation.

The cost of the breakdown has been very high. From an output which was wilfully material – energy – and transport-intensive, the three were obliged as swiftly as possible to restructure their economies to fit world scarcities. A large part of the old output, as in Russia, had become unsaleable at any sort of realistic prices – or they presupposed absurdly cheap energy or raw material supplies, or they just failed to fit a modern economy. Continuing difficulties in Russian input supplies forced the Baltic states to import from the European Union, and to direct their exports there in order to pay for imports. The ending of cheap cattle feed from Russia and eastern Europe forced a violent reorientation of agriculture back towards arable farming – there was a radical

contraction of meat output. The end of cheap energy and raw materials paralysed industry. In 1992, industrial output declined between 25 (Estonia) and 37 per cent (Lithuania); agricultural production went down by between 12 (Latvia) and 24 per cent (Lithuania); and gross domestic product, between 15 (Estonia) and 27 per cent (Lithuania).

The crisis was most severe in industry and in the state-sector (a small-scale private sector had been allowed in the old Soviet Union from 1987), and therefore in the cities and for the Russian industrial working class. In Latvia in 1994, for example, former Soviet citizens (excluding citizens of the Baltic republics) were 36 per cent of the population, but 47 per cent of the officially unemployed. The misery of many of the Russians in some parts of the countries is palpable. A significant number began the trek back to Russia (an emigration increased by the ultimate evacuation of the Russian armed forces).

CRISIS CONTINUES

The year 1992 did not end the crisis, and although Latvijas Banka, the central bank of Latvia, claims that the economy 'ceased contracting' in 1994 and began an upturn, the evidence is far from conclusive. As always in macro-economic reform, it seems, an increasingly large part of the economy slips out of the statistical network. But whatever the series, the last half decade appears disastrous.

Consider the random selection of figures from Latvia and Lithuania given in the accompanying Table. The decline in industrial output, by sector, is even more disastrous. The overwhelming bulk of this statistical decline has been in the state sector (where the statistical collection services are more developed). The old agricultural collectives of Latvia have seen output decline officially by 82.5 per cent from the peak of 1985 (to 1994). Simultaneously, private agricultural output expanded by 40 per cent, far too little to change the overall figures (capital investment and electricity consumption have both plummeted, and been redistributed to private peasant and commercial farming).

The most damaging indictment however is, as in Russia, the figures for the average expectation of life at birth for men. These have declined from their peak years as follows:

Estonia: from 67.0 years (1989) to 64.1 (for males and females together, 71 to 69.6;
Latvia: from 65.5 years (1985/86 to 61.6 (70.2 to 67.0);
Lithuania: from 66.6 years (1990) to 63.3 (71.0 to 69.1).

Again, as in Russia, the increase in deaths for males is not the result of either an increase in infant mortality or increases in deaths for the elderly, but is hunched in the active age groups.

The figures seem so catastrophic, it encourages scepticism. Furthermore, they are not consistent with other evidence. To the visitor, the standard of living for the majority is austere, but is not in such violent contrast with the old Soviet Union. There is a lot of money about – the shops are full and buyers plentiful (and the shops would not be full if there were no buyers). In the cities, there is something of a building boom, especially concentrated in renovating and rebuilding the older historic quarters. The figures on consumer durables show a steady improvement – in the first three years of the decade in Lithuania, car ownership increased from 128 per 1,000 population to 155, and telephone ownership, from 158 to 183. Of course, this could just mean greater inequality, except that there are few of the signs of growing poverty and deteriorating nutrition among the population at large. Above all, despite the male death rate, virtually all the statistics on health show a steady improvement.

The jury is still out. But it seems the benchmark figures of the past may be considerably exaggerated. The data available have been collected in a statistical system just being created, and there are problems of comparability between the old series and the new (and between the material and gross product systems). Above all, liberalisation allows and gives an incentive for a larger and larger part of the economic system to escape statistical monitoring. The state sector is tightly monitored. The new private sector is not and, of its nature, cannot be at tolerable cost. Furthermore, a major part of basic food

supply is now said to be created within households or sold informally without being recorded. There is, as everywhere, little reliable information on what is called the 'shadow economy' – one of Lithuania's leading statisticians put it as equal to between 15 and 30 per cent of the country's gross domestic product (the frequency with which that range is cited in many different countries suggests it is no more than a conventional rule-of-thumb, rather than based on hard evidence).

Reality may not be as disastrous as the figures suggest, indeed, the figures are so bad that, if true, the situation would constitute the breakdown of society. But the picture is still not good. Restructuring has been painful and there have been major losses. Consumer budget surveys often escape the problems of national statistics, and they show a significant deterioration in the standard of living – a sharp increase in the proportions of income spent on 'basic necessities', especially food, and a shift in food consumption away from high to low valued goods – from meat to vegetables and fruit (which some optimists see as the explanation for the improvement in health status).

The unemployment figures are even less reliable than the output data, especially where inflation has devalued unemployment benefits (the basis for registration and so the foundation of the statistics), and registration entails undertaking compulsory manual work for the government. One local Latvian study suggests that some 17 per cent of the workforce were out-of-work and searching for it (compared to official national rates in the 5 to 8 per cent range). Where an old state-owned enterprise operates in a new town (without alternative employment sources) and is restructuring, there may be localised high figures for unemployment of this order

TABLE SOME INDICATORS ON THE ECONOMY OF LATVIA AND LITHUANIA

	Latvia (1990-94)	Lithuania (1990-93)
Total floor space of completed residential building, '000 sq m (per cent)	-76.7	-34.8
Value of agricultural output (constant prices)	-17.2	
Value of gross industrial output (constant prices)	-6.4	75.0
Average purchasing power of the population (constant prices)	-54.0	
Per capita per annum average food availability, kgs.		
a) meat and meat products	-29.0	-41.0
b) milk and milk products		
c) eggs and egg products	-79.5	53.0
d) fish and fish products	-57.8	-54.9
e) sugar	-25.2	-41.9
f) potatoes	-4.0	-16.5
g) fruit and berries	+62.5	+51.5
h) vegetables	+5.8	-12.7
i) cereal and cereal products	+4.7	+13.0

of magnitude but otherwise the problem is less the shortage of work than low incomes. Officially the majority of the unemployed are women (in contrast to Western Europe), and the out of work are bunched at the extremities of the age range: the young and the elderly.

Government pressure and the high cost of severance pay have discouraged state firms from sacking. Instead workers are put on short time or long periods of unpaid leave without this counting as unemployment. Real wages have certainly declined and food prices and housing costs have led price inflation in all three republics. But no one knows what proportion of income is now generated outside what is counted officially as work. Those tell tale signs of poverty – the undernourishment of infants, the families sleeping rough, the horde of children hustling and begging – are not obvious.

The more severe damage seems to have been inflicted on people's sense of security. Real incomes – and even more – consuming power – were low in the old Soviet Union, but at least a minimum level was guaranteed. Now labour mobility both hirings and firings, has sharply increased. The value of social security payments has declined precipitately.

'We have forgotten our old people' someone tells us with a tear in her eye. Outside the churches a few aged and disabled – usually women in headscarves and archaic dress – humbly wait for a coin (unlike Western Europe and North America where it is the young who beg with confidence – even impudence). An increase in poverty has gone with the manifest signs of increasing inequality. That is social stratification – a Latvian declares with repressed fury as a large shiny car slides noiselessly past. The old idea of equality in austerity has for many a continuing moral validity.

The populations of the Baltic republics are ageing. The Russians who leave tend to be in the active age groups – so the resulting contraction in the labour force is exaggerated. It is the city labour force where this is shown most sharply. The workforce of Tallinn – capital of Estonia – has shrunk by 8.4 per cent since 1990 and Riga's population has declined by 7.3 per cent since 1989. In the future the burden of social security for the aged will grow as the labour force is shrinking. All three governments are trying to raise the retirement age (from around 59 to 65) to compensate – but the previous types of economic activity have often left older workers in poor health if not disabled and working conditions remain poor.

THE NEW

Yet despite all the difficulties the three economies have gone a long way in economic

restructuring in an extraordinarily short time, to find a new economic *raison d'être*. Foreign trade is the most dramatic index of this. In 1990, 95 per cent of the three republics' exports went to the Soviet Union, which supplied between 80 and 87 per cent of imports. By 1994 about 30 per cent of Estonia's exports went to the CIS group which replaced the Soviet Union 43 per cent of Latvia's and 47 per cent of Lithuania's. The respective figures for imports from the CIS were 20, 30 and 50 per cent. Indeed given the currency difficulties – severe problems in border transactions and high Russian duties on imports from the Baltic countries – it is remarkable that even these levels of trade persist. On the other hand exports have shifted away from heavy industry – other manufacturing and meat and dairy products – to other foodstuffs – raw materials (particularly timber and timber products) and light industrial goods.

It might be thought that the three republics would try to keep free trade relationships between themselves when they became independent – but they rapidly developed familiar squabbles – and new significant border barricades. A Baltic Free Trade agreement was signed in April 1994 but it has not produced dramatic results so far. Agriculture has been excluded for a transitional period, because – say the Estonians – the Latvians subsidise farming – and say the Latvians – the Lithuanians subsidise farming. In an ancient nonsense put forward by a Latvian economist.

Agriculture is a fundamental part of the cultural identity of Latvia – as if cultures never changed – and as if these grounds were adequate to deny the mass of poor Latvians cheaper food from Lithuania.

Furthermore the new private sector has grown swiftly since it was permitted in the old Soviet Union in 1987. It has increased four-fold since 1990 – with official registrations reaching in January 1995 57,000 (or 30 per 1,000 population) in Estonia and 120,000 (34 per 1,000) in Lithuania – and 29 per 1,000 in Latvia (compared say to the European Union's 43). The bulk is very small (under 10 employees) but the private sector as a whole now employs half the labour force in Estonia and 64 per cent in Lithuania.

Privatisation of the old state sector has been much slower. Governments have been reluctant to relinquish the powers of patronage. Estonia has reserved key sectors for public ownership (mining, power, railways, engineering, highways, posts, seaports) although even here the form is to be the joint stock company rather than ministerial dependencies. Latvia has declared it will retain 30 per cent of the national economy – covering natural monopolies and various other sectors (pharmaceuticals, tobacco, alcoholic beverages, military equipment, some banks). Lithuania has postponed the sale of public monopolies until the next century – laying down that it will retain direction of sectors producing goods of importance for the state or the population. Now that the three have launched themselves on world markets they may find these formulae become increasingly restrictive in terms of economic performance and high cost. In terms of privatisation – let alone real restructuring – the progress has been slow. Lithuania claims to be in the lead with 78 per cent of the former capital of the state now sold off (including all agricultural enterprises).

NEW BOOK FROM

MD

PUBLISHERS OF THE
HUMANITIES, NATURAL
& SOCIAL SCIENCE

RACES OF RICE IN INDIA

Edited by

The Reporter on Economic Products to the Government of India

Rep 1996 (of 1910), 594p, append, errata, 22x14cm

ISBN 81-85880-91-3

Rs 600.00

This book is a valuable alphabetical index and a guide to the literature on races of rice in India. The sources of information were scanned from 1896-1910 to include about 9000 races of rice in India which then included present Pakistan, Bangladesh, Bhutan and Burma.

The issue of Russians – those in the old Soviet Union with internal passports saying they were Russians – in the Baltic states is the unresolved question. Russia is one of the largest loose cannon in world affairs, and the Baltic states could connect with the switchback of politics in Moscow, especially alarmingly after the Chechnya experience. Many of the Russians in the Baltic were as committed to the independence of the republics as those who claimed to be indigenous; many have learned the local language and seek to be good citizens of the new states. But it is understandable if especially Estonians and Latvians nurture tears for their political independence, particularly because economic restructuring has hit harder the Russian industrial workforce in the cities (where they often predominate). Moscow has made clear its eagerness to dabble in the politics of its new neighbours, former republics of the Soviet Union, and 'the defence of the interests of Russians' living abroad is everywhere the pretext for intervention.

Language is – as it always was within the Soviet Union – a key political issue. In Latvia, 36 per cent of school enrolments are still in Russian-medium schools. The lack of teachers and textbooks is blamed for this, but why should Russians be denied the right to education in their mother tongue which thereby gives them access to the much vaster educational and work opportunities of Russia? It is a hallowed principle of the treatment of minorities. If Estonians want to learn a second language, they choose English or French or German; why should Russians be denied this opportunity and obliged to learn Estonian as their second language? The Riga police, a Latvian mutters darkly, are still Russian, and the city possesses a significant colony, he says, or retired Russian army officers, many of them still relatively young.

In Narva, on Estonia's northern border with Russia, 86 per cent of the inhabitants are Russian and the rate of unemployment is said to be among the highest. There is an air of decay, of demoralisation and menace; the crime rate is said to be high. On the bridge across the river which is the border (with two medieval castles glaring at each other on each side), there is a sad line of Estonian cars waiting to enter Russia. If the Russian immigration officers feel tired, it can take a day although the traffic is small. As everywhere, immigration officers are empowered with the discretion to sacrifice economic activity – and the time of those stupid enough to want to cross borders – to the paranoid fantasies of their governments. At the then rate of crossing, I calculate they handle about 8,000 vehicles a year, and I

ask the immigration officer how he might cope with the 80 million border crossings between southern California and Tijuana. He chortles with delight and translates my question for the amusement of his colleagues, returning with, 'Ah, but this is Russia'. He does not know Lenin's phrase for Tsarist Russia, 'a prison of peoples', where all foreigners are regarded as spies (or, now, a source of bribes).

The rationale for all this tiresome regulation is that the border areas are ideal for criminal activity (except that the criminals are not so stupid as to be caught by the lumbering bureaucracy of the border guards; it hits only the innocent). The Russian mafia, it is said, flee to safe havens in the Baltic republics, and provide the backbone for the protection rackets there, the drug and arms running. Cash laundering must also be significant since, unlike the Russians, the currencies are freely negotiable. The extraordinary movement of Russian oil money is said to have been a factor in the collapse of Latvia's largest commercial bank, the Baltija, in the spring.

One symptom of the tensions has been the debate over who should be entitled to citizenship in the new Republics – all who live there (as has happened in Lithuania with its relatively small Russian population) or all who were there (including their descendants) in 1939, the last year of the old independent republics. In the case of the second option, all others would then be required to wait in the queue, to demonstrate their competence in the local language and fulfil other residence requirements over a period of years. For those born and brought up in the Baltic republics but now suddenly transformed into foreigners, this is an indignity only likely to infuriate.

Apart from those many Russians born in the Baltic republics, there are others who quite by chance find themselves, through the vagaries of the break-up of empire, suddenly in a foreign country (as happened to the Germans before them, some claiming ancestry in the Baltic since the 12th century, and more tragically, with the Baltic Jews). In a Riga cafe, we fall into conversation with an Armenian woman (or so she claims when the mood takes her since her father had Armenian nationality in the old Soviet Union), who was born in now independent Moldavia. She moved to Latvia with her husband, a Russian army corporal, but she says laconically, he has now fled to Russia to escape his debts to the local mafia. She was lucky – when the music stopped, she found herself in one of the most charming cities of the old Soviet Union. But of the four independent countries she has some claim on, which is she to choose?

The dangers are much greater because of the long gruelling crisis of poor Russia. In

beautiful St Petersburg, there seems a sense of exhaustion. The historic Russian project collapsed – to lead the world to a new civilisation out of the squalor of old muzhik Russia, to define progress itself. It was a spectacular fantasy which held a large part of the globe in thrall for much of this century. Now not even the monuments remain, and Tsar Peter's glorious Germanic city has swamped Lenin's. Anyone old enough to have been serious about the former Soviet order must now wither before the scorn and derision of the young and of the republics like those in the Baltic which for decades were bludgeoned into conformity with the myth of proletarian power. Yet, on the other hand, despite all the problems, the transition has been made, so perhaps even many of the older generation no longer believed in the Soviet myth. Wearily, the new world of gangsters and hustlers, of flashy cars and fur coats, may not seem much worse than the old one of grey bureaucrats, a corrupt but militarised society, and hideous gulags.

The scourging of Russia, the stripping of its dignity, could make the Baltic republics part of the anvil on which to forge a new Russian unity or yoke. The Estonians and Latvians cannot concede nationality to their Russian inhabitants without seeming to betray the struggle for national liberation. But if they do not, they create a potential fifth column, and some Russians would no doubt welcome the opportunity to make their fortune by helping Moscow's return and the resumption of the role of Russians as master race. As all third world countries discovered, national independence does not mean the end of history.

As always – it is the pitey of our materialist age – economic growth may ease some of the problems within the Baltic states. But that is only possible for them if an open world economy is preserved. If the world economy again becomes reduced to the relationships between states – where political muscle is crucial to national economies – then the three are lost for they are far too small. But, as Singapore and Hong Kong demonstrate, if the world economy is primarily world markets, operating independently of governments, then there is some hope that small size can be a source of strength, of nimbleness and flexibility in identifying and exploiting niches in a world system. Then the great lumbering mammoths of the large powers have the most to fear from a global system since it undermines their central power. The Baltic republics opted for political separation from the Soviet Union in order to pursue economic integration with the world. They have gone quite a long way on that road, and despite all the problems, there are now some grounds for modest optimism.

Critique of Political Economy

Neglected Aspects

Behzad Yaghmaian

The Marxian Concept of Capital and the Soviet Experience: Essay in Critique of Political Economy by Paresh Chattopadhyay; Prager, London, 1994.

PARESH CHATTOPADHYAY's book is an important, timely, and refreshing contribution to the Marxist literature on socialism and the critique of political economy, and a novel approach to the long-debated question of the nature of old Soviet society. Through extensive research in primary sources in German and Russian, Chattopadhyay presents a thorough analysis of some neglected aspects of Marx's critique of political economy, as well as a brilliant application of this analysis to the case of the Soviet Union. Chattopadhyay's book is technical, but accessible and extremely clear in its presentation. It is a research project with long-lasting value to the students of Marx in both the academia and the movements for social change. This is a profound and solid case in support of Marx's libertarian perspective and the viability of his vision of socialism.

In this book, Chattopadhyay argues that the old Soviet Union was neither socialist, nor non-capitalist, as argued by Sweezy and others. The Soviet Union was a capitalist society with all essential characteristics of capitalism. The social relations of production in the Soviet Union was marked by the separation of the immediate producers from their conditions of production. The immediate producers were 'free labourers' in the double sense articulated by Marx. While being the non-owners of the means of production, the labourers were free with respect to individual units of production. Consequently, the immediate producers assumed the character of wage labour, confronting their conditions of labour as alien objectified labour – as capital.

Chattopadhyay characterises the regime of accumulation in the Soviet Union as what he calls the accumulation of capital of the second type. This is accumulation based on the exploitation of wage labourers and without continuously revolutionising the methods of production. Guided by the objective of rapid industrialisation, the Soviet regime of accumulation, argues Chattopadhyay, followed the path of quantitative expansion of production under stationary methods of production. This particular regime of accumulation, finally reached its limit, leading to the crisis of the over-accumulation of capital (or equivalently the under-production of commodities) and the eventual collapse of the Soviet system.

These arguments are articulated and substantiated in three parts. In the first part (Chapters 1 and 2), Chattopadhyay develops a theoretical framework within which he analyses the Soviet experience in the remainder of the book. In Chapter 1, he presents an analysis of the concept of capital in Marx, while discussing two types of capital accumulation in Chapter 2. The second part of the book (Chapters 3, 4 and 5) is devoted to an application of the Marxian categories developed earlier to the study of the Soviet Union and the causes of its collapse. In the last part (Chapters 6, 7 and 8) Chattopadhyay critiques other Marxist attempts to explain the Soviet Union as either a socialist or a non-capitalist.

The starting point in Chattopadhyay's inquiry is the theoretical discussion of the concept of capital in the sense of Marx. This is the most significant contribution of the book. It is through this analysis that Chattopadhyay develops a theoretical structure that enables him to demonstrate very convincingly that the relations of production in the old Soviet Union were capitalist in nature. He begins the analysis by exploring the "double existence of capital": its 'economic property' – referring to the relations of production, and its 'juridical property' – referring to the ownership relations of capital. The distinction between the two properties of capital becomes the foundation and the cornerstone of the theoretical model within which he then analyses the Soviet economy and demonstrates its correspondence with the category of capital in the sense of Marx.

Capital in its economic existence is a social relation of production – a social totality in its essential reality, representing the capitalist class in opposition to the wage labouring class. But in its phenomenal reality, this social totality – the social total capital (STC) "appears only in fragments, as reciprocally independent, singular capitals" (p 12). It is this totality-singularity nexus that underlines the 'double freedom' of wage-labourers under capitalism. On one hand, the labourers confront the means of production as their non-property – as capital – the property of the capitalist class. In this sense, capital is the class property – private property of the capitalist class, and the non-property of the working class. This is the first sense of the labourers' freedom, achieved through a historical process of

expropriation and separation of the immediate producers from their conditions of production.

On the other hand, the wage-labour character of the working class, also necessitates their 'freedom' in a second sense. Here, the labourers must be free with respect to reciprocally independent units of capital (firms). This ensures the commodity character of labour power and the existence of a labour market where labour power is freely exchanged in contracts between labourers and individual units of production. The second sense of labourers' freedom, by definition, implies the competition of capitals – the fragmentation of total social capital into reciprocally autonomous capitals.

An essential component of the theoretical model elaborated by Chattopadhyay is his treatment of the separation of capital's economic property from its juridical property. Quoting various statements by Marx, he argues that the juridical relations arise from production relations. In its juridical existence, capital assumes a multitude of forms ranging from the 'private' property of individuals/families to the common capital of 'associated capitalists' or 'public' (state) property. But in all of these particular juridically recognised forms of property, capital remains a class property – the private property of the capitalist class. The individual private property – the private property based on one's own labour – the earlier historical form of private property – is itself negated within the confines of the capitalist class (private) property. As Chattopadhyay argues, "capitalist private property in Marx's first sense – that is, as class property – is of course invariant with respect to changes within the capitalist mode of production. However, private property in capital in the sense of individual property (Marx's second sense) changes its form (assuming different juridical forms) in corresponding to the needs of capital accumulation" (p 24). Centralisation of capital, and the emergence of loan capital and share capital are among the major ruptures, leading to changes in capital's juridical property, without altering its economic property.

Centralisation of capital leads to a split in capital's property-function unity. Thus, capital which is social in essential reality becomes social also in its phenomenal reality, leading to what Marx called 'directly social capital' (DSC). Share capital is the first form of DSC, while state capital represents its second form. State could own a segment of the national capital, or alternatively take over total social capital (TSC) altogether. In the latter case, social total capital becomes under the single juridical 'public' ownership of the state. But, the ownership of total social capital by the state, constituting a particular form of juridical ownership, does not negate the fundamental character of

capital as class (private) property. One can conclude from Chattopadhyay's arguments that the state becomes the capitalist class in this case.

Chattopadhyay completes this theoretical analysis by presenting what he calls two types of capital accumulation in Marx: the first type based on continuously revolutionising the methods of production while the second type based on unchanging methods of production. Each of these types of accumulation produces a specific type of over-accumulation. The former type leads to over-accumulation of capital in the form of over-production of commodities. The latter type, on the other hand, leads to over-accumulation of capital that corresponds to under-production of commodities – that is, an economy of shortage. Chattopadhyay focuses on the second type of accumulation and argues that it is this latter type that explains the specificity of the mode of capital accumulation in the Soviet Union.

Given the unaltered and stationary methods of production, argues Chattopadhyay, the mass of surplus value can be increased by prolonging the working day, employing more labourers, or increasing the intensity of labour – a variant of increasing the absolute surplus value. In this case, production increases without a corresponding increase in the productivity of labour, as such. Thus, masses of commodities produced increase merely because more capital is used. In this situation, the increase of population constitutes the mathematical limit of the production of surplus value by total social capital (Marx, quoted on p. 34).

The extensive growth of production based on unaltered methods of production can eventually lead to an increase in wages when the needs of capital accumulation surpasses the increase in the supply of labour. The growth of capital renders the exploitable labour insufficient (Marx, quoted on p. 40) and accumulation based on the quantitative extension of capital reaches its limit. Quoting Marx, Chattopadhyay states that capital is over-accumulated here, from the moment when capital increases in relation to the labouring population in such proportion that neither the absolute labour time furnished by this population could be prolonged nor surplus labour time extended. This is the case of 'absolute over-accumulation' or 'absolute over-production of capital' (Marx, *ibid*). Thus, Chattopadhyay concludes, 'absolute over-accumulation of capital being outcome of the process of accumulation based on (largely) *stationary* method(s) of production, would logically be associated with *underproduction* (as opposed to over-production) of commodities or in other words with 'the economy of shortage' (p. 40).

The significance of Chattopadhyay's articulation and focus on this neglected part of Marx's critique of political economy becomes evident in his analysis of the Soviet experience in the second part of the book. It is here that Chattopadhyay applies the

second type of capital accumulation in Marx and develops a novel and convincing explanation of the nature and the causes of collapse of the Soviet Union. Through a careful analysis of Soviet government statistics and texts including the writings of Bolshevik leaders like Lenin, Chattopadhyay demonstrates the capitalist nature of the Soviet economy and the existence of the economy of shortage – over-accumulation of capital of the second type.

Using the theoretical framework developed in the first two chapters, he argues that juridical ownership of the means of production by the state ensured the separation of labourers from the objective conditions of production and their own existence as wage labourers. The state-owned property was the non-property of the labourers. Thus, Chattopadhyay argues that 'public property in the Soviet Union was, no more than private property in the primary sense of Marx. Using various statistics and indicators, Chattopadhyay demonstrates the totality, singularity, configuration of the Soviet capital and the existence of reciprocally autonomous relations between different units of production: that is, the existence of competition of capitals in the Soviet Union.

Chattopadhyay demonstrates the existence of a labour market and the exchange of commodities in the Soviet Union. Legislated by the law, the Soviet workers were free to choose their trade and place of employment, cancel a labour contract, or leave a particular enterprise for another. Thus, Chattopadhyay argues that although the Soviet workers were accessories with respect to total social capital – state capital in this case – they were free in relation to the individual units of production. This ensured their double freedom and their existence as wage labourers.

Building upon the findings about the capitalist nature of the economy, Chattopadhyay then puts forth an analysis of the mode of accumulation, arguing that 'the accumulation of capital in the USSR through time has been an amalgam of the elements of the original accumulation of capital, formal subsumption of labour under capital and certain phases of the real subsumption of labour as envisaged by Marx – that is, predominantly based on the extension of productive resources employed and not on the continuous revolutionisation of the methods of production' (p. 61). This thesis is substantiated in the book by careful and extensive scrutiny of statistics and indicators on technical change, labour productivity, rate of retirement of capital, etc.

The accumulation of capital was originally achieved through the expropriation of the peasantry by the collectivisation of agriculture and other legislative measures, argues Chattopadhyay. The agricultural sector, in addition to supplying food and raw materials for the manufacturing sector, was, at the same time, the main source of the labour supply. Given the unchanging

methods of production, the increase in surplus value (and the overall productivity of the economy) was rendered possible by the prolongation of the total labour time through the introduction of seven-hour day coupled with three-shift work. This was further reinforced by various measures to increase the intensity of labour, including enforcement of discipline and introducing various methods such as socialist competition, shock brigade campaign, the use of piece work as the preferred method of wage payment, and other similar measures.

Given the extensive use of labour, even during the pre-war years of high population growth, the labour force was growing at a faster rate than the population in the Soviet Union. Also, as the data presented by Chattopadhyay indicates, the growth rate of the means of production in use has been much faster than that of the employment of living labour. However, this trend was not matched by a corresponding increase in the productivity of labour. Given this situation, the ability of capital to grow and accumulate was bound to reach its limit. In fact, as Chattopadhyay demonstrates statistically, the productivity of labour has been consistently falling in the last four decades, except for the period 1966-70, and the productivity of capital has been negative except for 1950-51.

Thus, in the face of this double decline, concludes Chattopadhyay, combined with the near impossibility of steadily increasing the mass of labour power used, or given the basically stationary methods of production raising the rate of relative surplus value, we seem to be in the presence of a situation which largely, if not in detail, corresponds to that of over-accumulation of capital associated with capital accumulation of the second type as analysed by Marx (p. 77).

Having presented his formulation of the economy of shortage in the Soviet Union, Chattopadhyay spends the remainder of the book on the non-capitalist thesis and other characterisations of the Soviet Union. Here too, Chattopadhyay uses the theoretical categories developed earlier and illuminates the departure of the socialist and the non-capitalist theses from Marx's method and theoretical framework. Chattopadhyay's discussion of the socialist revolution, the transitional society, the role of state in the transitional period, and the nature of the socialist/communist society is grounded in Marx's libertarian vision and his philosophy of liberation. As he argues, it is this vision and philosophy that was missing from the start in the USSR. Faithful to Marx's belief that 'the emancipation of the working class must be conquered by the working classes themselves', Chattopadhyay rejects the contention that the October Revolution constituted a socialist revolution and articulates a vision of socialism that is based on self-emancipation of producers, leading to "a society of free and associated producers", or alternatively, a union of free individuals.

Balkans in Transition

Will Padmore

Broken Bonds: Yugoslavia's Disintegration and Balkan Politics in Transition

by Leonard J Cohen, Westview Press, Boulder and Oxford (2nd ed), 1995, £ 11.95

THIS is an excellent book by a teacher of political science at Simon Fraser University British Columbia Canada. *The International History Review* said of the first edition that it was "far superior in its factual coverage and balance to its various competitors in the field." He has told the story as completely and as impartially as we are liable to get. Cohen gives a brief history of Yugoslavia in the first chapter. The rest of the book gives a detailed account of Yugoslavia's breakup and the war.

Yugoslavia existed as a state from 1918 to 1991. Under Tito it had a devolved and federal constitution. This gave parity representation to each of the six republics in the Yugoslav federation even though Serbia was by far the biggest. Tito selected people for jobs by ethnic arithmetic and rotated top officials annually. But these policies signally failed to unify Yugoslavia. The constitution encouraged those who wanted to split the country. They had a two-track strategy. They aimed to move from federation to confederation as a step towards independence. At the same time they formed separate institutions designed for complete independence.

Outside forces seized on these internal failings. In January 1991 the US and German ambassadors pressed the Yugoslav National Army not to intervene to keep Croatia in Yugoslavia (p 190). In early 1991 Germany and other countries sold arms to Croatia and Slovenia (p 207). On June 25, 1991 Croatia and Slovenia unilaterally declared their independence. The Croats were desperate for foreign intervention. "The Tudjman government believed that immediate internationalisation of the Yugoslav crisis was absolutely crucial" (p 236). When the Yugoslav government deployed the National Army to hold the country together, the EC secretly threatened to cut off all aid to Yugoslavia. On October 4, 1991 the opening day of the EC Conference its chairman Lord Carrington presented an agenda "premised on the assumption that Yugoslavia no longer existed" (p 237). The EC announced that all the Yugoslav republics are sovereign and independent with international identity. As Cohen writes, "the EC had apparently made a political decision to dismember the Yugoslav federation" (p 237). Hurd warned in December 1991 that recognising Croatia and Slovenia would escalate the war. Carrington warned that recognition would weaken diplomatic efforts to achieve a

ceasefire and a settlement, and would also spread the war to Bosnia (p 239). Despite, or because of, all these good reasons, the EC including Britain recognised Croatia and Slovenia in January. The UN did too, despite its internal divisions about the propriety of intervention in a sovereign state's domestic disputes' (p 239).

The war did spread to Bosnia. In July 1991 the Moslem Bosnian Organisation tried to negotiate a Moslem-Serb accord to prevent war in Bosnia and to preserve Bosnia's territorial integrity. Karadzic accepted this for the Bosnian Serbs, but Izetbegovic, the leader of the Bosnian Muslims, rejected it (p 241). Izetbegovic is a member of the fundamentalist Fida'iyyane Islam, which wants to turn Bosnia into an Islamic Republic, although Muslims are only a third of the population. Bosnia's prime minister Haris Silajdzic tried to justify the composition of his government by saying 'It is a fact that Moslems make up 99 per cent of the Bosnian defence forces so it is natural that they form the government' (cited p 281). In so doing he gave the lie to the nonsense that Bosnia is some form of multicultural democracy. These armed forces have been "strengthened with thousands of volunteers from various Islamic countries" (p 294) and by illegal arms shipments often through Slovenia especially from Iran, Saudi Arabia and Turkey (p 318).

In his 1970 Islamic Declaration, which he reprinted in 1990, Izetbegovic wrote "The Islamic movement must and can take power not only to destroy the non-Islamic power but to build up a new Islamic one." Cohen notes the more militant and religiously nationalistic majority in the party led by Alija Izetbegovic (who had spent eight years in jail under the communists for his Islamic fundamentalist beliefs) (p 144). Cohen analyses "the role of traditional religions in generating ethnic conflicts" in Yugoslavia (p 331).

Again in February 1992 Izetbegovic sabotaged the Lisbon Agreement for Moslem-Serb-Croat power-sharing. He "later conceded that Bosnia might have avoided a violent war if it had stayed together with Serbia and Montenegro in a reconfigured Yugoslavia" (p 243). In early 1992 his dash for Bosnian independence was "prompted by the opportunity for quick recognition by the EC" (p 244). Even the US ambassador to Yugoslavia called his decision 'disastrous' (p 244). Cohen pointed out that "the lack of a political settlement among the major

ethnic groups within Bosnia-Herzegovina actually justified postponing recognition of that republic as another new state in April 1992" (p 245). But the EC and the UN went ahead with recognition. In the autumn of 1993 Bosnian Moslem government forces killed "thousands of civilian Croats in central Bosnia" (p 279).

The US has throughout the war campaigned for US intervention. As Cohen points out, it used hyperbolic calls of genocide (p 293) to try to justify intervention. It has vilified the Serbs and whitewashed the Bosnian Moslems and the Croats. To defeat the Serbs, the United States though not ostensibly taking sides in the war, had effectively engineered the Moslem-Croat agreement" (p 307). Cohen shows how "behind the scenes, Washington was gradually expanding its military support for the Moslems and Croats" (p 319). Clinton approved the initiative of a group of former US military officers to assist Croatia's armed forces (p 320). Cohen concludes:

As 1994 drew to a close an even more ominous threat to the Bosnian peace process was the possibility that the Clinton administration might be pushed by forces in the US Congress (particularly but not exclusively in the new Republican majority) to adopt some type of ill-conceived military intervention strategy which might potentially trigger a much wider and destructive Balkan struggle.

For the United States to actively intervene on one side in the Bosnian civil war would undoubtedly lead to a protracted military conflict in the Balkans that would be disastrous for US interests and seriously undermine any chance of achieving a lasting peace in the region. Indeed even a continuation of Washington's unfortunate encouragement of one side in the war through limited assistance and rhetorical support would surely diminish any hope for a durable peace (pp 319-20).

This threat is about to materialise. NATO wants to send 60,000 troops, costing £ 3.8 billion a year. Britain's 15,000 troops will cost us £ 635 million. The US's 20,000 will cost £ 1.5 billion a year. Germany is also to send troops. Cohen finishes by writing hopefully, "The imperatives of economic survival and reconstruction, as well as geographic proximity and other earlier interdependencies, suggested that such co-operation would eventually resume despite the recent episodes of terrible, ethnic, religious, and political violence" (p 364). But there is no chance of this vital peaceful reconstruction happening with 60,000 foreign troops in the country. Their presence will prolong the war in Yugoslavia, and increase the risk of spreading it to other countries. It will certainly worsen the tension between the NATO powers and Russia, Bulgaria and Greece will not appreciate the presence of so many NATO troops so near to them.

On Liberalising Agricultural Trade

A Note of Caution from India's Experience with Tea Trade

T Krishna Kumar
Ashok Mittal

A basic apprehension regarding the policy of promoting exports of agricultural products is its impact on food security in particular on domestic food prices. This concern becomes important in the light of the evidence of the weak supply response of agricultural production.

This paper examines the factors that determine exports of tea and observes that tea exports are insensitive to price incentives and to changes in world demand and decrease with increasing share of domestic consumption. It is also observed that the possibility of trade in tea links the domestic price of tea to the international price suggesting that if trade in agricultural products is extended to essential commodities their domestic prices are likely to rise.

The experience of tea suggests that a policy of export of agricultural commodities particularly essential commodities cannot be recommended without caution.

I Introduction

THE structural reforms being adopted by India consist mainly of (i) fiscal reforms (ii) financial sector reforms including weakening the Foreign Exchange and Regulation Act (FERA) permitting direct foreign investment, (iii) internal liberalisation (or privatisation and reduction of the role of the state) and (iv) trade liberalisation including trade in agricultural commodities and trade in services. The analytic framework to justify the economic reforms is the subject of a major debate between the proponents and the opponents of the structural reforms. Trade in agriculture is one of the major elements of this controversy between the supporters and critiques of economic reforms. The basic apprehension of the critiques is regarding food security and the impact of agricultural trade on the price the poor have to pay for essential food items. It is often argued that there is inadequate exportable surplus in agriculture in the short run, and that the agricultural supply response is not driven primarily by monetary considerations due to non-commercial nature of most of India's agriculture and because of certain institutional factors that are specific to India.

The debate between the protagonists and antagonists should, one would expect, be based both on theoretical and empirical arguments. This debate however is quite often not supported by adequate theoretical analysis. On the empirical side also aggregate econometric relations of a structural type are quite commonly used in the debate and they suffer from four main drawbacks. First the structural models are based on an economic structure that is assumed to be invariant during the entire sample period, and the time series nature of the data is ignored. Second,

if the economic time series are non-stationary it is now quite well known that the traditional structural equations portray spurious correlations and erroneous conclusions. Third the statistical evidence drawn from the time series data of the past are generated from the old economic regime. It offers insufficient evidence on what is likely to happen under a change in the economic regime brought about by structural reforms. Fourth aggregate relations do not capture the institutional specifics that are associated with the constituent parts, thereby possibly giving us a blurred picture. From the last point one would conclude that there is a need to specify the import and export functions in a disaggregated form with a few major commodity groups — such as major agricultural commodities, consumer goods, capital goods and services. Such a disaggregated approach will provide a greater

insight into the factors that determine the imports and exports of goods and services.

When our own thinking was along these lines we had come across a paper by Hanumantha Rao and Gulati (1994) that advocated a policy shift towards exporting of agricultural commodities in which we have a comparative advantage. We then decided to examine India's experience with respect to an agricultural commodity for which we already have exports and for which India has a comparative advantage. We thus examined India's experience with respect to tea exports. It may be noted that we are examining export experience with respect to a commercial crop grown as a plantation crop while the usual debate is about trade in (essential) agricultural commodities such as foodgrains. We argue therefore quite cautiously that the empirical evidence presented in this paper only

TABLE I INDIAN TEA INDUSTRY PROFILE (1950-1993)

Year	Area (in Hect)	Prodn (Metric Tons)	Yield (Kgs/ Hect)	Export (Metric Tons)	Value of Exports (Rs)	Unit Export Price (Rs/kg)	Share in World Export (Per Cent)	Share in Domestic Consumption in Prodn (Per Cent)

Annual compound growth rate								
(per cent)	1.02	10.59	10.41		11.48			

suggests (and does not prove) that one must give sufficient importance to institutional constraints, poor supply response and the possibility of agricultural commodity prices increasing in the short run. Such an increase in agricultural commodity prices at a period when the governments of the developing countries are forced to reduce the fiscal deficit, and subsidies in particular, can only lead to consumption deprivation and poverty.

The plan of the paper is as follows. Section II raises a few methodological issues. Section III provides a brief profile of India's tea production and trade. Section IV presents econometric evidence regarding some of the issues raised in Section II. Finally, the paper concludes with some cautious remarks in Section V on agricultural policy in a changing economic environment.

II

Methodological Issues

In this paper we are concerned mainly with trade reforms, and in particular reforms facilitating trade in agricultural commodities. Trade liberalisation can be justified under two alternative analytic frameworks. First, trade barriers can be treated as market imperfections in an otherwise perfectly competitive market environment. Then by appealing to the traditional neoclassical economic theory one can argue that removal of trade barriers would improve economic welfare.¹ Second, one may allude to the classical theories of specialisation, comparative advantage, Heckscher-Ohlin and Samuelson theorem of factor price equalisation to justify the virtues of free trade.

The logic behind some of the trade related reforms seems to be based on a partial equilibrium, comparative statics and *ceteris paribus* assumptions. The policy prescriptions become shaky if one relaxes the *ceteris paribus* assumption and uses a general equilibrium framework. This can be illustrated for example with the policy prescription of devaluation of a third world currency in order to increase its exports and decrease its imports and thereby reducing its current account deficit. A fallacy of composition is likely to operate in this case. If a third world country exports primarily primary commodities and if its competitors are some other developing countries that also export primary commodities then if all these competing third world countries devalue their currencies they increase the cost of their imports without in any way improving their export performance.

The task of examining the impact of reforms from analytic and empirical viewpoints is a very complex one. What we

propose to do in this paper is only to highlight some of the issues raised above by examining critically the suggestions made by Hanumantha Rao and Gulati (1994) that the developing countries should divert resources away from industry to agriculture in which they have a comparative advantage, and that they should export agricultural commodities. In order to give some substance to our arguments and views we present some empirical evidence on the factors that determine the exports of an agricultural commodity, tea, for which India has enjoyed a position of comparative advantage for a long time. In view of the discussion presented above the following issues need to be examined:

- (1) What factors determine the performance of Indian tea exports?
- (2) What is the long-term relation between tea exports and its determinants which is devoid of any spurious correlations?
- (3) Are the tea exports responsive to changes in world price for tea and the exchange rate?
- (4) What are the long-term trends in production, domestic consumption and exports of tea in India?
- (5) Is there a perfect competition in tea trade

or is the trade confined to a few trading centres and a few trading countries?

- (6) What is the degree of competition or collusion in international tea trade in terms of market linkages as evidenced by prices for tea prevailing at various international markets?
- (7) Are domestic prices of tea affected by the world price for tea? Is the domestic price of tea increasing or decreasing over time as a result of trade and changes in the exchange rate?
- (8) What are the institutional factors that are specific to India's tea production and tea exports that have bearing on tea exports?

FIGURE 1 INDIAN TEA PRODUCTION AND YIELD

We shall attempt to answer some of these questions in the rest of the paper

III Profile of India's Tea Production, Consumption and Trade

Indian tea industry has enjoyed a prominent place in the world. The history of the Indian tea industry up to the dawn of independence can be briefly described as a case of expansion and consolidation. By 1950 tea had become an important agricultural crop of the country. It accounted for over 18 per cent of the total employment in the organised sector of the economy, 14 per cent of the country's export earning and 1.16 per cent of the Gross National Product. The area under tea cultivation was 3.15 lakh hectares and it was a major source of development in the relatively backward hilly regions of the country. In 1950 India was the largest producer and exporter of tea in the world.

Let us now examine the performance of

tea industry after 1950. Table 1 presents some facts about India's tea industry giving a major thrust to export supply factors. The area under the crop has increased from 3.15 lakh hectares to 4.25 lakh hectares registering an annual compound growth rate of 1.02 per cent. Production has increased from 278.21

thousand metric tons to 758.06 thousand metric tons, nearly a three-fold increase. The annual compound growth rate of production during last 43 years is 10.5 per cent. Fig. 1 also shows a long term increasing trend in production. Yield of tea increased from 881 kg/hect to 1784 kg/hect. Fig. 1 shows that

The cointegration regression for two variables

$$P = \alpha + \beta P + u \quad \text{and} \quad P = \alpha + \beta P + u$$

where P and P are non-stationary time series, α , α and β , β are constant and cointegrating parameter respectively.

ADF and PP test is based on one lag

the yield rate has more fluctuations than production. India's tea exports (in terms of quantity) show no trend, rather they fluctuate erratically (Fig 2). During the last 43 years exports have varied between 166.71 and 240.18 thousand metric tons. The unit value of export (expressed in Rs/kg) has significantly increased from Rs 4.01 per kg in 1950 to Rs 64.93 per kg in 1993. The price movement was sluggish between 1950 and 1973. After 1973, price increase was faster and in 1977 price was doubled compared to the price of the previous year. Taking into account the fact that exports in physical quantity did not increase with the increase in unit value of export, one may interpret that the value of the rupee was becoming cheaper, which is also supported by the fact that the unit value of tea exports are more or less stable during the fixed exchange rate regime of 1950 to 1973. India's share in total world seaport has declined very significantly from around 50 per cent to 29 per cent. Figure 3 shows a continuous decline in India's share of tea exports. On the other hand, domestic consumption of tea has increased significantly (Figure 3). The share of domestic consumption in production has gone up from 26.6 per cent to 76.7 per cent.

It may be suspected that India's tea exports are affected primarily by competition from other tea exporting countries and from a high domestic demand for tea. It may be noted that tea is a peculiar commodity for which there is only one major substitute, coffee, whose export performance also is driven by quite similar forces. An increase in population and an increase in per capita domestic consumption of tea increase the domestic demand for tea. As the rate of growth of tea production is less than the rate of growth of consumption, the ratio of domestic consumption to domestic production is increasing over time.

The declining share of India's exports needs some explanation. There are several factors that seem to explain this. First, there is increasing competition from other tea exporting countries such as Sri Lanka, Kenya, China and Indonesia. Second, domestic consumption of tea has also registered a substantial increase. Third, only good quality tea can be exported. Good quality tea is harvested when the tea plantation is approximately more than five years and less than 40 years old. There has been very little effort in India to maintain or conserve good quality tea through replantation as the cost of replantation is relatively high compared to loss in revenue due to producing and marketing a lower quality of tea in the domestic market (Tandon Committee Report p 42). A very high tax rate on income from tea cultivation is perhaps another major deterrent for increasing production and export of good quality tea.

FIGURE 2 TLA EXPORTS OF INDIA

IV India's Tea Export Performance: An Econometric Analysis

Our first attempt was to specify and estimate the tea export function for India. Employing the standard structural equation methodology associated with the financial programming approach, we estimated the tea export demand. We specified that it depends on (i) unit price in US \$, (ii) share of country's production to the total world production, (iii) total world demand for tea imports, (iv) share of domestic consumption to total production, and (v) the exchange rate (Rs/\$). One may question the use of exchange rate as an additional variable when its effect is already accounted for by the price of tea expressed in US dollars. While the term price in US \$ will reveal response of tea exports to world price for tea, the term exchange rate will show if there is any additional export incentive as a result of change in the exchange rate (usually a devaluation). The results of the estimated equations are presented in Table 2. We used annual time series data for the period 1950-93.

It may be noted that R^2 associated with the estimated equations are quite low. This inference may be examined against the fact that some of the explanatory variables such as exchange rate, India's share in world tea exports, ratio of domestic consumption in tea production have time trends while the India's tea export volume has more or less fluctuated widely around a constant mean. Only the world demand for tea and exchange

rate emerge with statistically significant coefficients. The exchange rate appears with a significant negative coefficient while the most commonly held view suggests a positive coefficient. This result may again be noted against the time series pattern – the volume of exports fluctuates around a constant mean while the exchange rate has an increasing trend. The unit value of exports (in \$ per kg) also does not have a significant coefficient. The regression specification that ignores the time series nature of the data, one could argue, may have generated spurious correlations.

The regression results reported in Table 2 do not take due account of the fact that the data used are time series. We now proceed to examine the data and the relationships between variables by noting that they are time series. First, we examine each time series and see whether it is stationary or non-stationary employing the unit root tests. If a time series is found to be non-stationary, we next examine likewise if its first difference is stationary. Using this procedure we determine the order of integration of a time series. Then we stipulate that the regression relation be between stationary variable only. If any of the variables are non-stationary, they are replaced by the appropriate difference of that variable which is stationary. Table 5 presents the results of unit root tests using the time series data from 1950-1993. The results determine the order of integration of the variables. From the table it is evident that when the variables are used in levels, India's tea exports, price in US \$ are stationary time series, while

India's share in world production, world demand for imports are integrated of order one and the exchange rate is integrated of order two. When the variables are expressed in logarithms a similar conclusion arises except that the exchange rate becomes stationary in the first difference of the logarithm.

The corresponding time series regression relation which is devoid of spurious correlations due to common time trends is given below:

$$\begin{aligned} \text{EXPORT} = & 206229.17 + 440.51 \text{ UNPRI} \\ & (24.18) \quad (0.09) \\ & - 1451.08 \Delta \text{PDSH} + 0.02 \Delta \text{WIPC} \\ & (-0.67) \quad (0.38) \\ & 222887.02 \Delta \text{CONSH} \\ & (-3.13) \\ & - 587.09 \Delta \text{EXRT} \quad (1) \\ & (0.20) \end{aligned}$$

$$\begin{aligned} R &= 0.23 \quad \text{adj } (lag=1) = -56.80 \\ PP(lag=1) &= 39.57 \end{aligned}$$

$$\begin{aligned} \text{Log(EXPORT)} = & 12.23 + 0.01 \text{ Log(UNPRI)} \\ & (511.93) \quad (0.34) \end{aligned}$$

$$\begin{aligned} & 0.17 \Delta \text{Log(PDSH)} + 0.22 \Delta \text{Log(WIPC)} \\ & (0.49) \quad (1.02) \end{aligned}$$

$$\begin{aligned} & 0.45 \Delta \text{Log(CONSH)} \\ & (-3.65) \end{aligned}$$

$$\begin{aligned} & 0.14 \Delta \text{Log(EXRT)} \quad (2) \\ & (-0.70) \end{aligned}$$

$$\begin{aligned} R &= 0.30 \quad \text{ADF } (lag=1) = -64.51 \\ PP(lag=1) &= -40.40 \end{aligned}$$

From the statistical evidence furnished above it is quite clear that India's tea exports are not influenced by any of these explanatory variables except the domestic consumption. The share of domestic consumption is increasing over time and correspondingly the exports are decreasing.

It is useful to enquire whether this poor export performance is due to the Indian tea market being not well-integrated with the other major tea markets in the world. We next examine how well the tea markets in various locations are integrated. Given the time series nature of the data we shall employ time series methods with data from 1950-1993. If markets are closely integrated with one another then prices in different markets, separated by geographic distance, must move together in time. From a time series perspective this is equivalent to stating that prices of tea in different markets, Cochin, Calcutta, Kenya, Sri Lanka, London etc. must be cointegrated pairwise. We tested this hypothesis of market integration by performing a unit-root test for non-stationarity and t-test on the bivariate regressions for cointegration. The results of our analysis are presented in Tables 4 and 5. From these tables it is clear that all the price-time series except London price are non-stationary (Table 4). To see whether

FIGURE 3 INDIAN TEA CONSUMPTION AND SHARE IN EXPORTS

these non-stationary prices move together we estimated linear relationships between them pairwise. The results are reported in Table 4. From these it follows that the two estimates of β and β' are such that 1 is bracketed between them. Similarly in some cases (Calcutta and Sri Lanka and Kenya and Calcutta) the estimates of α and α' bracket 0. These results demonstrate that various tea prices move together in time suggesting that the tea markets are well-integrated. Figure 4 presents the co-movement of tea prices in tea markets at Calcutta, Cochin, Sri Lanka and Kenya. It must be noted that this phenomenon of cointegration of prices is consistent with two widely different hypothesis one that the tea market is perfectly competitive and the other it is oligopolistic with one leader (price-setter) and all the other as followers.

V

Concluding Remarks

When a country is going through a policy reform and regime-shift it is difficult to obtain empirical support for the policy reforms from the past historical experience. However regarding the issue of exporting an essential agricultural commodity for which India has a comparative advantage we do have rich historical data, viz. experience with tea exports.

The statistical evidence presented in the previous section, based on detailed time series data on tea exports of India, suggests the distinct possibility that for all those commodities for which domestic

consumption forms a major share of domestic production and for those agricultural commodities which are essential such as tea and foodgrains, exports cannot increase in the short and medium term without an increase in production relative to consumption. But such increase in production will take a considerable time. Hence one must have a cautious policy regarding agricultural exports taking due note of domestic consumption and production response to price changes. The results reported above regarding cointegration of tea prices in domestic and international markets also suggests that by allowing free exports of agricultural commodities we are likely to raise the domestic prices of foodgrains to equal their international prices, which are higher mainly due to devaluation of the domestic currency. Thus liberalisation of agricultural trade is likely to give rise to a rise in domestic prices without a significant increase either in production or in exports.

While Hanumantha Rao and Gulati (1994) advocate export of foodgrains, our results for tea trade suggests that we should be quite cautious. Although our study refers to tea and not to foodgrains some features are quite common between them. Both are essential food items. Raj Krishna (1972), Rao (1986) and Binswanger (1989) had already warned us that production response for foodgrains in India is quite poor. Dependence on imports of essential agricultural commodities, particularly from major developed countries, will make the country vulnerable for political and economic exploitation. It is thus necessary to examine carefully a trade

FIGURE 4: PRICES. INTRA - COUNTRY COMPARISON

strategy for India which maintains food security and also generates export earnings. This suggests that trade liberalisation for agricultural commodities must be selective. One needs to examine in greater detail trade experience of developing countries with commercial agricultural crops along with trade in essential agricultural commodities. It is also necessary to examine in greater depth the relative strengths of agricultural and industrial product exports in generating sustainable export earnings. It is expected that the degree of competition is high in low-value added agricultural products whose production requires lower levels of technology and skills. The terms of trade are thus expected to be adverse to agriculture. Any attempt to redirect investment and trade away from industry to agriculture, as suggested by Hanumantha Rao and Gulati is likely to be an inefficient way to generate foreign exchange reserves to meet our import requirements. Only after having detailed

knowledge regarding relative advantages and disadvantages with respect to efficiency in export earnings and sustainable food security can one knowledgeably prescribe suitable trade policies for development. In view of this we feel that one should not take the suggestion of liberalisation of agricultural trade seriously without some more additional empirical insights.

Notes

[Based on a paper presented at the 31st Indian Econometric Conference held in May 1995 at Pune. Authors are thankful to V M Rao, Pulapre Balakrishnan, M V Nadkarni and S K Mallick for their comments. The usual caveat applies and the authors alone take responsibility for any errors that may still remain.]

1 The theory of the second best suggests, however, that if any country introduces tariffs and thus violates the first order conditions of the welfare optimum there is no sanctity to the free trade prescription for other countries. In the

international economic order that now prevails this result is worth noting

- 2 Economic and Scientific Research Association, *Growth and Potential of Tea Industry of India*, 1983, India Exchange, Calcutta, pp 13-14.
- 3 Such a large increase in yield during a forty year period could be due to technological and/or managerial improvements.

Leninism, Socialist Democracy, Contemporary Problems

Achin Vanaik

The historic impact of 1989 cannot be minimised. The very project of socialism is being questioned as never before. Disillusionment about the desirability and feasibility of a socialist alternative has never been greater. What is required today is not so much the forging of the instruments of revolution but the rehabilitation of the very idea, possibility and necessity of a socialist alternative itself.

I

AFTER 1989 there are few socialists who will doubt that any hopes for reviving the socialist project rest in large part on constructing a vision or model of socialist democracy that is both feasible and inspirational. It is a task made all the more difficult by the very nature of the revolutionary upheavals of 1989 and its aftermath in the former second world. This was the first such concatenation of upheavals that was not guided by a futuristic vision or by ideals yet to be institutionalised but by the ideals of the past. It was 1789 taking revenge on 1917 in 1989. The near universal sentiment of those who carried out or supported these upheavals was the establishment of a "normal society" by which was meant capitalist prosperity and liberal democracy. Just as universal was the belief that their societies should be subjected to "no more experiments."

Socialism, and the era inaugurated by 1917, was seen as just such an experiment, one on which history had now pronounced its final verdict of failure. For socialists the recovery of hopes for building a socialist future are indissociably linked to a recovery of our socialist past, even if a lot more than historical recovery is required. What are the goals, concepts, methods, practices and models that we must preserve? What are those we must reject? What are those we must borrow? What are those we must invent or reshape?

CENTRALITY OF RUSSIAN REVOLUTION

It is a huge agenda indeed but central to it remains the historical evaluation of the Russian revolution. This is for three reasons. First, the Russian revolution remains the inescapable point of reference for all socialist debate. Every current or tradition in socialism – Social Democratic, Stalinist, Trotskyist, Libertarian, Council Communist, Anarchist, etc – has defined itself in relation to the Russian revolution: its victors and victims, its successes and failures, its promises and deceptions, its practices and potentials, the strengths and weaknesses of its theorisations and rationalisations. Any perspective for building socialism today

cannot fail, directly or indirectly, to relate to that epochal event. For all the advantages of historical hindsight and the blase insouciances that tend to be promoted by accumulated wisdoms, we are in so many respects still to become contemporary with that past.

Second, the rejection of communism in the former second world and beyond, and of socialism in any form beyond the notion of an ameliorated liberal democratic capitalism, is directly linked with a repudiation of all that the Russian revolution stood for. Socialism in practice is seen to be Stalinism which is Leninism-Bolshevism which in turn is the meaning of the Russian revolution. The mainstream current of historical introspection in the ex-USSR has already begun to converge with the traditional right-wing and liberal orientations of Soviet historiography in the west. The staples of that historiography are well known. It is now almost impossible to deny the fact of mass revolutionary upsurge in town and countryside in Russia before, during and immediately after 1917, and has to be taken into consideration by a serious historian. But on the main interpretive questions the mainstream orthodoxy is clear.

The Bolsheviks carried out a coup though they did have some popular support. They aborted the only hope for Russia in 1917 which was the 'third way' (between Bolshevism and right-wing authoritarianism) of institutionalising a liberal democratic regime led by Kerensky or a Kerensky-like figure. Leninism/Bolshevism necessarily led to the totalitarian state because of the inherent totalitarianism of Leninism in which the premier though not the only culprit was the Leninist conception and practice of the party. After seizure of power Leninism had to and did lead to Stalinism. Restoring the historical pride of today's Russia means re-establishing a continuity with the aspirations of the pre-Bolshevik, liberal and/or Tsarist era. Since many socialists find that they agree in part or whole with this new orthodoxy in the former socialist countries, they have to decide where they stand. Was the October Revolution premature? – the view of Hobsbawm among others. Was it betrayed, either by Leninists or Stalinists or

post-Stalin revisionists? Should it never have happened? Perspectives about a desirable socialism of the future are once again linked to an assessment of the desirability and trajectory of the Russian revolution.

Third, of all the 20th century revolutions that 'succeeded' only the Russian revolution was based, however briefly, on structures of proletarian or workplace democracy that were an alternative to the basic representative forms and institutions of bourgeois democracy. Any contemporary discussion of socialist democracy must settle accounts with the lessons, negative or positive, of that experience of direct democracy via the Soviets. Should the institutions and values which have emerged through the experience of bourgeois democracy – parliament, rule of law and an independent judiciary, voluntary associations in civil society, etc – be articulated with socialist values and the organs of direct democracy, e.g. soviet-type bodies, in a context of largely socialised property relations? If so, how? Is such a project at all possible in a meaningful way for a modern functioning society?

Some of these questions will be touched upon, arising as they do from the drama of the Russian revolution. But mainly they form the backdrop and context of justification for the more specific investigative focus of the first part of this paper, which is an assessment of the widely accepted judgments of the presumed iniquity or irrelevance of Leninism for the future construction of socialism. If Stalinists and Maoists are defenders of the thesis of the continuity of Leninism and Stalinism and award a plus sign to this connection, many an anti-Stalinist while agreeing that there is a basic continuity between the two would simply reverse the value sign making it a minus. This leaves Trotskyists and some 'critical Leninists' within the broader socialist tradition to insist that there is a basic discontinuity between Leninism and Stalinism and thus to mount some kind of defence of the former while strongly repudiating the latter.

WHAT IS LENINISM?

But what is this Leninism that is to be the subject matter of investigation? A definition which confined itself simply to

Lenin's views on everything would at once be too subjective too sprawling too incoherent and yet too politically narrow. Leninism was more than Lenin. It had resonances, embodiments and influences that fully justify recognising its status as a collective current of real weight in thought and practice.

An identification of Leninism with Bolshevism is politically far too broad for it occludes the real diversities that existed within the Bolshevik party right up to the time of Lenin's death. But an identification of Leninism with mainstream Bolshevism (S. Farber's option) also begs too many questions especially since the method for determining what is mainstream Bolshevism is usually tautological [Farber 1990]. Those tendencies which were authoritarian constituted mainstream Bolshevism/Leninism which was not surprisingly then considered responsible for the rise of authoritarianism. The judgment of what was authoritarian in essence or tendency is based on the abusive use of the privilege of historical hindsight [Mandel 1972]. Considering that Leninist views on crucial matters were often in a minority within the party the consistent identification of it with the 'mainstream' is made all the more problematic.

There is a plausible way out of this apparent definitional impasse. Lenin was, above all, a political thinker and leader. Among his most original and important contributions as theorist and activist leader were those regarding the question of power, more precisely state power. The core of Leninism is constituted, above all, as a more or less systematic set of orientations towards the seizure of state power, the conceptualisation of the post-revolutionary proletarian state and the exercise of state power. This more or less systematic set of orientations was in the main held and propagated by Lenin. They were supplemented and developed by other Bolshevik leaders and thinkers, most notably Trotsky. They were endorsed and supported by others within and outside the Bolshevik party thereby constituting the umbra and penumbra of Leninism.

A coherent pattern can now be lent to the investigation of Leninism. It is the study of Leninism out of power, trying to promote and achieve the revolutionary seizure of state power, i.e. the Leninist concept and practice of the vanguard proletarian party. It is the study of the Leninist concept of the proletarian state that must be built on the ruins of the bourgeois state, i.e. the vision embodied in *State and Revolution*. It is the study of Leninism in power, its practices and the rationalisations and the theorisations of that practice.

The collapse of communism in the ex-USSR, the opening up of hitherto secret archives have not so far suggested any

dramatic new facts that might radically overturn the existing field of arguments and theories about the Russian revolution and the Bolshevik era. The key disputations will most likely remain those of an interpretive nature notwithstanding whatever new facts may be uncovered. By January 1924 (the time of Lenin's death) the scenario was very different from what it was in October 1917. Soviet democracy no longer existed, the single party state had been institutionalised, the trade unions had been subordinated to party control, all major oppositional currents within the ruling party tamed or defeated. Who can doubt or dispute that many of the seeds of Stalinism were thereby laid and that Leninism had contributed to this seeding?

But this is clearly not enough as Victor Serge would remind us. It is often said that the germ of all Stalinism was in Bolshevism at its beginning. Well, I have no objection. Only Bolshevism also contained many other germs, a mass of other germs, and those who lived through the enthusiasm of the first years of the first victorious revolution ought not to forget it. To judge the living man by the death germs which the autopsy reveals in the corpse, and which he may have carried with him since birth, is this very sensible? [Serge 1963]

LENINISM IN POWER

Understanding the process of authoritarian degeneration between 1917-23 (and assigning responsibilities for it) requires not just the recognition of a number of contributory factors but a confident grasp of the explanatory matrix in which they are to be inserted. First and foremost, what is the balance of responsibility that is to be accorded to objective pressures and constraints and to subjective possibilities and policies for explaining the process of degeneration? There is no consensus on this dialectic of the objective-subjective, only competing theories. Evaluation of the iniquity or otherwise, or of the degree of iniquity of Leninism is critically dependent on the balance that is struck between the weight accorded to objective and subjective factors in determining single events and of the general course of events.

In this respect the years 1917-23 can and should be broken up into two periods, 1917-21 and 1921-23. While one is far from condoning all that the Leninist leadership of government and party did in this first period, the weight of objective factors – famine, the profound economic dislocation of the fastest and most uncontrolled demobilisation in modern history, the civil war and its imperatives, the physical decimation of the proletariat, the progressive erosion of the worker-peasant alliance, the failure of the revolution to spread to Europe was enormous. It explains and often (though

not always) justifies the policies of the Leninist leadership.

By the same token, in the period 1921-23 after the civil war had ended, the continuing acceleration of authoritarian degeneration implicates Leninism more seriously [Mandel 1992]. Lenin, Trotsky and their supporters acted on the false assumption that greater concentration of power in the party-state was now more necessary than ever before because the threat to the dictatorship of the proletariat (by now increasingly identified with the dictatorship of the ruling party) was even greater, i.e. the possibility of the restoration of the class power of the bourgeoisie was now stronger. It is striking that in his last months Lenin increasingly obsessed with the dangers of a growing bureaucracy could only advocate measures for enhancing internal party democracy. This emphasis on enhancing internal party democracy as the key move to prevent further bureaucratic degeneration and authoritarian involution of the Soviet state and society was both realistic and ironic. Realistic because by 1922-23 there were no other institutions outside the party which could be called upon to launch a democratic counter-attack. Irony because the failure to encourage the survival and independent existence of non-party organisations, indeed their erosion, was partly traceable to the subjective failings of Leninism in power.

Secondly, while many of the measures we would regard as authoritarian may have been contingently justified by the exigencies of the time (and were in many cases viewed as temporary) what was totally unjustified was the attempt, particularly by Lenin and Trotsky, to provide a longer term rationale for such actions. It is here that the strongest criticism of the negative long term implications and consequences of Leninism (in power) resides. It is here, in the effort to justify a substitutionist vanguardism, the party substituting for the working class vanguard substituting for the class substituting for the mass – that the criticisms of Leninist vanguardism are most telling and apt.

Thirdly, there were certain areas of theoretico-political darkness which were common to all socialist currents inside and outside the Bolshevik party notwithstanding that this or that particular current may have held more appropriate democratic positions on this or that specific issue. The two most important such areas of darkness were (a) the utter inadequacy of any worked out and feasible perspective of how to move towards a national-level and highly co-ordinated system of democratic planning. Much of the impetus towards excessive centralisation of state power corresponded to economic imperatives. *Ad hoc* proposals for greater workers' control and autonomy at the enterprise level, e.g. by the workers'

opposition, while useful in themselves were very far from coping with this blindspot' (b) The notion of a proletarian democracy was politically nebulous, underdeveloped and institutionally underdetermined. Here if anything, Leninism (through the insights of *State and Revolution*) made more of a contribution to brightening this area of darkness than any other current, though it too was far from adequate.

But the point here is that these blindnesses were not distinctive failings of Leninism as such but were general failings of the much wider tradition of Marxism. That is precisely why decades after 1917 these remain the two principal problem areas facing any effort at reconstructing the socialist project on stronger foundations.

Assessing the contribution of Leninism in power to the institutionalisation of Stalinism and all that this means in regard to the state bureaucracy and democracy is thus a much more difficult problem than anti Leninists are prone to make out. After the civil war despite the growing and greater popularity of Mensheviks relative to Bolsheviks in many parts of the USSR at no point did socialist forces together command a popular (majority) following. The central choice posed therefore was never of having in power this or that more democratic socialist current *vis à vis* the Bolsheviks but of supporting Bolshevik power or accepting a bourgeois restoration and thus the immediate repudiation of what the Russian revolution stood for. This is not pointed out to rationalise Bolshevik deficiencies but simply to establish what the central battle-lines of the time were. Few socialists at the time, rightly so, were prepared to go so far as to endorse such a restoration in the name of acceding to the wishes of a majority. Most hoped that a combination of objective and subjective improvement in the USSR and worldwide would re-establish popular support for socialist (anti bourgeois) forces. To argue in the light of today that the Bolsheviks should have given up power to bourgeois restorationism after the civil war is simply another species of the 'abusive use of the privilege of historical hindsight' referred to earlier. It was not in any case an option that any Bolshevik would consider and rightly so, given the unforeseeable and open character of history and possible future outcomes.

Yet clearly, all said and done, this period of Leninism offers little positive for us today and for the future. The lessons to be learnt from Leninism in power are two-fold. For the purposes of historical evaluation, the charge of extreme or grave iniquity against it is not justified. But serious criticism and outright repudiation of some of its policies and theoretical rationalisations is most certainly justified. As for its putative and unbroken continuity with Stalinism the

charge is wrong. It cannot be made to stand simply on the basis of an examination of the record of Leninism in power.

Much more is required to make such a charge stick and bourgeois critics of Leninism and anti Leninists within the socialist fold recognise as much. If a basic line of continuity can be established between Leninism in power and Leninism out of power then their case becomes immeasurably stronger. The practices and perspectives of Leninism in power are too scattered, its goals too diverse. Objective constraints and exigent pressures intrude far too often. Five years of Leninism in power is too short a period in the whole lifespan of Leninism to be the basis of a convincing verdict on its character. All the more so since Lenin never expected (before the February Revolution) to see a successful revolution in his lifetime, never had reason to theoretically prepare himself or the party for rule after a successful revolution, could only respond pragmatically to a whole stack of unforeseen problems and issues of governance once having achieved power. It is not without reason that in power Lenin was fond of repeating Napoleon's dictum:

We shall fight and then we shall see. It was a credo whose force he must have felt all the more acutely when there was no international spread of the revolution to come to the rescue of the Soviet Union under the Bolshevik rule.

LENINISM OUT OF POWER

The search for lines of continuity between pre- and post October Leninism has taken two roads. Far and away the most travelled road is the one that claims to link up the post October authoritarian state with the pre October authoritarian party of Leninist inspiration and design. The substitutionism of the party for the state after October has its roots above all in the inherent elitism and substitutionist impulses of the Leninist concept of the vanguard party whose founding text was *What Is to Be Done?* Vanguardism, Jacobinism and democratic centralism were the original sins of Leninism, the ineradicable marks of Cain on the visage of Leninism which provide the crucial connections via the Bolshevik party's ethos and structure between Leninism out of power, Leninism in power and eventually Stalinism.

If there is one lesson for us in regard to issues concerning the state, bureaucracy and democracy it is that in the preparation for socialist transformation of the bourgeois state in the struggle for power, Leninist vanguardism and democratic centralism must be eschewed at all costs. Despite the large and growing popularity of this line of argument there are immense, indeed insuperable, difficulties for all those, including some highly sophisticated Marxist and socialist scholars, who uphold this thesis of Leninist substitutionism.

It is based on a flawed understanding of vanguardism and of democratic centralism. It cannot be sustained by reference to text nor to context. In the heat of the revolutionary upsurge in 1917 when the Leninist concept of organisation was put to its decisive test, it simply did not behave in the Jacobinist/ elitist/ undemocratic manipulative way it was presumably doomed to do. It grew ten fold in six months. It was a highly decentralised party able to respond with remarkable flexibility to mass sentiments, moods and actions. It was certainly a more disciplined force than any other rival or allied party. But it was also more open, democratic and flexible. It was rooted in the urban working class but not more so than the Mensheviks. It was able to attract the more militant sections of that working class throughout 1917 above all because of its political superiority to other parties. The charge that the Bolsheviks carried out a coup deliberately or otherwise confuses the necessarily secretive and closed character of decision making in regard to military preparations or of planning and executing the decisive phases of armed insurrection with a false political characterisation or imputation of acting without very significant popular and growing mass support and approval. This charge is routinely made in right wing and liberal Soviet historiography. It has attracted some left wing anti Leninist analysts as well.

Those who would draw a line of continuity between the pre- and post October Leninist party have another huge problem. How are they to evaluate Lenin's *State and Revolution* written during the very heat of the revolutionary struggle? On the eve of the preparation of the seizure of power, Lenin writes his most utopian 'anarchist', libertarian text which barely mentions the word party! So out of kilter is this with the image of Lenin as arch Jacobinist and elitist manipulator or theorist *par excellence* of the party that almost all those who uphold the thesis of Leninist substitutionism are forced to regard this text and the timing of its authorship as an aberration, an inexplicable departure from the truer or more authentic Lenin. Or else explain it as a piece of self-conscious deceitfulness aimed at pulling the wool over the eyes of opponents and doubters of Bolshevikism in its drive to power under his stewardship. Since the text was only published in 1918 this last charge is absurd.

Yet the explanation of its content and timing is simple and straightforward enough. Like all Lenin's writings it was practically motivated by the political needs and exigencies of the time as he saw them. On the eve of the revolutionary seizure of power what was needed was not a utopian text but some kind of blueprint however rough for the constructing of the new proletarian state. It was to that eminently practical task that *State and Revolution* was addressed. It had

little place for the Bolshevik or any party because, contrary to the falsehood that for Lenin the dictatorship of the proletariat was always centrally pivoted on the dictatorship of the party he held at the time when the problem of constructing a proletarian state loomed largest, the very opposite view.⁴

Far from there being a theoretical line of continuity between the belief in the necessity of the vanguard party before seizure of power and in its necessity after the seizure, the most important hallmark of Leninist thinking was its belief in the necessity of a rupture in this supposed continuity. This is not in the least difficult to understand. The party, any party, is above all an instrument for the fulfilment of certain tasks. When the fundamental character of the tasks change the character of the instruments required to carry out these tasks must be forged anew. For a bourgeois party operating within the structures and institutions of state power to which the bourgeois party is itself committed to preserving and continuing, the party out of power can organise itself not just for peaceful accession to governmental power but even for anticipating and carrying out the responsibilities of governance. There is no rupture in its organisational character or programmatic self-perception whether in or out of power, hence, for example, the acceptability of the practice of forming a 'shadow cabinet'.

This is eminently not the case with revolutionary parties preparing for revolutionary seizures of power because subsequent revolutionary transformation of state and society are tasks that by definition go so far beyond the capabilities of any single political party that the very nature of the role of the party (whether vanguard or otherwise) must be assessed anew. The content of Lenin's *State and Revolution*, its plausibility and practical value in the eyes of its own believers, rested on the widely held assumption of Bolsheviks of the time that a successful Russian revolution would trigger off a chain of successful revolutions elsewhere, above all in Germany where the much more advanced German working class with its much denser network of protective organisations and structures, would surely lead the way in what would become an extra-national process of revolutionary transformation and consolidation. The silence of *State and Revolution* on the role of the party in the proletarian state is no aberration but concrete evidence of the absence of serious substitutionist impulses in Leninism out of power or before power.

The undeniable substitutionism of Leninism in power have no important roots in Leninism out of power or in the Leninist concept of the party before October. But the vanguard party so central to the success of October 1917 was to undergo a decisive transmutation after October 1917 when the

objective premises of *State and Revolution*, of Leninist and other Bolshevik views on how to go about constructing the new proletarian state were largely shattered. Nor did occasional Leninist rationalisations after 1917 seeking to establish a line of continuity between pre- and post-October Bolshevism (using the legitimacy and prestige of the former to sustain the latter) help matters in any way.

What are the contemporary or enduring lessons to be derived from this historical defence of the Leninist concept of the vanguard party? The accusation of iniquity against it is frankly untenable. It is not the original or inevitable source of bureaucratisation or of Stalinism. It leads not to the most undemocratic form of party organisation, but in fact to the most democratic form of party organisation, if the principles that underlie it are properly understood and applied, e.g. when tendency and faction rights within a party are institutionalised.⁵

The notion of vanguard organisation (the precise forms that such vanguard organisation can take, e.g. party or front, are variable) retains an enduring relevance. This is because the bourgeois state in *all* its forms is itself the *vanguard organisation* of the dominant class(es). The revolutionary vanguard organisation is the precise counterpoint to the bourgeois state, the most effective weapon with which to confront and defeat it.

LENINIST STRATEGY FOR SEIZURE OF POWER

But there is also another charge against the Leninist party. It is the charge of contemporary irrelevance. The concept of vanguard organisation is said to be linked to a particular notion of revolutionary crisis and a particular notion of revolutionary strategy, namely, insurrectionism. Since most advanced capitalist societies have a more developed and denser liberal democratic state, such an insurrectionist strategy is not considered viable in such societies. The cruder version of this argument identifies the 'Leninist' strategy for seizure of power with the goal of insurrectionism. This is inaccurate. The centerpiece of the Leninist strategy is the principle of *dual power* which may or may not culminate in an explosive urban insurrectionism as the final act tipping the scales, as it were. In many third world countries, Leninist strategies are not under that serious fire from within the ranks of the left. It is in bourgeois democracies that the Leninist strategy is more seriously questioned.

Norman Geras has discussed lucidly the two main strategic perspectives for revolution in advanced or stable bourgeois democracies: what he calls the 'gateway' and 'bastion' hypotheses [Geras 1990:51-55]. The first argues that the road to social revolution runs

through the institutions of bourgeois democracy. The second argues that this is possible only up to a point beyond which the route is blocked and the bourgeois democratic state reveals its essential character as a 'bastion' or 'fortress' against social revolution. This bastion must be defeated, destroyed or fatally weakened.

A debate between H. Weber and N. Poulantzas clarified the alternatives in a similar way [Weber and Poulantzas 1977:3-12]. The issue, as Poulantzas himself realised, was not an insurrectionist strategy versus a non-insurrectionist one. It had to do with the precise articulation and relationship between two terrains of struggle, that waged within the existing institutions of bourgeois democracy, and that waged outside it. The non- or anti-Leninist socialists sometimes helped by a particular reading of Gramsci located the decisive terrain of struggle within existing institutions. The Leninist perspective argues not for counterposing the two terrains of struggle and choosing one or the other, but insists that at some point in the struggle within existing institutions (well below the 'critical point') the key centres of power and their power wielders will polarise to the right, and the strategy of capture or transformation of the bourgeois state from within can go no further. The decisive terrain of struggle lies outside, between the 'core' sectors – the top echelons of civil bureaucracy, of the courts, of the executive and the military – of the bourgeois state, and the embryonic and emerging organs of an alternative state, i.e. the emergence of a dual power situation which has to be resolved one way or the other, and to which the struggle within existing institutions is a very important complement.

The second strategy, in effect, insists not just on combining the 'war of position' and the 'war of manoeuvre' (the first strategy can also say as much) but that the possibility of ruthless bourgeois repression in the end game situation even in advanced bourgeois democracies must be allowed for and prepared for. In short, the bastion strategy is more comprehensive and farsighted because it acknowledges and seeks to prepare for a possibility (of a violent showdown) which the gateway strategy refuses to entertain. Or as Geras puts it, "Each now comprehends as is necessary in the given context for any minimally serious strategic approach, both a parliamentary and an extra-parliamentary dimension to socialist revolution, both a continuity and discontinuity of political forms. But they still differ, and critically in this: the former hypothesis [the gateway hypothesis] forbids what the latter one countenances, a point of constitutional rupture. For, in the 'gateway' view socialist transformation must, while in the 'bastion' view it need not, derive its

legitimacy from the parliamentary source" [Geras 1990:54-55].

Robin Blackburn has suggested that revolutions of the Russian type no longer offer us a serious model for strategic purposes. He argues that the special conditions of a "crumbling feudal Absolutist order", its weakness of parliamentary-type representative institutions is what enabled Soviet-type institutions to emerge and secure a near-monopoly of "general political representation". In short, that the experience of dual power as in Russia must be considered exceptional. The Leninist strategy for seizure of power to which the Leninist conception of a workers vanguard party is tied, is thus of increasing irrelevance except perhaps where bourgeois democratic institutions are very weak or non-existent [Blackburn 1992].

The least that can be said about this view is that the jury is still out. Every major revolutionary process at least when it has reached the point of a pre-revolutionary crisis witnessed the emergence in some form – embryonic, infant or adolescent – of organs of direct democracy and rule, i.e. organs of potential or actual dual power. This was so, as John Rees correctly notes in his rebuttal of Blackburn, the case in 1919-23 Germany, in the Finnish Revolution of 1918, in Bela Kun's Hungary, in Spain in 1936, in Portugal in 1974-75, in Chile (a country which had perhaps the strongest tradition of bourgeois democracy outside the advanced capitalist world) in 1972-73 [Rees 1992].

However, there is a hidden nugget of perception in Blackburn's argument which needs to be excavated. Soviet-type bodies were based primarily on workplace representation. They were quintessentially the expressive organs of worker or producer interests. Their level of strategic importance corresponds closely to the level of strategic importance of the working class. Some notion of vanguard organisation may indeed be indispensable as long as the bourgeois state exists and needs to be confronted. But how necessary is it that we strategically focus on the creation and consolidation of a vanguard *working class* party? Is this not outmoded? Insofar as the Leninist party meant not just a vanguard organisation but a vanguard workers organisation, is not its time largely up? Not so much because of its presumed iniquity or vanguardism, or its supposedly faulty strategic commitment to dual power, but because of the profound politico-strategic implications of the transformation of the proletariat and the working class movement in the era of late capitalism? What is being criticised as irrelevant here, it should be noted, is not specifically the 'Leninist strategy' but the broader category of working class-centred political strategies for socialist transformation of which Leninism is a distinct sub-category.

The classical vision of the role of the proletariat as the 'universal class', the strategic actor in the struggle for socialist revolution has not been disproved. But it has been rendered more problematic. The working class both would and could make the revolution. It would, because its 'objective' interests drove it to want to do so. It could, because (a) it was at one and the same time the majority in an industrialised society as well as being strategically located at the heart of production; (b) the very processes of capitalist production would, on balance, objectively reinforce its sense of collectivity and its status as an increasingly self-aware collective actor.

But in late capitalism two developments have greatly disturbed the classical perception of the role, direction and capacities of the proletariat. First, the ethical or subjective inspiration for committing to the socialist project has become relatively more important compared to the motivations that would seem to more 'naturally' flow from one's 'objective material interests'. As such, groups and individuals ethically committed to socialism, whatever their class position, have become more important. The actors which have done most to transform post-1945 capitalism, have been the 'new social movements' based on identities other than class. These movements have been motivated by other than class interests, often by moral outrage and by their determination to subvert 'accepted' cultural meanings and values. These social movements may not substitute for the role of the working class in the overall socialist project but significant currents within them cannot be ignored. They must be part of the combination of agencies/actors that strive for socialism and whose consolidation is a primary strategic-political task. Second, the increasing segmentation and differentiation within the working class has made the organisation of even elementary class unity and independence considerably more difficult and complicated.

The overall result is a diminution of the importance of the industrial working class and therefore of all theoretical-political strategies which implicitly or explicitly have had just this working class at the heart of its strategic perspective. The Leninist concept of the vanguard working class party was one such strategic perspective. It was premised on the centrality, progressively so, of the working class (and of the industrial working class component within the wider category of wage earners) to the strategic alignment of forces fighting on the revolutionary battlefield.

If the Leninist concept of the party needs to be carefully reassessed (though not casually discarded) it is because the role, inclinations and capacities of the working class in late capitalism needs to be carefully reassessed. Furthermore, the kind of socialist

organisations that are required at any point of time is always connected to the kind of tasks required to be carried out.

The historic impact of 1989 cannot be minimised. The very project of socialism being questioned as never before. Disillusionment about the desirability and feasibility of a socialist alternative has never been greater. For the first time since Marx and the rise of industrial capitalism there is a sense that the big forces of history are no longer moving "our way". Never before has Lukacs's notion of the "actuality of the revolution", by which was surely also meant its immediacy, seemed more remote and unreal.

What is required today is not so much the forging of the instruments of revolution but the rehabilitation of the very idea, possibility and necessity of a socialist alternative itself. It is, in short, time for a much more ecumenical approach by all currents with the broad socialist tradition. Leninist currents can and must be a part of the constructive team for consolidating just such an ecumenism. The organisations that will be most conducive to this task are likely to be more and politically more eclectic and diffuse than vanguard structures. This is not a demand for the dissolution of the latter, nor an assertion of their historic irrelevance. But it is to suggest that the primary task confronting socialists today to which Leninists among many can contribute, is other than a single minded or exclusive emphasis on the construction of vanguard political formations. Leninists must learn to work 'pre-Leninist' or 'non-Leninist times, as were.

THE 'LENINIST' STATE

Let us return, however, to the other route traversed by anti-Leninists, *albeit* by very few. Travellers on this route put the onus for the emergence of post-October authoritarianism not on the Leninist concept of the party, i.e. not on the thesis of substitutionism, but on the Leninist concept of the state, i.e. on the presumably an liberation authoritarian thrust of *State and Revolution*. Easily the most important systematic proponent of this line of argument has been A.J. Polan, although echoes of it are found elsewhere among the critics of the authoritarian dangers of Marxist utopianism.

What Polan has done is to go one step further – to attack not so much 19th century Marxist utopianism but Leninist utopianism as it sought to advance and develop Marx's concept of the commune-state. In attacking Leninism as its strongest point, his very vision of an alternative to the bourgeois state and to bourgeois democracy. The purpose of Polan's assault is not spelled out but it is clear enough to defend bourgeois democracy as essentially untranscendable.

But his way of carrying out this assault

is consciously anti-historical. He refuses to see the writing of *State and Revolution* as practically motivated and thus has no explanation for the 'puzzle' of why it was written, when it was. Unlike others who argue that the problem of Leninism in power was that it was insufficiently guided by the principles and values of the text; or others who insist that it was the rapid failure of its attempted implementation and its increasingly obvious inapplicability that consigned it to the theoretical closet, Polan argues for an altogether different link between text and context, between Leninist precepts and Leninist practice.

His argument allows him to ignore the study of context altogether and to confine himself to the 'purity' of the text, and thus to Leninism unsullied by practice. The link he postulates is one of "cultural effect" between the text and subsequent events, i.e., the creation of an ethos or spirit that 'infused' the politics or rather anti-politics of Leninism in power. Polan is thus absolved of the responsibility of having to show how the principles embodied in *State and Revolution* were causally related to specific authoritarian policies of the post-October government. The argument is conducted on a more ethereal plane impervious to empirical refutation or confirmation.

But this method which clearly makes for bad history is also in a key respect more relevant for contemporary purposes. It helps Polan to concentrate on crucial questions concerning the feasibility and desirability of a proletarian state and of proletarian democracy. The principles and values embodied in Lenin's *State and Revolution* are ones which most anarchists, libertarians, Trotskyists, and many other kinds of anti-Stalinist socialists would still uphold in their quest for a qualitatively superior form of democracy than that existing anywhere today. In this sense the conception of the state elaborated upon by Lenin in *State and Revolution* is not strictly identified or widely seen as 'Leninist'. Polan seeks to show the iniquity and irrelevance of these principles and values and of the institutional recommendations and biases that flow from them. First, he attacks the philosophical foundations of direct democracy and the commune-state which he believes is based on the totalitarian impulses of 'general will' theory. By contrast all democracy means "discursive will formation" which is only possible in a "polity that is composed of voluntary associations of individuals who are legally constituted as trans-situational citizens..." Any notion of a viable and more primary producer democracy is a dangerous chimera, as also the striving for an asymptotic convergence of state and civil society.

Second, he attacks any notion of the possibility or desirability of a 'withering away' of the bureaucracy. All modern

societies, contrary to Leninist or Marxist intuitions, must involve the deepening and consolidation of the bureaucracy as a social layer and must recognise the abiding worth of bureaucratic expertise. Weber is strongly counterposed to Lenin. All one can do about the bureaucracy is to control and check it. It cannot be progressively eroded nor its functions usurped through 'self-administration'.

Third, all attempts to replace indirect forms of representation and authority by more direct and mandated forms of representation and authorisation are a recipe for disaster. One of its most pernicious consequences is the attempted conflation of legislature and executive functions at different levels. But to so conflate legislator, civil servant, minister and critic is absurd, impossible and dangerous. A direct democracy has no space for the opposition to behave simply as opposition. Fourth, the commune-state is not federalist, as it should be, but is centralist and therefore always more open to an abusive centralisation of power.

The force of these criticisms is a real one. But Polan spoils his case by an excess of zeal and a narrowness of vision. For him the search for a better democracy than the socially and economically iniquitous and the politically elitist democracy of bourgeois society is a fruitless one. There is no point in wasting one's time in modelling an alternative democracy even at the theoretical or intellectual level. For him, the only lesson of the Leninist and Marxist past is not the need to elaborate, modify or discard from the stock of themes regarding democracy, state and bureaucracy that constitute our socialist tradition, but simply and categorically to reject it altogether. That is why his book is not entitled *Lenin and the Underdevelopment of Politics*, a reasonable and more accurate charge, but *Lenin and the End of Politics*, a caricature and a canard.

We can at this point in this paper take leave of Polan and Leninism though reminding ourselves that we must nonetheless build on the legacy of classical Marxism – the lineage that runs through Marx, Engels, Lenin, Luxemburg, Trotsky and Gramsci – as well as on the bequests of other currents within the socialist movement. The crucial intellectual project that faces us today is drawing up an alternative model of democracy. The crucial political project will be to try and convince hundreds of millions that such a model is not just workable but worth the risks of fighting aggressively and continuously for it.

Only some general observations will be made concerning the first of these: the intellectual task of drawing a rough blueprint of a socialist democracy transcending capitalist liberal democracy. For those who would still cling to Marx's view that we cannot and should not attempt to draw even

the roughest of blueprints, one can only reply that "times have changed". This is one opinion however hallowed by its descent from Marx, that must be firmly contradicted. We do have to try and compose in advance some of the 'music of the future'.

II

The construction of a desirable alternative model to bourgeois democracy is perhaps the easier of the tasks confronting socialists. Feasibility has two aspects. The first concerns the workability of an alternative model, its plausibility of functioning. Indeed, the desirability of an alternative is greatly enhanced if it can persuade of its workability. The second aspect is the most important and the one that this paper in its concluding reflections on matters pertaining to the state, bureaucracy and democracy will not touch. This is the problem of the feasibility of means, of reachability rather than workability. This is the realm of political strategy. One has in mind here the bourgeois democracies. It is here that a superior model of democracy is likely to be established both in the course and as a result of a successful socialist revolution. And it is in these very societies that the difficulty of making a successful socialist revolution has been greatest.

C. B. Macpherson is surely right when he reminds us that if we are able to resolve the key problems of how to reach this model of superior democracy, i.e. carry out a successful socialist revolution in existing bourgeois democracies, especially in the advanced ones, then we will have gone a long way in overcoming the problems regarding how to run such a model of democracy [Macpherson 1977:98].

In what follows only some brief general principles will be put forward to defend the idea of an alternative socialist democracy by engagement with some counter arguments thrown up by those who claim that advanced capitalist liberal democracy barring some minor reforms is untranscendable. The necessity of a socialist transition is taken for granted. No sustained arguments are put for why this is so. But do we need to remind ourselves that gross global inequalities, the existence of mass-scale privations and the impossibility of an economic system based on the 'law of Moses', i.e. constantly expanding accumulation of capital, to cope adequately with global ecological problems, should be reasons enough to confirm the validity and urgency of this search for a societal alternative to capitalism?

PHILOSOPHICAL RATIONALE

Liberal democracy which concentrates on political democracy and political rights to the exclusion of basic social and economic 'rights' and of social and economic democracy, rests on the philosophical

argument that negative freedom is the main kind of freedom that should be pursued and defended. Attempts to pursue and defend positive freedom (i.e., a notion of freedom that goes beyond the liberal idea of restricting the state from interfering with the 'liberty' of citizens), to argue for the enhancement and fulfilment of the goals of all around self-development, individual capacities, social and self-mastery, will lead to disaster. Freedom (understood as negative freedom) is largely counterposed to equality in contrast to the radical socialist view that equality is central to any meaningful notion of freedom. Indeed strong equality is said to be vital for strong freedom.

At the philosophical level the defence of the need for and superior worth of positive freedom and its equal distribution is hardly a problem. Nor is it possible to carry on with the view that freedom and equality are to be traded off against each other. All notions of freedom involve an inescapable and central commitment to some kind of equality. As Amartya Sen points out, they differ in regard to 'equality of what'? [Sen 1984, 1992; Gould 1990].

SOME CONTEMPORARY QUESTIONS

Classical marxism was committed to the notion that it was necessary and possible for there to be the progressive withering away of the bureaucracy, the state, the market, private property relations, and market relations like money, the commodity form, etc. Moreover, there could and should be the progressive convergence of state and civil society. This is in direct contrast to the fundamental axioms of capitalist liberal democracy. The bureaucracy endures and grows as society advances industrially and it is desirable that this happens. But the dangers of bureaucratic growth and power must be checked and controlled.

The market far from withering away must endure and prosper. It is, along with private property relations, the economic bedrock for the existence of a separated political democracy. The state cannot progressively wither away though its role should be defined clearly either as the minimal state of right-wing conservatives or the welfarist state of liberal persuasion. State and society must remain apart as separate domains though the former encroaches on the latter.

Who is more right? Is it feasible or desirable to want or strive for the 'withering away' of state, market, private property in the means of production, the bureaucracy, and to try and merge state and society? The lessons of 72 years of 'actually existing socialism' would suggest an 'in-between solution'. The idea of the withering away of state, bureaucracy, all private property relations, and the market is a useful signpost to show the direction that contemporary societies must move in. That is to say, the scope of

three – state, bureaucracy, private property relations – can and should be significantly reduced, qualitatively so from the levels that exist today. On the fourth, the market, the case is more uncertain and clouded.

Certainly the classical vision of a constant or continuous process of withering away of state, bureaucracy and market seems neither feasible nor desirable. Some minimum level of state, bureaucracy and market relations/money seems unavoidable. The classical perspective rested on the assumption that the overcoming of scarcity, i.e., abundance was possible. This notion of abundance was never an absolute one. It meant a saturation of most needs where a hierarchy of needs was postulated. The more recent and widespread recognition of the existence of 'population limits' (something that the classical view has consistently ignored or rejected) suggests that any socialism that emerges on a global scale will have to content itself with, on average, lower levels of industrialisation and lower levels of consumption than exist in the advanced capitalist countries.

In short, socialism will probably have to be much more a conscious ethical choice than something that emerges out of the institution of an economic system which promises greater productivity than capitalism. One is not advocating Mao's 'socialism of austerity'. One is taking of a 'socialism of comfort' with an average work week that is halved from the prevailing norm. But this level of comfort if it is to be globally generalised will have to involve a lowering of mass consumption standards already reached in the west and Japan.

In the classical vision, abundance was not a physical notion but a psychological one. But it was always assumed that this 'psychological revolution' of life under socialism-communism had its material roots in the superior productivity and more plentiful production and availability of goods and services than under even advanced capitalism. It is this link that now needs to be reconsidered. The 'psychological revolution' is now perhaps as much the precondition for the institution of socialism than just the 'natural' accompaniment of the consolidation of a socialist economic system.

THE BUREAUCRACY

The great strength of Weber's theory of the bureaucracy was his willingness to address the growing complexity of modern life, both in the economic and political spheres. He saw much of the impetus for the emergence and consolidation of the bureaucracy in its technical superiority to other systems of co-ordinated decision-making. He could thus provide insight on the substantial autonomy of the bureaucracy and on its 'inevitability' in any modern

society. Unlike the classical Marxist tradition then, Weberians were much less likely to underestimate the importance of the bureaucracy and the difficulty of replacing it by more direct forms of self-administration. The history of so called socialist regimes suggests that Weber was more prescient and perceptive on this score than Marx or Lenin.

But Weber's great weakness was his refusal to imbricate his theory of the bureaucracy in a theory of class power and thereby open up recognition of the possibility that a decline in or elimination of the latter could lead to a decline of the former. Indeed, Weber would insist that only a regime of private property could provide a major check on the bureaucracy. Weber and Schumpeter rejected the notion of the state as the embodiment of popular sovereignty and saw democracy as simply the method or procedure for restricting and periodically replacing political authority which must necessarily be invested in the career party politician. Such a democracy can never go beyond the bounds of a competitive elitism. Modern life is the coeval rule of the technical expert and the career politician, and cannot really be anything else. Weber, in effect, outlaws the possibility of radical political, social and economic changes, and by so doing scotches all efforts to expand the realm of democracy and self-administration in these spheres.

Weber recognises the tension between bureaucracy and democracy but gives a final 'resolution' to it. There is no prospect of qualitatively enhancing democracy. At its core, Weber sees the root source of the bureaucracy in modernity's need for rational administration. But what he does not see is that this rationality does not operate in a social vacuum. It is decisively marked by wider social relations, e.g., of class power. Thus the notion of what is 'rational' is itself partly determined by class or social position and can change depending on the changing balance of class and social forces. Furthermore, even the rationality that the bureaucracy possesses for dominant classes or for itself is a partial rationality locked into a wider irrationality reflecting the basic dialectic of rationality-irrationality of capitalism itself.

The first suggests the feasibility of reducing the bureaucracy the second the desirability. But a general empirical and sociological survey of political and corporate bureaucracies over the last 50 years would indicate that there are a range of possibilities to Weber's strict top-down model of decision-making and concentration of authority and power. Both life and theory have partially transcended Weber's elitist and pessimistic vision of democracy and bureaucracy.

In its broad sweep, if not in its extreme optimism, Mandel is right to stress our ability to reduce and weaken bureaucracy

by the transformation of its political, social and economic preconditions [Mandel 1992:197-210]. Politically, the keys are (i) decentralisation of power through a combination of federal and democratic centralist (pyramidal) forms of devolution and direct democracy, and (ii) the expansion of mass access to information and the progressive reduction of spheres of secrecy. Socially, the keys are (i) the expansion of mass education and the institutionalisation of free or cheap access to high levels of learning and (ii) the dramatic reduction of the working week. Only then is it objectively possible for people to self-administrate and participate in decision-making in more and more of the areas that affect their lives, directly or indirectly. Economically, the keys are (i) the 'psychological revolution' mentioned before, and (ii) the elimination of the enormous 'waste' that accompanies capitalist production, e.g. much of advertising and retailing costs, much of the resources devoted to military expenditure, and to setting up the kind of specialised, e.g. legal and tax-accounting, services to protect the class wealth and power of the rich.

THE STATE

The central question here is the articulation of the institutions of direct and indirect democracy. This remains a grey area of debate among democratic socialists. It is no longer a question of seeking to wholly replace an indirect parliamentary system of governance with a pyramidal system of direct democracy, i.e. a Soviet-type system. This is so at least for two reasons. First, the very fact of a prolonged historical experience in many countries with some kind of a representative parliamentary system has enabled it to enjoy deep popular endorsement and commitment. Such institutions are unlikely to be 'bypassed' in the actual historical process of transition to socialist democracy. In this respect the Bolshevik experience should now be seen as an exception rather than the anticipation of a general norm.¹ Second, there has been a significant revaluation leading to greater recognition of some of the weaknesses of the Soviet or pyramidal system of direct democracy and of some of the strengths of the representative parliamentary system.

A nationally co-ordinated pyramidal system especially where countries and populations are large, can be, in practice, an extremely indirect form of democracy. Even delegate meetings especially the lower down in the pyramid you go, become extremely cumbersome because of their size, and effective policy-making and its overseeing devolves on much smaller executive committees who can wield inordinate power. At the upper levels or at the top of the pyramid, revocability by the masses at the bottom becomes very difficult because the

chain of revocation must pass through each tier in the pyramid.

There is much to be said for a direct relationship between the mass of citizens and a directly elected council/parliament/assembly at the top which can represent the former through a competitive party system. Such elected representatives should be subject to the right of recall. Furthermore, some system of checks and balances must operate. Though the judicial system should be democratised, e.g. with elected and recallable magistrates, the principle and practice of an independent judiciary, and of a binding constitution, must be preserved.

The crucial question, historically, has been where the centre of gravity of a proletarian democracy or of a state representing the 'dictatorship of the proletariat' should lie? The usual answer has been that the tilt should be to those organs that represent the individual as producer rather than as citizen. Therefore it is the Soviet-type institutions that must have primacy over the citizen-based parliament-type institutions. But this general principle leaves very much open the ways in which the distribution of authority between different institutions is to be organised. In fact, if self-administration is to be qualitatively enhanced and enacted in practice, it will mean a very significant reduction in the powers and responsibilities of national-central governance whether of the Soviet or parliamentary type. The state will not disappear but it will become weaker.

A third feature of this model of participatory democracy will be the institutionalisation of workplace democracy. At the level of the enterprise, factory or producing unit, control by direct producers is a must. Socialisation of property and workers self-management cannot mean the state deciding the mechanics of production and investment at the micro-level. Moreover, in cases where production in a unit (whether of goods or services) is not for a general market but for identifiable sets of customers/beneficiaries, then those who enjoy the goods and services must also be represented in these macro-processes of deciding what is produced? how much? etc.

Much of the above discussion remains exceedingly vague. Both limitations imposed by space and by this author's inabilities are to be blamed. But there have been attempts to develop in greater or lesser detail, the outlines of a viable model of participatory democracy combining direct and indirect institutions of democratic decision-making, plan and market, centralisation and decentralisation. These are well worth serious study [Gould 1990; Held 1987; Macpherson 1977].

THE MARKET

There have been three approaches to the question of the market under socialism. There is the classical approach which insists on the

withering away of the market as principle co-ordinator and allocator of resources. The domain of the freely distributed must grow continuously. Money must progressively disappear as a medium of payment and as store of value. Democratic planning of the economy must be institutionalised through open political processes involving pyramidal structures of congresses of different kinds of producers/consumers. A central government would retain certain macro-economic functions concerning credit, implementation of the 'broad' guidelines of a National Plan democratically selected from alternatives after nationally organised debate [Mandel 1986, 1988 and 1992].

The other two approaches can be called the 'market socialism' approach [Nove 1983] and the 'socialising of the market' approach [Elson 1988]. It is not very clear how different the third is from the second but it sees itself as a 'third way' between the first and the second avoiding the pitfalls of both and combining their respective strengths. For 'market socialists' there is either the cash nexus (market as co-ordinator) or the rules nexus (bureaucracy as co-ordinator) or some combination of the two. The first and the third approaches believe that there is a third kind of co-ordinating nexus – objective informal co-operation but differ over how to institutionalise it; whether the social character of the market (money, prices) is irredeemably anti-socialist and must eventually be discarded or whether its social character can be transformed so that the market becomes a tool in the enhancement of socialist relations.

What makes the first approach, i.e. the movement towards a money-less and price-less economy theoretically unconvincing, at least up to now, has been its inability to answer the 'dispersed information' argument of Mises and Hayek in the Austrian neo-classical school. The fragmented and contextual character of much economically relevant information, whose knowledge can only be known to specific entrepreneurs or would-be entrepreneurs cannot but escape central planners and would not be acted upon by some process of collective democratic decision-making. Only the entrepreneur would, in most cases, be willing to 'back his hunches' and 'suffer' the (market) consequences. Only the market allows for such effective use of fragmentary information in a world of unavoidably dispersed information. All forms of planning, even the most democratic, involve aggregation of information/knowledge, a process in which there is unavoidably a 'loss'. These also involve, no matter how decentralised the planning process (which must also retain mechanisms of centralisation), a separation between the point of knowledge and the point of will or action, that is a comparative handicap.

The claim that 'truly democratic planning' via the institutionalised active consultation of given producers and consumers would be better than the market in co-ordinating information and sending appropriate signals, i.e. be a better allocative mechanism, simply does not give this problem of 'dispersed knowledge' its due weight. The 'simulated market model' showing the possibility of achieving general equilibrium without the presence of a capitalist market and the private property ownership system on which it rests is once again helpless against the force of this Austrian critique.

The market is to be preferred not because it is the best system of clearance of supply and demand in a world of multiple exchanges but because it copes with constant change, uncertainty and imperfect knowledge (which must characterise all economies) better (more efficiently and with greater encouragement to innovation) than any other mechanism. The innovative risk-taking capitalist entrepreneur rather than the efficiently allocating capitalist market lies at the heart of the superiority of the capitalist economic system [Scott Arnold 1990].

The challenge confronting Marxist economists is to establish a case for socialist self-management and public enterprise that based itself on the dispersed character of economic knowledge and refused the tempting delusion of totally planned outcomes.¹ [Blackburn 1991: 38] Can this be done without markets? Can such markets be divorced from their capitalist institutional underpinnings and can they be made to do such a job?

Only a thoroughly decentralised economy can hope to cope with the problem of dispersed knowledge adequately and can be compatible with genuine socialist democracy. More socialists than ever before, rightly or wrongly, believe that such a decentralised economy must not reject markets absolutely. They must not chase the chimera of a completely commodity-less economy. They may have to learn to live with the market even as they seek to substantially transform the institutional context (property relations, workplace relations) in which the market, money and prices operate.

To conclude, the first steps in fleshing out the case for a socialist economic system will have to be undertaken within the existing framework of capitalism. For some time to come the central strategic perspective will be the transition to the transition rather than the transition to socialism. That is to say, the reconstruction of a feasible and desirable vision of socialism and the creation of a growing mass commitment to its fulfilment will itself require partial successes in the reshaping of capitalism in an egalitarian, humanitarian, indeed in an anti-capitalist direction. All this is at some remove

from the more classical debates and preoccupations in the marxian socialist tradition some of which have featured in this paper. The urgency of those debates assumed the actuality of the revolution in more than just an epochal long term sense. But the changed strategic perspective is forced upon us by the asymmetry in the intensities between the "crisis of socialism" and the crisis of capitalism. That still leaves socialists, marxists and others with a very significant agenda of concrete tasks. It is more than enough to be getting along with

Notes

[An earlier draft of this article was presented at a Socialism Study Week organised at the Indian Institute of Advanced Studies, Shimla, in June 1993. I am grateful to all the participants present there for their comments on the earlier draft. Particular thanks to Javeed Alam.]

1 It is in the period of post-October rule that a Jacobinist notion of vanguardism was theorised in order to justify the Bolsheviks holding on to power in the name of a decimated working class and a peasant population increasingly hostile to Bolshevik rule. This notion of vanguardism is well summed up by a former Trotskyist Leninist turned opponent, T. Wohlforth. The interests of the working class are expressed through the thinking and practice of a section of that class organised into a vanguard formation—the ruling communist party. Indeed, how else could Bolshevism justify its rule in the face of growing opposition by peasants and growing sections of the working class as well?

Given the then existing alternatives one can agree that the Bolsheviks should have sought to hold on to power but without endorsing the rationalisations they provided to justify this. [See T. Wohlforth 1992]. In general, however, Wohlforth's assessments are unbalanced and often unfair to the tradition he is repudiating. For a more sober view recognising the Jacobinist lurchings of late Leninism (Leninism in power, especially in its last phase) but doing much to show how inadequate the Jacobinist thesis is when applied indiscriminately to Leninism, see N. Harding (1983).

2 No political current, not even the workers' opposition nor the Anarchists and Anarcho-syndicalists, developed a set of systematised ideas about the relationship between enterprise democracy and socialist planning. Though on almost every specific issue of workplace democracy, some current or the other put forward what we would in retrospect perhaps consider the better and democratic alternative to the centralising and anti-democratic perspectives of Lenin and Trotsky and the right Bolsheviks (right and centre here being a reference not to permanent biases on all major issues but only in respect to democratisation of work relations, i.e. transformation of relations in production).

The most consistent worker democrats were to be found in the factory committees often shifting their political allegiances or even

critical sometimes of all the parties. The argument that enterprise democracy (more power to factory committees) would have strongly negative effects on productivity due to their piecemeal and local outlook [F. H. Carr (1966) endorses this view used by Leninism in power to justify top-down control of workplaces and of the production process] has been criticised most strongly by S. A. Smith (1985) who, as most factory committees were acutely concerned about raising productivity, in fact their efforts to enhance work effort, motivation and autonomy is strongly conducive to this [see also C. Sirrianni 1982].

But though the Leninists were particularly bad on questions relating to workplace democracy, most worker committees did not have an adequately comprehensive vision of the importance of factory democracy to the economics and politics of the transition to socialism. Thus P. Fitz (1990) while fiercely critical of Leninism and Bolshevism, says the decisive drawback was that the Russian working class was itself divided (factory committees usually comprised the more skilled male workers) and lacked the unity, collective vision and determination to rule over themselves. Thus the number of factories where worker-led Soviets institutionalised themselves was greater than the number of factories actively seized. While factory committees resisted trade union attempts (abetted by the right and centre Bolsheviks) to dominate them, they themselves never put forward systematic perspectives to have the unions subordinated to the factory committees.

3 See A. Vanuk (1986). This article combines a review of N. Gerasimov's book (1986) with original analysis to show how distorted so many interpretations of the Leninist concept of the vanguard party have been. It was written as a direct rebuttal of the views promoted by a small but influential circle of Indian intellectuals/students who had become Trotskyist Leninists of a kind in the course of their development as anti-Stalinist Marxists only to subsequently become anti-Leninists and non-Trotskyist/Trotskyists. It is not in the least a coincidence that even in their Trotskyist Leninist phase they had no serious engagement, intellectual or political, with the most important political/organisational embodiment of Trotskyism, Leninism, the Fourth International. These anti-Leninists ascribed to Lenin and Leninism what can be called an injectionist thesis of the development of socialist consciousness which was seen as equivalent to theoretical knowledge where the doctor giving the theoretical injection is the party intellectual and the passive patient the non-party working class and the party masses. Even some highly sophisticated analysts producing works of very real merit have fallen prey to this erroneous thesis. A few of them have recognised that there is an ambiguity in 'What is to be done' in regard to the injectionist thesis but have left it at that while coming down on balance in favour of indictment on this count, i.e. passing the verdict of an elitist substitute for Leninism, see C. Sirrianni (1982) and J. Lenin (1989). Their verdict and indictment could not have

been logically sustained if they had investigated this ambiguity to see where the balance of plausibility in interpretation of the text actually rests. For fuller treatments of the falsity of the injectionist thesis indeed its decisive refutations see N Geras (1986) and N Harding (1983). Geras's exposition in particular is outstanding in its textual clarity and balance.

Regarding early (1917-18) contextual evidence of Leninist authoritarianism one is often provided by anti-Leninist socialists with the staples of liberal interpretation particularly in regard to the dissolution of the constituent assembly. Limitations of space here and the fact that this issue is very much at a tangent to the central concerns of this article prevent a fuller contextual historical criticism/rejection of these standard liberal claims voiced by anti-Leninist socialists as well. The fact that they are liberal claims does not in itself of course make them wrong.

- 4 Harding (1983) is categorical on this point insisting that Lenin actually tried to implement some of the key perspectives of State and Revolution in the first months after the October insurrection.

- 5 For a clarification of the political essence of Leninist vanguardism see A Vanak (1986). E H Carr has commented on the unique vibrancy and exceptional quality of political debate within the Bolshevik party in its heyday unmatched by any party anywhere before or since. To this day no bourgeois democratic party and no anti-Leninist socialist party (neither Eurocommunist nor Social Democratic nor Maoist/Stalinist parties claiming to be Leninist) have ever institutionalised tendency and faction rights within their respective parties.

Yet this is the best guarantee of party internal democracy: the best check on the formation of durable political elite able to manipulate other levels of party membership. Very briefly during the Prague Spring and Gorbachev's glasnost the issue of institutionalising tendency and faction rights surfaced only to subside as bourgeois democratic forms of party and non-party organisation became the new lodestar. The only parties anywhere in the world to institutionalise tendency and faction rights (something that Socialists who condemn Leninism in the name of wanting greater democracy should surely endorse) are self-consciously Leninist vanguard parties belonging to the Fourth International. The late R Miliband and I Panitch while rejecting the undemocratic character of Leninist/Trotskyist vanguard parties have always been markedly circumspect in criticising the supposedly undemocratic internal life of the Fourth International and its members. With good reason there are no examples of any other socialist parties which have a more democratic party constitution or a more democratic practice of internal political debate and decision-making.

Non-party formations or movement structures focused on a single issue or sector of oppression can of course have much looser and consensual forms of full participation in decision-making. I.e. claim to be more

democratic. It is in the inter-party comparisons that the best Leninist parties come out so well. Anti-Leninists should ponder if they are so inclined as to whether this is in spite of democratic centralism or because of it? Many anti-Leninists might also ponder over the fact that well after the principle of democratic centralism had been constitutionally enshrined Lenin suggested in 1906 the institutionalisation of a membership referendum on key political questions [see E Mandel 1992].

- 6 Polan sees the authoritarian Bolshevik party as a subordinate cause of the rise of an authoritarian state under Bolshevik rule. He is reluctant to attribute too much to the Leninist party because he recognises that non- or anti-Leninist parties socialist or bourgeois also suffer from the same basic failings sometimes even more so. Thus the Leninist party has no monopoly of the trait of excessive rigidity or of the trait of elite manipulation or of the trait of self-righteousness e.g. claiming scientific correctness for its ideological claims.
- 7 See R Blackburn (1992) and E Mandel (1992). The latter's view is particularly noteworthy as he is widely regarded as a champion of orthodox Leninism. All these forms of direct democracy and several others could be suggested are not substitutes but complements to universal suffrage institutions. After the traumatic shocks of fascist military and Stalinist dictatorships the working masses throughout the world are deeply committed to free democratic elections to parliament-type bodies. It would be suicidal for socialists to set themselves against that commitment in the name of some spurious dogma echoing the arguments of the Bolsheviks and the Comintern between 1917 and 1921 [Mandel 1992:201].
- 8 See N Scott Arnold (1990) for an unimpressive elucidation of the Hayek/Mises argument and on how Socialists and the socialist calculation debate never confronted the force of this particular criticism but only sidestepped it. In general Arnold's book is one of the most serious and sophisticated right-wing critiques of the very possibility of an alternative to capitalism i.e. Marxian socialism/communism. Anathema though his conclusions may be to most Marxists they will only be seriously considered and evaluated by giving his book the kind of serious interrogation that it deserves. His arguments cannot and should not be casually dismissed.
- 9 The answer to the first question is probably no. The answer to the second is probably yes [see J Roemer 1993]. The merit of Roemer's version of market socialism is that it makes no claim to being the only feasible (let alone desirable) socialism and no claims therefore to being the proper long-term goal of socialists. Roemer is much more concerned to flesh out the practical details of what might be the initial yet significant forms of structural transformation which are good in themselves and which can also convincingly open up vistas of developing alternatives to capitalist institutions/capitalism. He deals in a practical and impressive fashion with modelling what I have called the 'transition to the transition'.

Making Kerala Model More Intelligible

Comparisons with Sri Lankan Experience

Rex Casinader

Sri Lanka shares with Kerala the achievement of remarkably good social indicators in terms of literacy, life expectancy, fertility decline, low infant mortality rate, etc. And like Kerala this achievement is made the more remarkable because it was made in the context of slow economic growth.

While there are significant differences between the political economies of Kerala and Sri Lanka, a significant commonality is the presence of marxist/radical parties in mainstream politics. An unpacking of this commonality, with some critical variations inscribed within it, may contribute to making the Kerala model a little more intelligible. It may also provide some insights into the increasingly convoluted Sri Lankan development experience problematised by its ethnic pluralism.

ROBIN JEFFREY's review (*EPW*, March 5 1994) of Franke and Chasin (1992) presented an excellent overview of the arguments of the two authors to make the Kerala model intelligible. Jeffrey then makes an informed rejoinder that

Kerala's political activists grew out of a unique conjuncture of circumstances. Within such circumstances Jeffrey locates the importance of anomic/deracine savarna caste youths and avarna activists who confronted brahminic orthodoxy and orthopraxis. But Jeffrey's argument that Kerala's matrilineal past is also a crucial component is questionable. Jeffrey had made this argument in an earlier paper (1987) as well. That this argument may be flawed is suggested by the Sri Lankan experience.

Sri Lanka shares with Kerala the achievement of remarkably good social indicators in terms of literacy, life expectancy, fertility decline, low IMR, etc. And like Kerala this achievement is made more remarkable because it was made in the context of slow economic growth. In fact the Kerala model has also been referred to as the Kerala-Sri Lanka model [Timberg 1981]. In recent years Sri Lanka may be moving away from this model following the advent of a right-wing government since 1977 and their liberalisation policies and adoption of the World Bank/IMF structural adjustment programme, including some dismantling of the subsidies and social welfare package that had, among other objectives, sought to provide equitable access to health care and education. This may have been compounded by the ethnic strife and violence that has scaled up during the last decade. But it is a testimony to the human capital that the Kerala-Sri Lanka model creates that in spite of the difficult times that Sri Lanka is going through, her HDI remains remarkably high [Shiva Kumar 1991: 2345].

Unlike Kerala, Sri Lanka does not have a matrilineal past, so Jeffrey's assertion of the matrilineal past as being a critical ingredient of the Kerala model fails to

explain the Sri Lankan experience. In Sri Lanka the Sinhalese and a majority of the Tamils do not have a matrilineal past. There is a small Tamil Mukkuwa community on the Sri Lankan east coast with a matrilineal past. But ironically this community is among the few pockets that lag behind the high Sri Lankan national averages in the social indicators referred to earlier.

RADICAL PARTIES IN MAINSTREAM POLITICS AND GOVERNMENT

While there are significant differences between the political economies of Kerala and Sri Lanka, a significant commonality is the presence of Marxist/radical parties in mainstream politics, a commonality that points to the legitimacy of the Franke and Chasin analysis. An unpacking of this commonality with some critical variations inscribed within it may contribute to the discourse to make the Kerala model a little more intelligible. This unpacking may also provide some insights into the Sri Lankan development experience being in recent times increasingly convoluted and problematised by its ethnic pluralism.

Since the formation of Kerala state in 1957, governments have alternated between the CPM-led Left Democratic Front (LDF) and the Congress-led United Democratic Front (UDF). In Sri Lanka too, since its independence in 1948, governments have been alternately held by the right-wing UNP and a centre-left coalition led by the centrist SLFP. This alternating in parliamentary government and electoral process has been in the Sri Lankan case broken by the unusually long hold of electoral power (1977 to date) by the UNP. This period saw ethnic relations become more violent and intense and has been perceived to be a period of erosion of some of the democratic institutions and decline of the strong trade union movement. The emergence of strong organised labour, politicised and linked to Marxist/radical parties beginning in the 1920s/30s in Sri Lanka, parallels the Kerala experience of the symbiotic birth of trade unionism and radical

political parties during the same period. But there are critical differences too that are raised later in this note.

The Sri Lankan left parties that developed during the 1930s included the Trotskyite LSSP and the Communist Party of Sri Lanka, both partners in the centrist SLFP-led electoral alliances and coalition governments since 1956. This validates Franke and Chasin's argument that the Kerala model was driven by left-wing political parties and ideologies. It may be recognised here that even during periods of right-wing governments, the policy trends continued because such governments sought to pre-empt further radicalisation by continuing the social welfare package of health care, education, food and public transport subsidies. This is exemplified by the critical place of rice ration/subsidies in Sri Lankan electoral politics and manifestos until 1977. It further strengthens the argument that the critical factor for the Kerala-Sri Lanka model is the presence of radical political parties in mainstream politics and government.

EDUCATED YOUTH, UNEMPLOYMENT AND POLITICAL MOVEMENTS

A fall out of the Kerala-Sri Lanka model that is problematic is educated youth unemployment. The economies of both Kerala and Sri Lanka were unable to absorb the increasing number of young persons who became educated due to the increasing accessibility of higher education. This may have been compounded by the phase of the demographic transition in both regions, also brought about by the health care features of the model that saw an increasing youth component in the age structure of the population. This phase may be only now beginning to get over. Imbalances within the educational system between technical and non-technical education may have intensified the problem of matching employment opportunities with job seekers.

Among the explanations put forward for the ethnic conflict in Sri Lanka is youth unemployment and competition for jobs and

access to post secondary education. The latter is increasingly seen as a prerequisite for competitiveness in the job market. These explanations have been extended to explain the youth character of the I TTE, JVP and other similar groups. In the case of the JVP, the conflict engendered by economic competition is more of a class character though an ethnic element is not totally absent.

Given that youth are searching predominantly for white collar and professional jobs, the youth movements have also been characterised as petty bourgeois because their job and social mobility aspirations are petty bourgeois in character. There is an element of stigmatisation in such characterisation and it is seen as coming from an orthodox Marxist position (or as Gail Omvedt (1988) characterises it 'proletarian fundamentalism') that sees only the working class as the force capable of ushering in structural change. Those outside it including the unemployed and underemployed are seen as backward looking and politically reactionary and not the historical bearers of any social revolution. Their Marxism if any is seen as adventurist. The CP(M) activists in Kerala are perhaps seen as part of this phenomenon and the increasing youth involvement in CP(ML) activities is seen as supporting this analysis. There are however very significant differences between the CP(M) and the youth movements in Sri Lanka though some similarities may be seen between the IVP and the CP(M).

An issue of significance in a comparative examination of Kerala and Sri Lanka is the intense competition for employment particularly among educated youth and its potential implication for ethnic conflict. But for prospective Kerala entrants to the labour force the job market extends beyond its state boundaries. The net out migration from Kerala since the 1930s [Zachariah 1965/95] supports this observation. In contrast in Sri Lanka the job market is contained within the nation by the island character of the country. In the last decade there has been labour migration to the Middle East. Kerala too has made use of this labour market opportunity and the highest number of labour migrants from India to the Middle East are from Kerala. This is indicative in the Indian context of the relative willingness of Kerala job aspirants to be mobile. Obviously this capacity to be mobile includes the rest of India. This scope for a spatially extended job market perhaps helps to reduce competitiveness for jobs in Kerala.

LABOUR MARKET AND GENDER

An issue that needs to be researched is whether the labour market in Kerala is more segmented by gender than in Sri Lanka. If

this is so, then by relative greater exclusion on basis of gender the job market is rendered less competitive. But the data in the Table, which are relevant to this issue, does not suggest the likelihood of a markedly different gendered access to the labour market between Kerala and Sri Lanka.

The differing levels of the indicators on the status of women listed in the Table neatly reflect the differing scale of social development obtaining within India and compared with Sri Lanka. Some of them, such as age of marriage, female literacy and education have also been seen as contributing to other social development processes such as the fertility decline observed in Kerala and Sri Lanka. The common trends of Kerala and Sri Lanka are striking and validate their being classified as one type of development. The data does not suggest a significantly more gendered access to the labour market in Kerala than in Sri Lanka. However the slightly but consistently higher status indicators in Sri Lanka other than in literacy (column 6) are noteworthy.

Of particular interest for examining any gendered access to the job market is the female work participation rate and the percentage of females in non-agricultural activity. The higher rates prevailing in Sri Lanka suggest that the women have a slightly more open access to employment than in Kerala. More rigorous analysis is required breaking down work participation by occupation to identify what contribution-gendered occupations such as certain household industries, nursing, etc. make to the overall participation rate in both regions. This also needs to be done with data more recent than 1981 examining in addition the issue of the invisibility of some of the productive economic activities of women in census and other statistical data. This is not feasible in this note. The importance

of such examination is to identify whether the barriers to women's access to the job market differ between Kerala and Sri Lanka. Impressionistically it would appear that there are relatively fewer barriers for women to enter the job market in Sri Lanka than in Kerala.

The presence of a large female workforce in the Sri Lankan Free Trade Zone, the female labour migrants to the Middle East, female car park attendants, police women and female bus conductors in Sri Lanka are symbols of this, and stand in sharp contrast to Kerala. Among the labour migrants to the Middle East from Kerala females are negligible and confined to some health care professions. There is no free trade zone in Kerala. Female labour force participation in Kerala appears largely confined to gendered occupations such as nursing, teaching, clerical work and some traditional labour-intensive industries such as coir, cashew processing, textile weaving, etc. In Kerala bus passenger seating was until recently gendered and the recruitment of female bus conductors is a very distant or unlikely proposition.

What all this suggests is that there may be relatively greater constraints, some of them cultural, to female labour force participation in Kerala than in Sri Lanka, particularly in occupations that had been male preserves such as bus conductor and police. That educated young persons can perform. In Kerala then, there may be relatively greater gendered access to job opportunities that privileges males. If women's access to the job market is more limited than in Sri Lanka, then women are taking more of the brunt in job market competitiveness and are made to opt out as homemakers. If this is so, then the job market in Sri Lanka is apparently more intensely competitive than in Kerala.

TABLE: SOME INDICATORS OF STATUS OF WOMEN IN SRI LANKA AND SELECTED INDIAN STATES

	1	2	3	4	5	6	7	8
Sri Lanka	10.1	24.4	17.1	33	12.2	88	49.1	48.5
Kerala	14.1	21.8	12.8	32	9.4	90	48.5	47.9
Punjab	14.4	21.1	3.1	5	2.2	65	45.0	39.5
Bihar	63.9	16.5	9.2	18	2.4	34	29.7	21.3

Columns

1. Proportion of females married in age group 15-19
2. Singulate mean age of marriage for females
3. Female work participation rate
4. Female workers as a per cent of male workers
5. Percentage of females in non-agricultural activities
6. Female literates per 100 male literates
7. Females as per cent of total school enrolment Grade 1-5
8. Females as per cent of total school enrolment Grade 6-8

Note: All data are for 1981

Sources: (1) For Indian States - Vaidyanathan, 1989, Table, p. 6

because a relatively larger section of the population is not kept out of the job market on the basis of gender.

This is not to contradict what is implied by Jeffrey – women in Kerala occupy a better position relative to most other regions in India. Indeed one may argue that the broad north-south distinctions within India in gender relations and position of women improve on the southeast to southwest axis as well. Southwest-south Asia, meaning Kerala and Sri Lanka, may then be one of the regions where the position of women is *relatively* better in the context of south Asia. 'Relatively' has to be stressed, for there are a number of issues that clearly show that women are discriminated against or subordinated in Kerala and Sri Lanka on the basis of their gender. If we are to believe Vanessa Baird's journalistic narrative (1993: 13-14), feminist scholars such as Nata Durvy are sceptical of any gender equity or improvement having been achieved in Kerala. What is being discussed here is only the relative position and status of women. This is similar to the view that women in southeast Asia are said

...traditionally to have enjoyed a relatively 'high status' (enjoying economic opportunities, suffering few legal restrictions or damning stereotypes; participating in cultures where the sexes are construed in terms of complementarity and balance rather than differential worth). Likewise, constructions of 'womanhood' as a unitary and essential category are also undeveloped or are only now developing in response to such transnational processes as film, advertising, and tourism [Atkinson and Errington 1990: viii].

Errington goes on to cite Penny van Esterik who claims that "this alleged high status is accentuated by the contrasting male dominance characteristic of traditional Indian and Chinese societies" [Errington 1990: 1]. Leaving aside for the moment the difficulties of defining 'high status' cross-culturally and the validity of homogenising traditional Indian and Chinese societies, observers have been struck by "the complementarity of men's and women's work and the relative lack of ritual or economic differentiation between men and women there [southeast Asia]" (1990:1). It is not my intention to examine the specifics of these claims in this note, but it is significant that similarities in political history and organisation have been seen between southwest India and southeast Asia [Subrahmanyam 1986: 361]. Dale is more emphatic:

Certain aspects of the history and political organisation of Kerala are more intelligible when the area is thought of as one of the Hinduised states of southeast Asia rather than as an integral part of the south Asian subcontinent [Dale 1980:11].

Dale sees historical parallels between Kerala and southeast Asia in ecology, transport systems, cash crops, and commerce, and claims that Kerala shares most of the characteristics of the 'southeast Asian personality'. Franke and Chasin, while not drawing parallels to southeast Asia, argue that the Kerala model is influenced, apart from the political economy discussed earlier, by its unique ecology, maritime culture and role in Indian ocean maritime history. These latter features are shared by some of the southeast Asian states and Sri Lanka, particularly the southwestern quarter – the most densely populated region of Sri Lanka. Sri Lanka shares some of the political economy features of Kerala as well, but with some critical distinctions which are discussed below. These similarities further enhance the legitimacy of the Franke and Chasin analysis.

In this context it may be mentioned that Issac's (1986) use of a neologism in Malayalam, *gragara* ('gra' from 'gramani' [rural] and 'gara' from 'nagara' [urban]) to describe the mix of urban and rural landscape and economy in Kerala, has striking similarities to 'desakota' [McGee 1991] in the Javanese context. Desakota is almost an identical neologism coined in Bahasa Indonesia, with 'desa' (rural) and 'kota' (urban) to describe a similar socio-spatial landscape that exhibits an intense mix of urban and rural features.

Though there are dangers of historical geographical determinism in such comparisons and analyses, the acknowledged central role of the political economy of capital-labour conflict and radical ideology in Kerala-Sri Lanka reduces this danger. What is sought to be drawn out in this discussion is that part of the historical geographical/ecological contextualisation that may be shared by southeast Asia and southwest-south Asia may include the nature of gender relations and the status and position of women within them. It is perhaps this feature that Kerala shares, and not the specificity of its matrilineal past as claimed by Jeffrey, that influences Kerala's social history, including the Kerala model. This may make a little more intelligible the sharing of some of the social development features by Kerala and Sri Lanka.

COMPETITION FOR POST-SECONDARY EDUCATION

To return to the discussion on some comparative features of the Kerala and Sri Lankan development experience, the competitiveness in access to post-secondary education in Sri Lanka may also be more intense relative to Kerala. This is suggested because in some ways the Sri Lankan educational system up to the secondary level is more open and less elitist than the Kerala system at comparable levels. In the early

1960s all schools in Sri Lanka run by religious organisations that were financially aided by the state were nationalised. Shortly afterwards, all English medium schools were progressively converted to Sinhala and/or Tamil medium schools. There was just a handful private fee levying schools run by a few Christian organisations that were not state-aided and so not nationalised. But they too had to fall in line with government regulations on the medium of instruction. The Sri Lankan government had also since the late 1940s built a system of state central schools in both rural and urban areas that matched the privately managed schools in their facilities and quality of teaching staff, though sometimes perceived as unequal in social prestige relative to the older, privately managed schools. This obviously was the perception of the elites or elite aspirants.

In Kerala, too, there is a system of state schools, but the colonial school system as exemplified by state-aided (financial) but privately, predominantly Christian-managed schools continues to exist. Medium of instruction was not regulated by the state, and many of the privately managed schools continue to retain English as the medium of instruction. In addition, it appears the union government operates special English medium schools for the children of union government employees stationed in Kerala. For such employees and their families, drawn from all regions of India, English is, or is believed to be, the only common language. The English medium schools and the privately managed but state-aided schools were a colonial legacy that privileged the elites. Entry into this system meant ease of entry into post-secondary educational institutions that had English as the medium of instruction and eventually into a job market and professions in which the knowledge of English was an advantage, if not a prerequisite.

The Communist Party-led governments in Kerala did attempt educational reform that may have corrected some of the elitist features and brought the system closer to the educational system that has emerged in Sri Lanka. But the Christian Church was a major actor. The Congress Party's (the main electoral and parliamentary opponents of the LDF) stand on this issue, electoral politics and alliances in the political context, the nature of centre-state relationships, the Congress Party's position of the centre, and the constitutional and other powers of the centre, appear to have worked against these reforms being pushed through.

These differences, then, between the educational system that emerged in Sri Lanka by the 1960s and the Kerala system suggest that the Sri Lankan system was more open, equitable and less elitist. Such a system perhaps entailed greater competitiveness in the job market and at entry level to post-

NATIONAL COUNCIL OF APPLIED ECONOMIC RESEARCH
"Parisila Bhawan", 11-Indraprastha Estate, NEW DELHI - 110 002

IFCI Chair on Industrial Development at NCAER

Applications are invited from suitable candidates for a chair on research in Industrial Development instituted by the Industrial Finance Corporation of India (IFCI) at the National Council of Applied Economic Research, New Delhi. The designation of the incumbent shall be that of "Chief Economist".

- Age : 38 to 50 years
- Qualifications : Ph. D. in the relevant subject from a reputed Indian or Foreign University; research experience in Industrial Development either in a University, an independent research organisation, in a corporate enterprise or in Government. Candidates should have capacity for conducting independent research, ability to write clearly and succinctly and to lead a research team.
- Experience : 8-10 years of research in industrial development.
- Nature of Work : To guide research on his area in NCAER, and produce research papers in Industrial Development.
- Duration of the Chair : Initially for 2 years but could be extended.
- Emoluments : Rs. 12,300/= per month (Gross)

Other things remaining the same, candidates belonging to SC/ST and other backward and minority communities will be given a preference.

Candidates will have to appear for interview at New Delhi and will be reimbursed first-class train fare by the shortest route to and fro from the place where they are presently working.

Applications with full particulars of qualifications and experience together with copies of published papers/reports, should reach the **Registrar & Secretary at the above address by Friday the 22nd December 1995.**

TRAINING IN DISABILITY AND DEVELOPMENT

ADD India, a development agency working with disabled people, will be conducting a 6 week orientation course on "Disability and Development" from January 15th to February 26th 1996.

Applications are invited from those interested in learning about disability, development and related issues. No more than seven applicants will be chosen for this training programme.

- Venue : Bangalore, Field visits will be in Karnataka and Andhra Pradesh.
- Age & Qualification : Should be below 40 years, a graduate, fluent in English and in Kannada or Telugu and should have atleast 2 years development experience in working with the poor.
- Course Fee : Rs. 3,600 including simple food, lodging and travel.

Candidates sponsored by an NGO/agency and disabled people will be preferred. Concession can be given to deserving candidates. Please note that no employment is ensured at the end of this course.

Apply within seven days giving details about yourself and briefly state why you wish to join this course. Please write to:

ADD INDIA
571, 17th Cross, 5th Main,
Indiranagar 2nd Stage,
BANGALORE - 560 038.

secondary educational institutions. At this level, students in Kerala, particularly those who had been in English medium, had opportunities to seek admission to post-secondary institutions throughout India, and many of these institutions had English as the medium of instruction.

In Sri Lanka the admissions were obviously contained within the national system, and competition for admission was intense. Such competitiveness had implications for ethnic conflict given the plurality of the society. The use of the vernacular languages as mediums of instruction, though a progressive measure that removed some of the elitist features within the educational system, had to contend with the linguistic duality of the society. This may have had implications for ethnic conflict. The number of studies that focus on ethnicity and post-secondary education in Sri Lanka reflect the deep implications of the issue for ethnic conflict in Sri Lanka. The intense interest and competitiveness to gain access to post-secondary education is really a reflection of the intense competition for jobs, and also of a development process that made access to education more equitable. But it was also a development process with an economy that was unable to absorb the human capital that was created by the process.

This comparative discussion of Kerala and Sri Lanka aims at an understanding of the absence of ethnic or ethno-religious conflict in Kerala, and its presence in Sri Lanka. It suggests that while Kerala's social development has achieved social equity levels unmatched in the Indian context, less visible male and elitist privileges may continue to be retained. This, together with the spatial mobility for job search and post-secondary education extended to the whole of India, may have made the job search, competition for jobs and entry to post-secondary education relatively less intense than in Sri Lanka.

But there are also negative trade-offs in Kerala being part of a larger political entity of the Indian union. Some of the efforts to reduce these privileges were constrained by centre-state relations and the constitutional and other powers of the centre. Access to external economic co-operation and industrial development policy initiatives are also contained within the federal political structures.

Sri Lanka as an island nation state was free to proceed with a development process dictated by its own political economy. The big neighbour was not without implications as events of the last decade will suggest, but its island nation character permitted the logic of the social development process to proceed within the ambits of its own political economy. The openness of the Sri Lankan educational system through to the secondary level and then sharply constrained, relative

to its Kerala counterpart, is a case in point. The point here is that the openness of the system makes it more intensely competitive, and when this is locked in within an island nation of ethnic and religious plurality, it can be conflict-producing.

PLURAL SOCIETIES AND CONFLICT

It is important to note that Kerala is also a plural society in religious terms and in fact has, next to Punjab and Kashmir, the highest concentration of minorities (Muslims, 21.2 per cent and Christians, 20.6 per cent) in India. This pluralism is not without its frictional moments and implications for Kerala's political economy. Nonetheless, relative to plural Punjab, Kashmir and Sri Lanka, Kerala is a benign and tolerant civil society, a feature that distinguishes Kerala within the generic Kerala-Sri Lanka model. This discussion note seeks to explore this critical distinction by examining the differences in the multiple genealogies of radicalism in Kerala and Sri Lanka. It is, however, important to note that pluralism in Kerala and Punjab are only in religious terms; linguistically they are relatively homogeneous societies. Pluralism in Sri Lanka is both in religious and linguistic terms, and the dualism, bipolar or bicultural divide between the Sinhala Buddhist and Tamil Hindus has been seen as central to the politicisation and violence of ethnicity in Sri Lanka. The events of the last few years, however, indicate that the Muslims are no longer an audience and that dualism or biculturalism may no longer be a valid characterisation of Sri Lanka. The linguistic divide makes it difficult for dialogue (except for a few who are bilingual) or to hear the 'other' voice, let alone begin to develop a capacity to listen to the 'other' voice.

REFORM MOVEMENTS AND THE POLITICAL ECONOMY

A fact of historical and geographical significance for Sri Lanka's island nation character is the retention of Buddhism as the religion of the majority of its people. The colonial experience of both Sri Lanka and Kerala have many commonalities, but some of the responses to colonialism have been textured by the different religious contexts and the presence of two Hindu princely states, Travancore and Cochin, in Kerala. Some aspects of these responses appear relevant in the processes that have shaped the political economy of Kerala and Sri Lanka. In the colonial encounter, to morally legitimise colonialism, it was often perceived and presented by the colonisers as a 'civilising mission'. The indigenous response was varied, but among them were counter players. As Ashis Nandy characterises them in the Indian context, they

borrowed their fundamental values from the western world view and, in spite of their image as orthodox revivalists, were ruthlessly critical of the Hindus. They also took the position that the Hindus had been great in ancient times and had fallen on bad days because of their loss of contact with textual brahminism. [Nandy 1983:23]

In Kerala of the late 19th and early 20th century, a social-cum-religious reformer was the charismatic figure of Sri Narayana Guru (1854-1928). While he shared some features of the counter players, there were significant differences as well. He was not a privileged or 'savarna' caste elite seeking to reform from above. He was a member of a subaltern or 'avarna' caste, the ezhavas, and was challenging Hindu, or more precisely, brahminic orthodoxy from below. It was an anti-brahmin establishment movement from within the Hindu community, not led or orchestrated by Christian missionaries as in some other parts of south India.

The Sri Narayana movement sought the removal of overt discrimination against ezhavas on the basis of caste, such as the limited use of public roads, access to temples, entry to the state bureaucracy, etc. This was both by referral to Hindu texts as a legitimising authority for the inappropriateness of these discriminatory restrictions, as well as by social activism, such as satyagraha at temple entrances, caste association as a lobby and pressure group, etc. In the former, the charisma and learning of Narayana Guru was invoked. By his active participation in the reform movement, he gave a moral and textual authority to the challenging slogan of 'one caste, one god and one religion' to reform brahminic Hinduism.

The Sri Narayana movement became the most sweeping mass movement in Travancore in the late 19th and early 20th centuries. What is significant is that the Sri Narayana movement was not so much a reform movement engendered by the colonial encounter, as by the context of brahminic and caste domination in ideology and praxis. It may have been influenced by the missionary efforts at caste reform and the reforms from above, but basically it was a very successful attack on brahmin orthodoxy from within Hinduism, and it was from below, from the avarna/subaltern castes who were the victims of brahminic orthodoxy, ideology and praxis. This anti-Hindu establishment stance had a liberating influence on Kerala society of that time.

The ezhavas were occupationally concentrated in the coir industry where the trade union movement in Kerala was pioneered in the 1920s [Issac 1982, 1983a, 1983b, 1984, 1985]. There was through them a positive transference of the ethos of the social and moral legitimacy of social equity and protest from the temple floor to the

factory floor of the coir industry. The egalitarian ideology embedded in Sri Narayana Guru's teachings, and its implication for radical ideology and politics, is seen in the neat turning of the slogan of 'one caste, one god, one religion' to 'no caste, no god, no religion'. The Sri Narayana movement can be seen as part of the historically and ideologically rooted contestation between brahminism and sramanism [Thapar 1989:211-12], and in this contestation the historically most significant is Buddhism. But in Sri Lanka the absence of brahminism and the continuity of Buddhism makes this contestation a non-issue.

This leads us to briefly examine the nature of Buddhist revivalism in late 19th and early 20th century Sri Lanka. The reference here is specifically to the revivalism led by Anagarika Dharmapala. In contrast to the Sri Narayana movement, the Buddhist revivalist movement has to be contextualised in the colonial encounter. It was a response to the hegemonic position asserted by westernisation and a westernised elite in the colonial context. In this assertion of a hegemonic position there was an implied depreciation of the indigenous and the vernacular, and this included Buddhism. Anagarika Dharmapala's Buddhist revivalism was a response to this, and perhaps this was a reason why the revivalist language had elements of the language of ethnicity, a language that has been described as emotional and passionate, with affinities to concepts of resentment, shame, honour, pride, dignity, insult, inclusion or exclusion, humiliation or recognition [Cairns 1991:169, 174]. The important point to be stressed is that the contexts of the two movements, the Sri Narayana and the Anagarika Dharmapala, are very different, and the character, responses and language of the movements are also different.

Both movements had implications for the political economy of the regions. This Jeffrey identifies as the second of the two tributaries that meet to originate and define the radical political tradition in Kerala. In Sri Lanka among the participants in the Buddhist revivalist movement were the vernacular intelligentsia. They nurtured the movement and were at the same time nurtured by the movement. Part of this process was a growing anti-imperialist attitude, but they failed to find a political niche for their anti-imperialism, for the Ceylon National Congress was for them too elitist, comprador and inadequately militant and/or anti-imperialistic.

As a contextually thick paper by Michael Roberts (1970) suggests, the vernacular intelligentsia found the politically appropriate party with a militant anti-imperialist stand in the Lanka Sama Samaja Party (LSSP) that emerged in the 1930s.

Given the Trotskyite ideology of this party it could continue to espouse a militant anti-imperialist stand during second world war, unlike the Communist Party with its linkage to the Soviet Union and so a commitment to the war effort of the Allies that included imperial Britain. For their militant anti-imperial stand during the war, the LSSP leaders were imprisoned. This enhanced their mass appeal as anti-imperialists with the obvious parallels to Nehru, Gandhi and others in India.

The mass support that the LSSP enjoyed during the 1930s to early 1950s was partly, if not largely, due to the presence of the vernacular intelligentsia and their followers among the party cadres and supporters. It would even appear that the LSSP leadership

was not quite aware of the social and political character of this support for them, except perhaps Philip Gunawardene. In the 1950s with the birth of the centrist SLFP led by Bandaranaike, the vernacular intelligentsia found that this party was the more ideologically appropriate political party for affiliation and support. This among other factors of coalition politics contributed to the growing decline of the mass political character and importance of LSSP since the 1950s. It was the anti-imperialist stand of LSSP rather than its Marxian ideology that was attractive to the vernacular intelligentsia in the 1930s and 1940s.

What is the significance of all this for the Kerala-Sri Lanka development model? Radicalisation of politics and trade

Institute of Rural Management, Anand

INVITATION FOR COLLABORATIVE RESEARCH ON

Rediscovering Co-operation

IRMA is commissioning a year-long research programme leading to a national seminar on **Rediscovering Co-operation** in November 1996 at IRMA. This is a part of the Golden Jubilee Celebrations of the Kheda District Cooperative Milk Producers' Union (AMUL)

Academic scholars, leaders of co-operatives and practitioners are invited to write analytically rigorous conceptual/empirical papers on any of the following themes:

- Bases of Co-operation:** lessons from various disciplines – economics, ethics, sociology, psychology, law, history, systems theory, game theory, organisation theory, etc. – on the importance of co-operation and the conditions necessary for the emergence and success of co-operation;
 - Strategies for the Models of Tomorrow:** based on successful grass-root level experiments in specific sectors, formulating a proposal and a strategy for a large scale programme for promoting co-operatives; and
 - Co-operatives in the Emerging Context:** implications of the emerging trends in economic, social, political, technological, and other environments for the management of co-operatives.
- * Honorarium and limited financial support for research is available.
 - * Papers, accepted for the seminar after a rigorous review process, are to be brought out in an edited volume.
 - * Papers are to be submitted on or before July 31, 1996.

For further details contact at your earliest

unionisation, together with electoral and parliamentary politics have no doubt influenced the genesis and shaping of the model in both regions and so this is perhaps the common ancestry of the model. If we examine the radical politics, there is no doubt the centrality of the Marxian ideology, and even other external influences such as the Russian Revolution and the emergence of the Labour Party in Britain. But there is also the genealogy of the two reform movements, which are differing as I have attempted to show here. It is here that some more clues may be found for the absence or presence of ethnic conflict in Kerala and Sri Lanka.

We noted how the Sri Narayana movement had influenced the radicalisation of politics in Kerala and its contextuality in the continuing Indian historicity that Romila Thapar (1989) characterises as the brahmin-sraman contestation. It was located in a space and period of brahminic orthodoxy and domination, and it was a successful protest movement and assault from below and within Hinduism at these structures. This success, together with its moral and social legitimacy and principles of equity - some of them rooted and/or sanctioned by Sri Narayana Guru's teachings - were carried over to radical politics. This is the genealogy that is different from the Sri Lankan one. Seen within it or allied to it is the transformation of caste consciousness into class consciousness [Issac 1985]. It is this genealogy that informs in subtle ways the absence of ethnic conflict and significance of class conflict in Kerala.

In Sri Lanka among the multiple genealogies of radical politics, the one that may be traced to Anagarika Dharmapala is located in the colonial encounter, an encounter that was by definition made racial by white/European/Christian imperial intrusion. The revival movement that was a response may have been forced to develop a language of ethnicity. This one may argue, with its extension of 'other' to 'others', may make the presence of ethnic conflict a little more intelligible. It is perhaps these genes that also account for ethnicity being not totally absent from the JVP, whose origins are a rural youth radical movement, disenchanted, critical and impatient with the LSSP and CP which they perceived as being increasingly bogged down in coalition politics and parliamentary processes.

This note has sought to analytically locate Anagarika Dharmapala within the colonial encounter and not recover him from this past and place him in a discourse rooted in contemporary western liberal ideological perspectives. There is some violence in such representations. This discourse sometimes leads to demonising and stigmatising the Sinhala Buddhists and the Buddhist clergy with an accompanying

silence on Tamil nationalism that implies an exoneration of such nationalism from any contribution to the violence of the ethnic conflict in Sri Lanka [Tambiah 1986, 1992]. A counter player among the Tamil Hindus who paralleled Anagarika Dharmapala was Arumugam Navalar. Kailasapathy's (1984) writings suggest that his role and activism was also structured within the colonial encounter. Dagmar Hellmann Rasanavagan's (1989) criticism of Kailasapathy's position though a welcome debate is not convincing. There is a need for a comparative examination of Anagarika Dharmapala, Arumugam Navalar, Sri Narayana Guru and E. V. Ramaswamy, an examination that should seek to view the role of these reformers within a Gramscian analysis of traditional and organic intellectuals moving away from western liberal metanarratives.

SOME CONCLUDING OBSERVATIONS

To conclude this comparative examination of Sri Lanka and Kerala's political economy and the presence/absence of ethnic conflict, it may be pertinent to comment on some issues of cultural nationalism in Sri Lanka in the broader context of south Asia. It has been argued that in spite of the cultural-linguistic regional diversity within the Indian subcontinent in many ways paralleling the diversity in Europe, this did not lead to nation-state formation as in Europe [Embree 1985]. This it is contended was principally due to three factors: (1) an overarching brahminic ideology whose principal carriers were the privileged castes, further empowered by being the performers of the legitimising rituals for the rulers/kingship; (2) the intrusion of two powerful alien civilisations, the Islamic and the European, which worked against the fusion of regional cultures and political power, a process that seemed to underlie the rise of nation states and nationalities in Europe; (3) the dynastic powers in India were too peripheral to the regional cultures to facilitate a fusion of regional culture and political power.

It may be argued however that in the south Asian context this fusion had occurred among the Sinhalese, but when this occurred is not clear. Indeed the recent debate between Gunawardene (1990) and Dharmadasa (1992) is centred on locating the period when this occurred. In spite of the controversy that this debate has generated, both Gunawardene and Dharmadasa are in fact agreed that national consciousness or cultural/political power fusion had occurred; the disagreement is only on dating when this occurred. Kemper (1991) too addresses this issue and the appropriation and construction of a past to serve the present. But the dating of the 'present' remains unclear. There is no intention here to enter this debate on dating

the emergence of a Sinhala national consciousness or identity.

What is significant in the Sinhala culture is the minimal presence, if not absence, of brahminic ideology; the continuity of Buddhism provided an obstacle to brahminic ideology. Regarding the intrusion of alien civilisations, while the European intrusion was felt equally in Sri Lanka as in other regions of India, this was not the case with the Islamic intrusion. Indeed from the perspective of the Sinhala Buddhist culture it was the south Indian/Tamil presence that was the alien intrusion. The west at some time perceived as carrying the virtues of Hindu (brahminic ideology) intrusion or intrusion that could disintegrate the fusion of culture and political power that was occurring or had occurred among the Sinhalese.

This was further complicated in colonial Sri Lanka by the entry of Tamils, perceived to be homogenised with Hindu/Indians into what was culturally/territorially Sinhalese. These were the labour migrants from India to the plantations, internal migrants predominantly from Jaffna to take up positions in the colonial bureaucracy and professions, and the increasing presence of Tamils in the colonial urban economy of Colombo and other urban centres. The earlier processes of assimilating such migrants into the fused Sinhala cultural and political power were now constrained. The residential enclave characteristics of the new migrants was a factor, but more important, transport, communications and the printed word enabled the migrant communities to keep in touch with their original cultural regions. This acted against assimilation. Even Jaffna, which had its own cultural regional identity, was in the colonial and post-colonial political economy and time/space compression by transport/communications/printed word, increasingly made the periphery of two centres at the same time: culturally of Madras/Tamil Nadu and politically/economically of Colombo, a problem unique not without consequence for Tamil nationalism in Sri Lanka.

This presence of Tamils carrying the genes of brahminic ideology or perceived as such, and earlier practices of assimilation being no longer operational, may have generated a fear syndrome among the Sinhalese. This further crystallised the fusion of culture and political power among the Sinhalese, just as in India where secularism, socialism and brahminism marched under the strange ideological device of the charka which Gandhi had emblazoned on the banner of Congress nationalism [Embree 1989: 36]. In Sri Lanka, secularism, geographical electorates and parliamentary majorities were appropriate to reinforce the regional/Sinhalese fusion of culture and political power in the modern Sri Lankan nation-state. In the Indian context, Jinnah eventually

sought regional autonomy as a solution for the problem of minority rights. In Sri Lanka too, the Federal Party (and its descendants) sought such a solution dictated by the ethnic geographies of Sri Lanka. The territorial character of this solution for minority rights and protection enhanced the fear/resistance syndrome. For the territorial nature of the solution was seen by the Sinhalese body politic as a concrete manifestation of the disintegrating effect of an alien intrusion. The suggested solution also privileged minorities who were geographically concentrated meaning the Tamils in Jaffna and the Christian Tamils in the plantations and Muslim throughout island saw little benefit in regional autonomy as a solution for minority rights and protection.

This note is a comparative examination of the Sri Lanka and Kerala development experiences and their implications was aimed at making issues in both regions a little more intelligible. It raised the difficulty of accepting Jeffrey's assertion that Kerala's matrilineal past is an important element for Kerala's social development if success. This note also stresses the usefulness of comparative examination for understanding some of the issues in Sri Lanka. It underlines the need to move away from an isolated examination of the Sri Lanka in crisis. It particularly stresses the need to examine Sri Lanka's cultural nationalism and precipitating reform movements in comparison with the broader framework of south Indian cultural nationalism. They are all in some ways expressions of resistance to Brahminic ideological hegemony in south Asia particularly in its southern form. But at the same time they have significant and differing consequences. Sri Narayan (Guru) activism led to liberalising influences on caste and the transformation of caste consciousness to class consciousness. The Anjuman/Dharmapala movement led to the erosion of caste fissures among the Sinhalese but contributed to ethnic consciousness. Arumugam Navalar's work consolidated and perpetuated vellala dominance among the Jaffna Tamils. F.V. Ramaswamy's activities appear to have had implications for both Tamil nationalism and the political significance of non-Brahmin middle level castes in Tamil Nadu. A comparative study of the four reformers, their activism and its consequences may make the political/economic of these regions a little more intelligible.

Notes

- 1 It is also referred to as the Ezhava Social Reform Movement or SNDP after the Sri Narayana Dharmapala Prapadana Yogam (The Society for the Protection of Sri Narayana Doctrine or Teaching) (Issac and Tharakan 1986).
- 2 At the time of independence in 1948 the Ceylon National Congress transformed itself to the United National Party (UNP).

Naxalbari and After

Arup Kumar Sen

IN his discourse (September 16) Debal K Singha Roy has analysed the question of empowerment of rural women from the perspective of the peasant movements in West Bengal. Two radical peasant movements – the Tehhaga and the Naxalite movements – were given special attention. He has correctly argued that the revolutionary zeal of the Naxalbari movement was followed by reformist measures on the agrarian front in course of time. It should be mentioned here that though the Naxalbari movement started as a peasant uprising in Darjeeling district of West Bengal, it took on the character of a broad social movement in India very soon. The legacy of the movement in the minds of the peasants and in the academic/state discourse can be an interesting area of study.

More than two decades have passed since the brutal suppression of the Naxalite movement which spread its wings in the different states of India within a very short span of time in the late 1960s. Now it may sound anachronistic in the academic circle to talk about the movement since it could not fulfil its projected goals. But all revolutionary movements leave their marks in the social fabric in multiple forms. The Naxalite movement was no exception in this respect. To put it in the words of Samar Sen, "Naxalbari exploded many a myth and restored faith in the courage and character of the revolutionary left in India. Indeed the upheaval was such that nothing remained the same after Naxalbari. People had to readjust their position vis-à-vis every aspect of the system: political, administrative, military, cultural".

The Indian state was forced to reformulate its agrarian strategy in the wake of the movement. While assessing the land reforms in India, the noted social scientist P C Joshi observed: "the rise of Naxalism and the threat posed by it in the late 1960s was one of the main factors responsible for the sense of urgency with which the ruling elite revived the question of land reforms during the close of the 1960s and the beginning of the 1970s". But such reformist measures coupled with brutal state terror could not erase the heritage of the Naxalite movement from the minds of the Indian peasants. This is evident in the ongoing peasant movements in Bihar and Andhra Pradesh, which are being led by different Naxalite groups. Panchabati Nirmala, a female peasant activist in Andhra Pradesh, was brutally tortured and killed by the police

in 1969. But even now, she is revered as a folk heroine by the peasantry of the Uddanam area.

The Naxalite movement had a significant impact on the student community. A large number of students of different educational institutions in West Bengal participated in the movement. This posed a major challenge to the Indian state. Ranjit Gupta, the then police commissioner of Calcutta, took the schools and colleges to task for their failure to provide the necessary intellectual leadership to the students, and for the erosion of discipline.¹ The changes introduced in our education system to cope with the threat posed by the Naxalite movement can be an important area of research.

Writing history is a game of truth construction. The history of blood and terror associated with the suppression of the Naxalite movement did not create a good image for the Calcutta police. Anyone acquainted with the social situation in Calcutta in the late 1960s and early 1970s, knows the brutal methods adopted by the police in the streets and within the prisons to teach a lesson to the Naxalites. But in its history written on the occasion of the Calcutta Tercentenary, the Calcutta police tell a different story.

The extremist challenge posed by the Naxalite, which rocked the city in the late 1960s and early 1970s, was contained mostly by police action within the legal and administrative framework.

The picture given above represents an attempt on the part of the Calcutta police to create a benign image of itself at the discursive level. But Ranjit Gupta, who masterminded the strategy to crush Naxalite upsurge, informed us in the mid-1980s about the new measures introduced in the Calcutta police for containing the Naxalite terror. This insider's view negates the authenticity of the discourse created by the Calcutta police in the early 1990s. One important measure adopted by the Calcutta police to fight the Naxalites was to recruit lumpen proletarians of the Home Guards variety who acted as police informers. Another significant measure was to arm overnight for their self defence a 18,000 strong police force which was traditionally unarmed.² In defence of the strategy of recruiting lumpens in the police force, Ranjit Gupta noted:

This use of the lumpen proletariat (of the Home Guards variety) against the Naxalite lumpen proletariat has often been compared to similar use of the urban riff raff during

the 1848 revolution by the establishment (in Paris). But I did not copy history to set up intra socials under police control to fight the intra social. If the wrong side was the obvious thing to do, and it was done.³

The above account gives us a hint of the legal and administrative framework which the Calcutta police had in mind while silencing the Naxalite. It is to be expected that we can find many strategic and tactical mistakes on the part of the leadership of the Naxalite movement. But the brutality of its suppression will remain in our collective memory for many years to come.

American Scholars and South Asian Studies

Ajit Menon

DESPITE his stated intention of focusing primarily on the restrictions placed by the Indian government on American South Asian scholars (Paul Brass *IPW* September 9) goes far beyond this by characterising these restrictions as a form of victimisation. In doing so, he betrays a strong sense of paternalism and liberal sanctimony to which we would like to respond.

Brass's main contention is that South Asian Studies in the US has suffered because of excessive restrictions placed on American scholars. Restrictions which have put certain fields of study out of bounds, caused inordinate delays in research and dissuaded many would-be scholars of South Asian Studies from entering the field. His main argument is that this has occurred because the Indian government in the form of its bureaucratic elite has chosen American scholars as pawns in a chess game to settle a score of grievances it has with the US government ranging from relations with Pakistan to immigration policy. The problem with Brass's argument is not his complaint is such. After all, any Indian scholar, especially those from non-government institutions will tell you exactly what type of inconveniences, frustrations and unnecessary delays we often face in our research. Perhaps these bottlenecks, Brass would agree, are also created to dissuade us from doing research. Or is it that the Indian bureaucracy is punishing us for having had the opportunity to pursue research in a similar way as it is punishing Americans for the fact that they are Americans? Brass addresses these concerns only in footnote by saying that social scientists should stand together against all our governments against any restrictions whatsoever on free access of scholars and writers to research. Whether such international solidarity will be anything more than a token action is another question.

but in principle we agree that access to information should be easier to come by.

It is Brass's articulation of the problem however, which is disturbing. Is it really the bureaucratic elite's way of showing its anger with the US? Would it not have been enough if Brass just illustrated the bottlenecks involved in research in India? Obviously not because he had another agenda as well — i.e. to vent his frustrations that American scholars were somehow persecuted minorities. And it is in trying to illustrate this that he adopts an overly paternalistic tone. For example, he says, 'since every upper caste Hindu family in India, and not even every upper caste bureaucratic family in India, can succeed in sending their children to America,

an enormous resentment exists in the minds of many at their failure. Perhaps Brass's depiction of this as an upper caste phenomena allows him to get away with it. But not so what follows. According to Brass, 'it matters not to them (the bureaucratic elite) that their government's policies regarding the obtaining by foreigners of citizenship in India are among the most restrictive in the world and those of the US, with all its defects, one of the most open.' What Brass seems to be saying in a round about way is that somehow Indians should be grateful for the opportunities we have to go to the US and even become citizens. Perhaps Brass should examine US visa procedures and its defects more closely. In fact, the experience of getting a visa is so dehumanising that it is enough to put anyone of. Moreover, make no mistake that acceptance of Indian scholars (in terms of giving visas) is based largely on the benefits it provides to the US economy as opposed to anything else.

Thus if Brass is truly interested in only highlighting the problems of American scholars, why does he insist on bringing up issues of immigration, Indian scholars in the US and the likes and dislikes of US foreign policy? But now that he has let me not waste the opportunity. After all in one sense these issues are not mutually exclusive. Thus while Brass seems bitter about the relative ease by which Indians can study in the US assuming it is their children's birthright, he seems particularly frustrated by the fact that well intentioned American scholars are often not welcomed by the Indian government. Is that because he feels the Indian government should like its citizens, also be thankful? Moreover, surely the fact that many of the American South Asian scholars have supported the Indian polity should make little difference with regard to being given academic freedom.

If Indian scholars have kept quiet with regard to the hassles American scholars face, perhaps it is because they felt it is no different than that what Indians face. But throughout the article Brass compares the predicament of American scholars with the so-called excellent access Indians get to the US education which too is highly exaggerated at best as it only applies to a small minority who seek to go. Moreover, one could argue that foreign scholars in general because of their access to larger stipends (in rupee terms) are able to enjoy benefits that Indian scholars cannot. That coupled with the fact that the 'West is best' mentality prevails amongst many of our elites surely if anything privileges the foreign scholar.

The other point we mentioned earlier is that of liberal sanctimony. Brass seems overly concerned and angry about the fact that US scholars are often held accountable for the actions of their government as in the case of Vietnam. Why is Brass so troubled by this? Let us give an example which might make Brass rethink his position. During apartheid South Africa, the call from most of the international community was for economic sanctions — similar to calls for a boycott of the US during the Vietnam war which Brass is referring to. Within South Africa this call was supported by a large majority because it was realised that it was the most effective way to put pressure on the South African government to dismantle apartheid. Very few South Africans who supported this dismantling argued like Brass did that they should not be held responsible for their government's ills. Perhaps Brass can take a lesson out of the South African book. The important point here is that Brass is unwilling and unable to differentiate between resentment at his government and the possible resentment towards Americans (justified or not) as a result of it. And that is because he like most other American liberals is only willing to account for historical wrongs such as Vietnam if it does not make him feel guilty.

So how is this relevant to American South Asian scholarship? It is relevant to the extent that Brass is unable to come to terms with the fact that he as an American might have to endure certain ill feelings based on the actions of his government. And if those ill feelings have crept into the Indian bureaucracy as well (which is doubtful), he will have to deal with it like Indian scholars do. Moreover if that means as Brass himself sarcastically illustrates that Americans are seen as agents of imperialism whether we like it or not and must do everything in our power to make up for the actions of our government, then Americans might just have to do that as well. For similar reasons, we in India have to bear up to our responsibilities with regard to the evils of the caste system though we might not in a manner of speaking be directly party to it. Or does Brass feel we should not do that either?

Thus though Brass might have a genuine grievance with regard to doing research in India, by making it seem as if there is a conspiracy against US scholars, he shows us his true colours. Yes, access to information should be more freely available, but to all scholars who face bottlenecks and that surely includes many more than just the Americans. Somewhat ironically, by writing this article, Brass leaves this reader with the view that he (Brass) like many other western scholars sees South Asia through orientalist spectacles.

National Accounts Statistics of India - 3

Private Final Consumption Expenditure, Public Sector Transactions and Divergences in Estimates

FPW Research Foundation

THIS third set of statistics in this series presents the CSO estimates on (a) the distribution of private final consumption expenditure (PFCE) by major items of consumption and (b) key national accounts statements on the transactions of the public sector with the focus on depicting the sector's share in the respective economy wide aggregates. With the completion of the presentation of the series on micro aggregates in the earlier two issues and those on private and government final consumption expenditures in the present issue, it is now become possible to take a look at the integration of various accounts which the NAS presents in the form of consolidated accounts of the nation and which brings out the extent to which the accounts do not match as a result of divergent data sources and methodology of estimation. We do this in the final section of the present note.

I

Private Final Consumption Expenditure (PFCE)

Private final consumption expenditure (PFCE) is defined to cover current expenditures on goods and services by households including non profit institutions (NPIs) serving households. There are two dimensions to the concept of PFCE. PFCE in the domestic market and PFCE of resident households. PFCE in the domestic market covers current expenditures of resident households and direct purchases by non resident individuals and households (e.g. tourists and visitors) and extra territorial bodies (i.e. diplomatic staff and such other categories) in the domestic market. It does not include resident households' direct purchases abroad which is covered in PFCE of resident households. The product composition of private expenditures published by the CSO by type of objects is that of PFCE in the domestic market. It is only in the current 1980-81 series of NAS that the CSO has produced separate estimates of residents and non-residents' direct purchases abroad and in the domestic market, respectively which has made possible to make use of the appropriate concept of PFCE of resident households at least at the aggregate level in the consolidated accounts of the nation since 1980-81. (For their exclusion in the earlier series, see CSO 1980-79. see also CSO

1989-1985.)

The final consumption expenditure of household is conceptually made up of outlays on new durable and non durable goods and services minus net sales of second hand goods, scrap and wastes (SNA 1968). The household consumption expenditure includes the imputed gross rent of owner occupied dwellings, consumption of own account production (say foodgrains production for self consumption) valued at producer or farm prices and payments in kind of wages and salaries valued at cost that is the estimated actual cost provision for food, shelter and clothing to farm labourers and other workers. The rest of the PFCE is at market prices. Incidentally, for want of data the CSO does not cover net sales of second hand goods.

In the estimates prepared for PFCE, the expenditure of NPIs serving households is incorporated by implication and not by independent estimation. The convention adopted is that NPIs should be included under the government if more than half of their current expenditures are financed on account of grants by government. Due to privacy, only the CSO includes all NPIs in the household sector irrespective of their sources or extent of public funding (see Bhattacharya and Rameshwar 1990).

Methodology of Estimation

The commodity flow method used in estimation requires working out of commodity balances relating to various items of consumption. The quantity of final consumption obtained from commodity balances is generally evaluated at market prices except for the own account production mentioned above. The marketed part of food items is evaluated at average retail prices of rural and urban areas. For manufacturing items, the value of output is adjusted for excise duty and trade and transport margins.

Possible Sources of Errors in PFCE Estimation

Admittedly the basic data on total supplies and prices are mostly the same as those utilised for the preparation of GDP by sectors and as such the shortcomings in the GDP estimates would be inherent in the PFCE data as well. While most of the crops are covered by crop cutting experiments, some of the crops like small millets, other kharif

and trib pulses, some of the fruits and onion are covered only to the extent of 50 per cent of area. Cattle production is estimated by the residual method for sugarcane and some historical investment ratio. The inter-censal estimate of live stock population based on increment in stock etc. cannot take account of loss of animals during drought years when production capacity of the animals gets denuded. In the case of inland fishery, benchmark data are projected to other years on the basis of the change in population. Even in registered manufacturing, the data on responding factories are missing for the non responding ones in the year (the latter's past employment figure of year 1992). Above all the data base for estimating GDP and consumption goods and services originating in non farm informal sectors is said to be extremely weak. The latter derived indirectly by using some historical figure of value added per worker, the estimated size of workforce and suitable current indicators and price deflator. In unregistered manufacturing and trade, the problem has been compounded by non acceptability for the CSO of even the National Sample Survey (NSS) results from the 3rd and 24th survey rounds on directory and non directory establishment for the year 1978-79 and 1979-80 respectively. Because of the inconsistencies in their results (see CSO 1989-91 and 120). The CSO continues to use the data thrown up by the 29th round survey results of 1974-75. (For a detailed discussion of the data base on the unorganised sectors see the extensive debate in the *Journal of Income and Wealth* January 1993). Even the estimates of work force by activities seem weak for the inter-censal years (Subba Rao 1993).

While all of these affect the estimation of PFCE as much as the GDP, there are also possibly significant sources of errors in the commodity flow method applied to the PFCE itself. Data on wastage shed in DMH reports relate to a distant past and that too for a few commodities. The allocation of partly capital goods between final consumption and capital formation continues to be based on 1981-82 AIDIS, so also the proportion assigned to PFCE from services in the informal sector; 80 per cent of gross passenger earnings of the railways, 5 per cent of air transport, 75 per cent of organised shipping, 50 per cent

of taxi fare 90 per cent of auto rickshaw and bus fares, and 40 per cent of the postal earnings. In business services, the ratio is 10 per cent and for legal services 75 per cent. All of these involve a sizeable proportion of PFCE for which there is no direct current data (Tiwarei 1992).

In deriving the constant price series for the services sector which has implication for GDP as well as PFCE, the CSO makes extensive use of commodity price indices and questions have been raised in literature about the possible mix up between commodity price determination and factor price determination (Bhatia 1993). There is yet another source of inconsistency in the PFCE estimation by current and constant prices. In the case of cereals and pulses, for instance, current price estimates are based on farm prices for the quantity retained for self consumption and retail prices for the net market supplies, which roughly corresponds to estimates at market prices. In manufacturing this is achieved by adding import and excise duties and distributive

margins to the ex-factory prices. On the other hand, all items in the manufacturing group and food and non-food items where production is in terms of value, the current price estimates are deflated by corresponding wholesale price indices which are sure to leave behind some discrepancy between the two sets of estimates.

CSO's PFCE Compared with NSS Data

A more serious problem with the CSO's PFCE estimation has been revealed in the literature on poverty estimation. Finding that the estimates of total consumption expenditure based on the NSS data were found to be lower as compared to the CSO's PFCE by about 5 to 12 per cent in the 1970s and by more than 21 per cent in 1983-84 and 27 per cent in 1987-88, the Planning Commission has been making upward adjustment on *a priori* basis to the observed size distribution of consumption expenditure by the NSS and thus reducing the incidence of poverty in the country. This has been questioned in a series of studies on the cross

validation of NSS and CSO estimates of consumer expenditure commodity by commodity, by Minhas and Kansal (1989). They argue that even when adjustment is warranted, a case could be made for item-group specific adjustment rather than the *pro rata* which would also, to an extent, take care of the differing consumption patterns by different size groups [Kansal 1992]. Divatia (1990) however, questioned the above hypothesis that the NSS results are necessarily superior, and Katyal (1990) explaining the CSO's efforts to make use of as much of current data as possible, objected to the Minhas-Kansal method of working out margins of uncertainty in the three separate revisions of CSO data as they are not comparable.

Brief Results

In the present statistical series, Tables 10 (A) and 10 (B) present data on PFCE by objects. The first revelation is that as per the natural Engel's law of consumer expenditure the proportion of PFCE used for food items

1992-93	154451	151178	12578	9305	12763	141688	68370	72265	1053	141688

has declined, for the Indian population as a whole, from the early 1960s to 1990s. However, while the decline has been distinct and sizeable during the three decades from about 58 to 59 per cent to 48 to 49 per cent in the case of PFCE at 1980-81 prices, it has been indistinct and small from about 53 per cent to 49 to 50 per cent in PFCE at current prices. This proportion for food items in current price series has generally remained higher than that in constant price series, implying that inflation has affected the food consumption basket more than the consumption baskets of other items such as clothing, fuel and power, consumer durables and services. Prices of consumer durables seem to enjoy a distinct advantage in terms of lower increases over the period. Combined with the relative sufferance of food prices has been the relatively higher rates of increases in the deflators for gross domestic capital formation (Table 6B earlier). These are suggestive of the fact that the middle and upper middle class consumption has been favoured at the cost of the consumptions of the lower classes as well as domestic investment.

A second revelation relates to the unduly low level of 1.8 to 2.0 per cent of PFCE in the form of durable goods. This is because in the CSO estimation procedure, fairly high proportions of consumer durables (or the same as partly capital goods), ranging from 36 per cent in cars to 59 to 74 per cent in motorcycles, refrigerators, sewing machines and electrical goods (see Table 21.1 of CSO 1989:248), have been apportioned to capital formation and only the rest for final consumption. A third revelation is that the services sector, which contributes about 42 per cent of GDP, possesses a share of about 22 per cent in PFCE. Interestingly, between 1980-81 and 1993-94, while the GDP share of the services sector has risen by 5.5 percentage points from 36 per cent to 41.5 per cent, the PFCE share of the sector has galloped by 8.4 percentage points from 13.4 per cent to 21.8 per cent. A final revelation relates to the rather rapid growth in the 1990s of direct purchases by resident households abroad – from about 7 per cent of non-resident purchases in the domestic market in 1980-81 to 33.7 per cent in 1991-92.

II

Public Sector Transactions

Public sector comprises (i) government administrative departments, (ii) departmental enterprises like the railways, posts and telegraphs and other communication enterprises, and other departmentally-run enterprises, and (iii) non-departmental enterprises consisting of (a) financial and (b) non-financial, which are wholly or mainly government-owned companies and public corporations. Administrative departments including defence services are said to constitute the general government

comprising central and state governments, union territories, and all layers of local bodies and panchayati raj institutions. The currency issue function of the RBI is said to be a sovereign function and hence its Issue Department is treated as part of the general government, with the other Banking Department forming part of non-departmental financial enterprises.

Though the UN SNA has recommended that rent paid should be treated as factor payment, and so should be the imputed rent on government-owned buildings, the CSO does not cover them for want of data.

For various transactions of the producers of government services, the budget documents of central and state governments as well as those of a few local bodies form a major source of data. But the budget documents of many local authorities in urban, and more so, in rural areas, are not available. In the case of non-departmental enterprises, the coverage is more or less complete for the central government enterprises based as it is on their annual accounts. Time-lag in the finalisation of accounts of some of the enterprises appears a constraint even at the central level but it is said to be endemic at the states level.

Data Problems

Apart from the time-lag and non-availability of accounts of local authorities and departmental enterprises, the CSO has found that economic classification of state budgets is hampered because expenditures shown in the detailed demands do not match with those shown in the Annual Financial Statements, inter-account transfers cannot be reconciled, and details of 'plan schemes' are not available. As a result the CSO has to use other corroborative sources to undertake the economic classification (CSO 1989:313). Secondly, the estimates of net value added at 1980-81 prices are worked out by deflating the current amounts of wages and salaries by the CPI for industrial workers which is the basis for the granting of DA for government employees, but the full neutralisation is applicable to only employees

drawing pay up to Rs 3,500 per month. It is said that by this process the annual increment also gets deflated (Bhatia 1993). Thirdly, a major source of error relates to the classification of some of the expenditures into current consumption and capital formation and its effect on public sector saving (RBI 1982). Fourthly, the UN SNA has stipulated that the central bank of a country should be shown separately as a financial undertaking, whereas the CSO bifurcates the RBI as stated earlier (on this debate see RBI 1982 and Ghosh 1995). Finally, there is the question relating to whether consumption of fixed capital has to be provided for buildings and other structures maintained by public administration and defence as has been done by the CSO since the 1980-81 series [see Roy Choudhury (1988) who objects to it and Gothoskar (1988) who supported it]. Choudhury argues that repairs and maintenance in these cases was large enough to maintain such capital assets intact; any large maintenance expenditures on buildings, etc. incurred by administrative departments were to be treated as gross capital formation.

Trends in public Sector Share

The generally rising trend in the share of the public sector in total GDP or general loss of saving momentum in the public sector have already been dealt with along with macro-aggregates earlier. GDP originating in public sector was 20.8 per cent in 1981-82 and 28.6 per cent in 1993-94 but public sector saving was 4.5 per cent and 0.2 per cent, respectively. Amongst the tables presented here, certain interesting results stand out. First, slow but gradual rising trend in compensation of employees and total consumption expenditures of the general government as percentages of GDP, observed until the second half of the 1980s, has been halted and the ratios have remained static since the beginning of the 1990s. Interestingly, within these final expenditure categories, the share of the central government in wages and salaries or in total consumption expenditure, which steadily

TABLE B: CONSOLIDATED ACCOUNTS OF THE NATION AT CURRENT PRICES
VARIOUS DISCREPANCIES IN ACCOUNTS

Year	GDP minus Expenditure on GDP (Account 1)	National Disposable Income minus National Income Appropriation (Account 3)	Finances for Capital Formation minus Gross Capital Formation by Institutions (Account 5)	Capital Formation by Type of Institutions minus Capital Formation by Industry of Use
1980-81	915(0.7)	-1383(-1.0)	2427(1.8)	2659(2.0)
1981-82	-1703(-1.1)	478(0.3)	-3743(-2.3)	-760(-0.5)
1988-89	75(0.0)	5102(1.3)	525(0.1)	7849(2.0)
1989-90	9188(2.0)	10473(2.3)	3458(0.8)	13097(2.9)
1990-91	14039(2.6)	12740(2.4)	7598(1.4)	16854(3.1)
1991-92	24196(3.9)	22341(3.6)	4549(0.7)	14231(2.3)
1992-93	46757(6.7)	60476(8.6)	-9305(-1.3)	16977(2.4)
1993-94	-6911(-0.9)	15766(2.0)

Note: Figures in brackets are percentages to GDP at current market prices.

declined until the middle of the 1980s and which suddenly rose thereafter in the second half of that decade when defence expenditures registered a quantum jump, has experienced a significant downward trend since 1988-89 or thereabout. Secondly, the share of the public sector in nationwide gross capital formation which touched the peak in 1983-84 at 52 to 53 per cent, has been steadily declining since then; the decline has been rather sharp since 1990-91. It is now ruling at around 41 to 42 per cent. A large proportion of the decline has been in change of stocks and amongst institutions in non-departmental enterprises.

Finally, the public sector share of GDP originating in registered manufacturing has generally been on the uptrend and so has been the public sector share in the aggregate investment in the registered manufacturing sector in the most recent period. On the other hand, the public sector investment in real terms has eroded in major sectors and this has been particularly so in agriculture and other primary sectors.

III

Divergences in Estimates Based on Different Methods

Consolidated accounts of the Nation

As referred to in Part I, the consolidated accounts of the nation presented in the NAS attempt to summarise the transactions which take place in the economy in the form of production, household and government consumption, expenditures, income and outlay, capital formation and capital finance and to round up or close the system by the account on the external transactions of the nation. The Indian NAS presents partial aspect of the capital finance account (SNA Account 5) in that it presents only the details of gross accumulation and financing of the same and does not incorporate the transactions of financial assets and liabilities. However, the RBI's flow of funds accounts do provide annual data in this respect in a comprehensive manner, the latest being for the year 1992-93 (RBI 1995 and also RBI 1988).

However, because of the independent nature of estimates for different macro aggregates based on separate methods and separate sources of data, it is found that the accounts do not balance. As it is difficult to pinpoint the specific sources of the discrepancies, no attempt is made by the CSO to adjust any of the estimates to achieve balance in different accounts; the differences are retained as discrepancies or errors and omissions. There are three types of discrepancies in three main accounts of SNA (Table A) and there is a subsidiary discrepancy in estimates of capital formation undertaken separately by type of institutions and type of economic activity. There is yet another discrepancy in the external transactions account which, however, is

shown as adjustment of merchandise exports and imports; this is the difference between the figures of merchandise exports and imports from the two sources, namely the RBI and the DGC&S.

As shown in Table B, the only thing that can be said about these discrepancies is that they have grown over the years in absolute sizes and more significantly even in terms of the proportion to GDP. In the first consolidation (SNA Account 1) estimate of GDP on one side and expenditure on GDP on the other (GCF + PCF + GCF - exports minus imports) differ. It is found that the estimate of GDP based essentially on production method and partly on income method which is treated as a controlling total, generally tends to exceed total expenditures on government and private consumption and capital formation derived through the expenditure method (see also column 2 in Table B). Such excess was about 0.7 per cent of the estimated GDP at current market prices in 1980-81 but 2.0 per cent in 1989-90 and 6.7 per cent in 1992-93. What this implies is that if we derive gross capital formation (GCF) estimate as the difference between GDP on the one hand and government and household consumptions combined with net imports on the other (GCF = GDP - PCF - GCF - X + M) as suggested by Rakshit (1983), the GCF so derived would be higher by as much as 6.7 per cent of GDP, that is a total GCF of 30 per cent of GDP instead of 23.3 per cent as reported by the CSO for 1992-93. For 1993-94 it works out roughly to 28.6 per cent against 21.3 per cent as officially estimated. (To an extent of course, the discrepancies for the more recent period will be corrected as more information becomes available each year when the past data get revised).

In the second consolidation statement (SNA Account 3) relating to national disposable income and its appropriation, the total of final consumption and net saving exceeds net domestic product (NDP) combined with factor income from abroad plus current transfers from abroad generally by a larger amount than the first discrepancy, 2.3 per cent of GDP in 1989-90 and 8.6 per cent in 1992-93 (column 2 in Table B). In the estimation procedure, net savings include household saving in financial assets as well as public sector and corporate sector savings whose estimates are independent of the components appearing in the first consolidation.

In the third consolidation which concerns capital finance account (Account 5) the financial sources for gross accumulation (domestic saving and capital inflow from abroad) which are considered as the controlling total, generally exceed the total of independently derived GCF. However, there have been many years when the discrepancy has been the other way about (column 4 in Table B). Though as a proportion of GDP, the discrepancy has not been large but as proportion of gross domes-

tic capital formation, it has been large in recent years: 3.1 per cent in 1989-90 and (-)5.7 per cent in 1992-93.

The discrepancy in total GDP and expenditures on GDP (Account 1) is disaggregated into the levels contributed by the measures of current disposition of national income (Account 3) and capital expenditure (Account 5). Therefore, discrepancy in Account 1 is the sum of statistical discrepancy in Account 3 and errors and omissions in Account 5 (with net adjustments made for export-import data referred to above).

Asha Deep is back

Presenting, Asha Deep (II) Policy.

When it comes to *health*,
love and care of dear ones is vital.
What you also need
is
financial support.

Responding to customers' need for health insurance

Asha Deep II - the health insurance policy

BENEFITS

Provided the policy is kept in force for the full Sum Assured

- (a) If unfortunately the policyholder contracts Cancer (malignant) Coronary Artery disease involving bypass surgery Paralysis or Renal failure of both kidneys*
- Immediate payment of 50% of the Sum Assured
 - Waive of subsequent premiums
 - Payment of 10% of the Sum Assured every year
 - Payment of balance 50% of the Sum Assured and Vested Bonuses (on full Sum Assured) on maturity or death whichever is earlier
- (b) If fortunately the policyholder does not contract any of the specified diseases payment of full Sum Assured along with Vested Bonuses on maturity or death whichever is earlier

FEATURES

- Age at Entry 18 to 51 years (Maximum Age at Maturity - 65 years)
- Term of the Policy 10, 20 & 25 years
- Sum Assured Minimum - Rs 50,000/
Maximum - Rs 3,00,000/
- If the policyholder contracts any of the specified ailments within one year from the date of issue of First Premium Receipt additional benefits mentioned in (a) above will not be payable
- Policyholder to furnish satisfactory medical evidence to establish affliction by specified disease(s)
- ✦ For details of the ailments covered and other information about the Plan please get in touch with your Agent or nearest LIC Branch Office

AGRICULTURE MAN ECOLOGY

AME is a programme supported by the Government of the Netherlands, and implemented by ETC, an international not-for-profit consultancy group. **AME** is centred in Bangalore with a focus on rainfed areas of the Deccan plateau. **AME** aims to analyse, develop and promote sustainable agriculture and ecological farming in relation to land use and livelihood choices. **AME** supports and guides local networks of farmers, community organisations, GOs and NGOs with the assistance of researchers and technical specialists.

In its tenth year of existence, **AME** now moves into a new five year phase with a special emphasis on:

- identification, development and consolidation of relevant dryland technologies;
- development and application of participative and gender sensitive methodologies;
- training in technical and socio-economic aspects of sustainable agriculture;
- reference and dissemination services;
- networking with organisations and individuals active in sustainable agriculture and rural development.

AME intends to recruit a dynamic team committed to develop a shared understanding of agricultural and rural development issues. A learning organisation with openness to new ideas is aimed at. **AME** invites applications for the following positions:

- **Training Coordinator:** Experience in the creative design of technical and social training inputs in rural development.
- **Reference and Dissemination Coordinator:** Capacity for organising retrieval and consolidation of information, flair for writing, familiarity with development issues.
- **Team Member - Technical :** Experience in land and water use management, agricultural and rural livelihood systems analysis, training or exposure to ecological farming approaches.
- **Team Member - Social :** Experience in developing and applying participative tools of social and gender enquiry to rural contexts.
- **Area team Members:** 2 persons each in Karnataka, Tamil Nadu and Andhra Pradesh with experience in agriculture, training, community organisation and capability to liaise with, and guide a variety of institutions in rural development.

Qualifications required for all positions:

- Appropriate educational qualifications , at the Masters or Ph.D. level, with at least five years experience in rural development work, preferably in dryland agriculture and natural resource management.
- Affinity for alternative and ecologically sustainable approaches to agriculture and land use.
- Working knowledge of participatory methodologies.
- Excellent oral and written skills in English and knowledge of one South Indian language.

AME is an equal opportunity employer. Salaries will be commensurate with experience, qualifications and attitudes. All appointments will be on contracts. Deputations may be considered. Those interested in offering consultant support may also write in

Apply within 10 days, specifying the position, to **AME's** consulting firm at the address below with a CV that details your education, work experience, and current remuneration:

Vol XXX No 49

Assessing Structural Adjustment

Given that the country is now in the fifth year of the structural adjustment programme, it is time to take stock of at least the major trends in the economy. An examination of trends in broad macro aggregates, however, indicates that exports, imports and the balance of trade are following a long-term trend which has been unaffected by the two doses of devaluation in 1991. The balance of payments deficits thus appear to be unsustainable as they are accompanied neither by improved net export earnings nor by easier external finance. There is also some indication of stagnation in industrial production and acceleration of inflation since 1991

3151

Understanding Migration

Studies of migration have tended to separate two sets of issues: one which concentrates on wages, work and the material conditions of migration; the other which looks at the social and political consequences of assimilation between different cultural forms. Bringing these two concerns together enables a view of work as a process through which affinities are established. Work as cultural practice itself enables the process of integration and different work patterns will implicate degrees of incorporation. It is imperative, therefore, to analyse work rhythms if we want to understand the processes of migration.

3156

Enron: Hollow Claims

Those engaged in the renegotiation of the Enron power project have been claiming three 'achievements': (a) shift to a new fuel (naphtha), (b) equity participation for MSEB and (c) reduction of project cost and electricity tariff. A closer examination of each of these claims serves to dispel the euphoria that has been sought to be generated.

3127

Forests and the Poor

Sustained community participation in joint forest management projects is possible only when the survival needs of the poor have been met beforehand.

3130

Population and Environment

While the nature of environmental problems depends on the level of economic development, the character of industrialisation, the degree of urbanisation and the effectiveness of public policies, the central role of a rapid lowering of the rate of population growth in securing environmental improvement is indisputable.

3163

Efficiency of Input Use

What is the picture of trends in the efficiency of input use in the economy that emerges from the changing relationships between output, input and value added in the major sectors? Special Statistics.

3170

Linked Markets

The last two months' developments in the foreign exchange and money markets have thrown into sharp relief the close linkages developing between the two markets.

3120

Unlearnt Lessons

On election-eve the leaders of the Muslim Personal Law Board are again indulging in fanning communal passions and aiding communal politics in the country.

3129

'Invisible' Workers

While home-based workers are the most 'invisible' of all unorganised sector workers as they work in the privacy of their own homes, their very invisibility has in some ways contributed to the internationalising of issues concerning them.

3133

ANC Wins, but ...

The municipal elections in South Africa have confirmed that the ANC retains mass support, but the newly-elected town and rural councils face serious hurdles in fulfilling popular aspirations.

3137

Nationality Question

EVERY glance at any morning newspaper will establish that whether internationally or nationally the nationality question continues to be one of the burning issues of our times. The massacres in Rwanda and Bosnia, the invasion of Chechnya, the atrocities on the Kurds, the civil war in Sri Lanka, Palestine, Kashmir, north-eastern India and so many others show that a democratic solution to the nationality question is yet to be achieved, whether in India or in other parts of the world.

This is not surprising. The era of imperialism has aborted the growth of many a nationality. A few nations, which for historical reasons had an advanced development early in history, are suppressing many relatively less developed nationalities, economically, politically and culturally.

But this is an era of the liberation of nations also. Anti-imperialist national liberation struggles in the third world continue their heroic battle against their oppressors — be it the imperialist countries or chauvinist nations or the comprador rulers of a country. The Irish, Kurds, Palestinians and Tamilians in Sri Lanka are among those well known for their decades long glorious fight for self-determination. The Latin American, African and Asian nationalities are also on the warpath against imperialism for their liberation.

In India, the nationality struggles of the Kashmiris, Punjabis, Nagas, Assamese, Bodos and other north-east nationalities have been going on for many years and even decades now. Many other nationalities like the Jharkhandis, Gorkhas, Uttarakhandis etc. are fighting against oppression. Instead of attempting to solve the genuine problems of these nationalities, the Indian rulers have resorted to inhuman and brutal suppression of their struggles. They have tried every dirty trick in the book in order to divide the people, divert their struggles and defame their movement. Unable to provide even an attempt at democratic resolution, they have been dubbing all these movements as creations of the 'foreign hand'. Despite that the nationalities are valiantly fighting.

India is a country of many nationalities living under the yoke of oppressive ruling classes. The aspirations of these nationalities formed part of the anti-colonial movement but they were betrayed by the all-India ruling classes who, with the facade of federalism, created a unitary, authoritarian and centralised state. Even the constitutional powers or rights, limited though they are, of the states have been time and again trampled underfoot by the centre as the misuse of Article 356 or the financial devolutions to states starkly reveals.

The suppression of aspirations of all nationalities in different degrees and the brutal

repression of their struggles is an integral aspect of the anti-people and anti-national character of our state and ruling classes. Hence the democratic movement against their corrupt and venal rule must incorporate the nationality movements also. In fact, the Peru, Philippines and Indian revolutionary movements encompass both the national aspirations and the anti-feudal agrarian revolution and are surging forward to destroy imperialism and bring a new social order devoid of all sorts of oppression.

Imperialist compradors, national chauvinists have been united all the while in suppressing national aspirations. It is time for the nationalities in struggle and other anti-imperialist movements to develop strong bonds of solidarity with one another. Only such united struggle can destroy imperialism, the biggest foe of all the people of the world.

In India too there is a pressing need for the different nationality struggles as well as for the revolutionary movement to realise the commonness of their goals. Only in this way can the overall movement to build a new India go forward. It is with this view that All India People's Resistance Forum (AIPRF) is holding an international seminar on the nationality question at the MPCU Auditorium, Delhi from February 16 to 19, 1996. Among the participants will be William Hinton, author of *Red Sun* and *Shenfan*, authority on modern China; Ngũgĩ Wa Thiong'o, famous Kenyan writer; Jose Maria Sison, former chairman of the Philippine Communist Party; and Jan Myrdal, author of *India Awaits*. We appeal to all people to make the seminar a success by extending it all moral and material help.

Delhi-110 033

Dalit-Bahujan Forum

FORMATION of the Dalit Bahujan Intellectual Forum of India (Kancha Ilaiah August 5, 12) is welcome as an emancipatory endeavour. Realisation of the need to foreground or combine Ambedkarism with (the democratic practice of) Marxian materialism is equally welcome when attempts are made to reduce him/it into a cult, and also to counter his/its appropriation by the Hindu forces to frustrate the rise of mass consciousness necessary for establishing a casteless, classless and propertyless society. It is not quite off the mark to characterise the traditional Marxist practice in India as brahmanical Marxism, but the movement, in parts of Bihar and Andhra Pradesh, could not have escaped notice as outgrowing the bounds of brahmanical Marxism, provided it sheds

centralism and adventurist violence to become relevant to dalit-bahujan liberation.

The suggestion of the Forum meeting to restructure laws for radical redistribution of land, especially among women for cultivation and housing, is commendable. But this should extend to the restoration of the means of livelihood and production in the primary sector to all actual workers to break the patriarchal system and ensure gender equality. All primary producers should emerge as free and associated producers by their own struggles.

Syndicated entry into banking and finance and grant of licences presupposes prior attainment of resources and skills. Only a tiny top layer can gain as they already have done in the process of socio-economic class differentiation mediated by state policies and opportunities, however limited, thrown up by the predatory market economy. Higher education also by its very nature benefits a similar small segment. The two in conjunction with one another and in preference to urgent/prior universalisation of primary to high school education would strengthen the power of the elite over the masses. Will not this superior-led change on top of the existing non-dalit-bahujan versus dalit-bahujan and intra-dalit-bahujan contradictions further asunder the society? How would it square up with the breaking of the brahmanical stranglehold? And is not upholding the internally riven and contradictory social order the function of brahmanism?

Liberation of the dalit-bahujan masses must be won by themselves through a series of struggles/processes transforming circumstances and women/men. It is not the success of the few at the expense of their fellow humans. No amount of correct theory or vaunted democratic claims on the part of the elite can restore power to the toiling masses once it has passed from their hands, as it happened in the former USSR, which ultimately disintegrated and the fragments of which are now in the embrace of globalisers.

One cannot agree more with the promotion of dalit-bahujan productive intellectuality. But this can come through 'real movement, which abolishes the present [exploitative and rotten] state of things. This would need alteration of man on a mass scale in a practical movement' (of the masses) to change 'social relations, social practices, human society or social humanity' in satisfying their (basic) needs in co-operation with all fellow human beings. Would it not be imperative to transform the Intellectual Forum into a Mass Movement?

T D SOYANTAR

Ahmedabad

Not by Fire-Fighting

THERE is little to be gained by pointing out that the spread of malaria and the virtual breakdown of one of the oldest vertical disease control programmes have not come as a surprise. Yet it is necessary to do so in order to understand the extent of neglect health care has suffered in the last couple of decades. The spread of malaria and the state's response to it document, in no uncertain terms, the priorities of our model of capitalist growth with a welfare veneer.

The resurgence of malaria reported, in the last few months has been in the urban areas and metropolitan regions which make significant contributions to economic growth. The resurgence is not a regional phenomenon any more. Malaria appears to have made a comeback in Maharashtra, Karnataka, Assam, Orissa, West Bengal, Rajasthan, Haryana, Punjab and Gujarat. Most alarmingly, of the two million cases reported this year, half are of cerebral malaria. Nor for that matter is the reappearance of malaria a recent development. The National Malaria Eradication Programme achieved its best results in 1965 when the number of cases fell under 1,00,000 and that of fatalities to almost nil. But by the 1970s most of the problems that are so prominent today in large parts of the country were already becoming visible: resistance to insecticides in vectors, drug resistance in parasites, inadequate allocation of funds, administrative breakdown, inadequate water management and insufficient attention to health consequences of large construction projects, whether for irrigation, power or urban development.

Significantly, even as every episode of malaria epidemic in high profile regions has brought about changes in programme strategies, its continuous spread in tribal and remote regions appears to have created few ripples. Malaria has been considered to be endemic in these regions and little effort has been made to understand the epidemiology of the disease, conduct entomological surveys and devise and execute special programmes of control. This speaks of not only a lack of scientific enterprise but also a certain metropolitan arrogance on the part of health planners, an attitude which is in large measure a consequence of the location of health care in the capitalist scheme of things. Historically the capitalist state has taken cognisance of disease, whether cholera, typhoid or TB, only when it either affects the dynamics of production and/or the well-being of the ruling classes.

A survey by the NMEP directorate has brought out that the sharpest rise in cases of malaria have been in the tribal districts where not only has the programme collapsed but the health infrastructure, if it had ever been in place, has become dysfunctional. More than 64 million tribals live in regions which are termed malaria endemic. Moreover, the proportion of cases of *plasmodium falciparum*, which

causes the virulent cerebral malaria, has risen from 51 per cent in 1984 to 66 per cent in 1990. In West Bengal while the resurgence of malaria in the state recently has received wide publicity, in some districts such as Jalpaiguri the disease has been endemic for years.

The district had recorded 22,000 cases in 1992 which rose to 42,000 in 1994 and 27,000 cases had already been reported in the first half of this year. Cases of cerebral malaria had risen even more sharply over the period. And what is the status of the programme in this endemic region? Posts of technicians in several blocks are unfilled, no entomological study has been undertaken for want of entomologists, no attempt has been made to study the epidemiology of the disease, shortage of funds has consistently come in the way of timely spraying and so on. Another major problem has been the lack of local control over the different elements of the programme, making for inflexibility and failure to respond quickly to emerging situations.

Forced migration from tribal regions because of lack of development has contributed to the spread of the problem to the metropolitan areas and new regions opened up by developmental activity. The breakdown of the programme has been such that areas which are not considered epidemic prone have been unable to cope with the disease when it begins to spread. There are also several contributing factors. One is the collapse of public services in urban areas, especially consequent upon the spread of cities requiring reclamation of land. In Calcutta, for instance, the reclamation of the Salt Lake area and the draining of the wetlands have meant a choking of the drainage area for the city's sewage, resulting in the accumulation of semi-solid waste around the city. In the older pockets of Bombay, the age-old sewage and water systems have given way under the enormous growth of volumes, again resulting in inefficient drainage and the pooling of wastes. Around regions of new growth as a consequence of irrigation and power projects such as in parts of Maharashtra, Punjab, along the Teesta in West Bengal, around the Narmada project in Gujarat and along the Indira Gandhi canal in Rajasthan, poor drainage, waterlogging and an unbelievable lack of attention to micro planning has created extensive breeding grounds for the mosquito vector. No baseline or post-project entomological surveys have ever been undertaken in these areas. In addition to all this is the extensive misuse of drugs, partly because of miseducation and partly promoted by the growing tribe of private medical practitioners in these newly developing regions.

Given this background it is obvious that no solution can lie in short-term measures or attempts to remedy regional

lapses in the administration of the programme or taking state governments and municipalities to task. As early as 1981 the ICSSR ICMR report *Health for All: An Alternative Strategy* had warned that there was hardly any prospect of achieving substantial gains unless a breakthrough in technology occurs. It had recommended that research be undertaken on alternative methods of vector control and on reintroducing engineering and environmental measures used before the DDT era. In view of the apparent absence of research on programme strategies and technologies for the control of malaria these suggestions deserve serious attention today. Even more important it is necessary to restore the pre-1965 levels of investment on disease control programmes. The union government's expenditure on national disease programmes as a proportion of health expenditure came down from 27 per cent in 1965-66 to less than 5 per cent in 1993-94. Except Andhra Pradesh and Tamil Nadu, no major state spends more than 15 per cent of its health budget on disease control programmes. West Bengal spends just about 9 per cent and Assam a mere 7 per cent. Piecemeal and haphazard increases on particular programmes will only worsen the situation for other diseases left out of the largesse.

The resurgence of malaria is an indicator of a serious systemic problem whose roots go beyond the health sector. The model of health care adopted under the welfare framework in countries like India, where the health revolution which occurred in the western countries as a consequence of economic growth had not taken place, with control of diseases receiving high priority, needs to be re-examined. Clearly, the eradication of communicable diseases, even their efficient control, can only be achieved on a base of sustained and equitable social and economic growth. Adequate levels of food consumption, minimum standards of shelter and literacy and education are assumed components of disease control programmes; the absence of which affects their success. While intensive eradication and control programmes can bring down levels of morbidity quickly, they are no substitute for strengthening the social and economic base which itself can only follow political empowerment.

INDUSTRY

SAP's Bounty

WHEN the stabilisation and structural adjustment programme began in mid 1991, it was expected that there would be a marked slowing down of activity in the economy, which is of course what did happen. In 1991-92, the programme's first year, the general index of industrial production rose

by 0.6 per cent and GDP by 1 per cent. There followed in the next two years growth of 2.3 per cent and 5.6 per cent, respectively, in industrial production and of 4.3 per cent each year in GDP. It is remarkable, however, that the growth indicators for big manufacturing and service companies in the private sector remained as robust as ever.

According to a study of 520 public limited companies in the private sector in the financing portfolio of the Industrial Development Bank of India (IDBI), these companies' growth of gross fixed assets was as high as 27.8 per cent in 1991-92 against 20.6 per cent (for 505 companies) in 1990-91. Growth of net sales accelerated from 18.5 per cent to 21.3 per cent. In the following three years, growth of fixed assets remained high, between 23.5 per cent and 26.2 per cent, and of sales between 15.3 per cent and 24.7 per cent. Even allowing for inflation, the growth of fixed assets and sales in real terms of large companies in the private sector in the post-reform period has undoubtedly been very impressive.

Even more striking has been the rise in their profits and profitability. After large increases in 1990-91 and 1991-92, their profit before tax (PBT) and profit after tax (PAT) suffered a temporary setback in 1992-93 but in the next two years PBT rose by over 55 per cent each year, and PAT by 63.7 per cent in 1993-94 and 58.8 per cent in 1994-95. Return on sales (gross profit after depreciation as a percentage of net sales) showed a steady rise from 13.3 per cent in 1990-91 to 16.2 per cent in 1994-95. Operating profits as a percentage of sales too rose from 7 per cent in 1990-91 to 10.1 per cent in 1994-95.

However, because of the substantial addition to fixed assets during these years, return on capital employed did not go up, though it remained high at over 16 per cent. The ratio of capital employed to net value added rose from 2.92 in 1990-91 to 3.94 in 1994-95 and that of capital employed to value of output from 0.64 to 0.95. As a result, gross profit as a percentage of capital employed, which had been over 20 per cent in 1990-91 and 1991-92, was 17 per cent in the next three years. Gross profit as a percentage of total net assets, which had been 12.4 per cent in the first two years, remained below 12 per cent in the subsequent three years. Return on shareholders' capital (profits after tax as a percentage of net worth) which had been around 17 to 19 per cent in the first two years, fell to 13.9 per cent in 1992-93 but picked up to 15.5 per cent in 1993-94 and 16.6 per cent in 1994-95. Crudely measured, productivity of capital could be said to have gone down during the period, gross value added as a percentage of capital employed declining quite sharply from 40.82 per cent in 1990-91 to 28.91 per cent in 1994-95.

A factor which has contributed to the rapid rise in the profitability of industry is

the whopping rise in 'other income' which includes dividends and other earnings on financial investments. 'Other income' of the 520 companies in the IDBI study shot up from Rs 1,343 crore in 1990-91 to Rs 4,525 crore in 1994-95. As a percentage of PAT, 'other income' has been in the range of 40 to 42 per cent, indicating how a large proportion of the profits of companies has been coming from sources unrelated to their primary activities of manufacturing or providing services.

Interestingly, even as the companies' earnings from treasury operations have gone up, their own interest burden has declined. Interest and other financial expenses constituted 45.3 per cent of gross profits after depreciation in 1990-91 but fell to 35.4 per cent in 1994-95. It is, however, the tremendous saving in tax payments that has boosted the profitability of the corporate sector, a feature which was in evidence even before the current economic reforms, but has got markedly reinforced. Thanks to increased incentives linked to capital investment, corporate taxation as a percentage of PBT, 23.85 per cent in 1990-91 and 28.28 per cent in 1991-92, declined to 20.25 per cent in 1992-93, 15.85 per cent in 1993-94 and 13.99 per cent in 1994-95.

In the distribution of gross value added, interest and financial charges declined from 22.38 per cent in 1990-91 to 20.71 per cent in 1994-95. The share of wages and salaries likewise fell from 33.96 per cent to 28.41 per cent but that of profits before tax rose from 27.18 per cent to 37.93 per cent.

The growth of the large companies has been greatly assisted by support from the all-India development banks whose disbursements nearly trebled from Rs 7,351 crore in 1990-91 to Rs 21,800 crore in 1994-95. Significantly, during the same period, assistance disbursed by SIDBI and the state-level financial institutions intended for medium and small industries, rose much more modestly from Rs 2,964 crore to Rs 4,793 crore.

POIITICS

Pre-Election Posturings

THE pre-election intrigues and machinations have already begun, if some recent developments are any indication. Politicians in their individual capacities, as well as their parties on an organisational level, are preparing for alliances – caring two hoots for any ideological commitment from their would-be allies or for the bitter memories of mutual squabbles that ruined such alliances in the past.

Uttar Pradesh being the largest state and one which for historical reasons has played a crucial role in post-independence India in determining the fate of governments in New Delhi – the victory of the BJP in the civic polls there (although confined to only

25 per cent of the state's total electorate residing in the urban areas) seems to have set alarm bells ringing among its political opponents. Mulayam Singh Yadav of the Samajwadi Party (SP) who till the other day was treating the Janata Dal as an untouchable, worse than the Congress or the BJP, is now reported to be seeking a rapprochement with the Janata Dal leader V P Singh. Meanwhile, Mulayam Singh's *bete noire*, the Bahujan Samaj Party (BSP) is being wooed by both the Janata Dal and the Congress. Union food minister Ajit Singh (who is from Uttar Pradesh and, as the son of the late Charan Singh, expects dynastic loyalty from his strongly clannish Jat followers) has already begun negotiations with BSP leaders Kanshi Ram and Mayawati. He appears to be playing his cards right till now. In the recent civic polls, he was reported to have advised his followers in Meerut to work for the victory of Ayub Ansari, the BSP candidate for the mayoral post. The Congress Party thus hopes to garner votes from the Jat base (assured by Ajit Singh) and the dalit base (if Singh can strike up in alliance with the BSP) and (by its tacit support to the Muslim mayoral candidate) recapture the Muslim vote bank which it lost in Uttar Pradesh and elsewhere following Narasimha Rao's total surrender to the Sangh parivar which with complete impunity demolished the Babri masjid three years ago. It is yet to be seen however whether the voters will be taken in by the Ajit Singh-Kanshi Ram masquerade.

But such local adjustments, realignments and alliances in the states may not reflect the strategies of the parties and leaders at the national level. While in Uttar Pradesh or a few other Hindi-speaking states some Congress leaders may come up with tacit understandings with candidates from other parties to defeat the BJP in Delhi, their leaders are playing their own games, with quite a few among them smuggling up to the BJP. Union home minister S B Chavan in particular raised the hackles of his own partymen when he recently attended a colourful ceremony organised by the BJP to mark its completion of two years in power in Delhi and praised its performance. His colleagues in the party were at the same time demonstrating in the streets protesting against the all round failure of the BJP government in Delhi. Some days earlier, Chavan had indirectly soothed the Sangh parivar's sentiments by asserting that he saw no reason why he should apologise for the demolition of the Babri masjid. By his outbursts against US 'evil designs' on Kashmir, he is making the right noises that are calculated to please the BJP super-patriots who, sensing the popular mood of disenchantment with the US-dictated liberalisation programme, have switched from their erstwhile pro-US stand to anti-US slogan-mongering.

In the event of a hung parliament at the end of the polls next year, it is not only the present incumbent Narasimha Rao who will have to seek the support of the BJP or other opposition groups/ fronts to be able to hang on to the prime minister's chair, but ambitious aspirants like Chavan also will be compelled to resort to the same stratagem to replace him and occupy the chair. The shifting alliances among the parties and the overtures among the politicians that we see today are a sign as much of their preparation for fighting the coming elections as of the post-election strategy of finding a niche in the ruling block whichever combination comes to power in the centre.

IMF SURVEILLANCE

Only for the Poor

STRENGTHENING of IMF surveillance is the buzz word in conferences on international finance. This, we are told, is the lesson of not only the Mexican financial crisis but also of the recent ups and downs in the dollar's exchange rate vis-à-vis the yen. But are we sure that strengthened IMF surveillance will apply equally to the major industrial countries? Will they subject themselves to that discipline?

G-7 countries are more concerned with IMF surveillance over developing countries than with strengthening the IMF's surveillance over their own policies, observes Charles Mallara, managing director of Washington-based Institute of International Finance, who was earlier representing the US on the IMF's board as an executive director. And who would know better than Mallara, representing as he did none other than the US on the IMF's board?

But if the IMF's strengthened surveillance has to have credibility, Mallara is convinced that its ability to exercise surveillance over the major industrial countries is critical. The fact remains, however, that when it comes to themselves, the industrial countries have tended to be very cagey in accepting IMF's surveillance. In this context, the two communiqués, one issued by G-10 and the other by G-24, are worth comparing. While the latter group, representing the developing countries, endorses in principle the procedures recently established at the IMF to strengthen its surveillance role, the former group, representing the major industrial countries, chooses not to refer directly to the subject of IMF surveillance. Instead, referring to reports on the continuing efforts to underpin the stability of financial markets by enhancing supervision, promoting transparency through improved disclosure and fostering the reliability of payments and settlement systems, the group just reaffirms the importance of strengthening safeguards against systemic risk without any commitment whatsoever.

that the countries are willing to let the IMF do the surveillance over their policies in this regard.

It is interesting that the IMF managing director went out of his way in his address to the 50th annual meeting at Washington to say that of the 30 countries he or his three deputies visited to press points of concern in our surveillance, six were major industrial countries. What he did not say is how receptive these industrial countries were to the points of concern conveyed to them by the IMF. If Charles Mallara is to be believed, the IMF's points of concern may well have been politely but firmly consigned to the dustbin by practically all the six industrial countries. Whether the IMF likes it or not, the fact is that the industrial countries have not recognised not yet that they need a multilateral agency, not even one they control to monitor their policies.

MAHARASHTRA

RPI's Quest for Relevance

ATTEMPTS to unify the many factions of the Republican Party in Maharashtra representing the dalits have generally taken place on the eve of elections. The latest declaration by leaders of the RPI factions affirming their intention to merge thus conforms to tradition. The only difference, a significant one perhaps, is that on all the previous occasions the Congress Party had been in power in the state and had successfully sabotaged the RPI's unity plans, whereas it is now out of power. This means that since there is no possibility of a unified RPI entering into an alliance with the Shiv Sena-BJP, the Congress has little to fear from Republican unity.

But this is no assurance that it is going to be smooth sailing for Republican Party unity. With the Congress unable to put its house in order for the past one year, the Republican Party, even if it achieves a measure of unity, could suffer further marginalisation in Maharashtra politics. The Athavale faction of the party is facing an internal crisis with its two foremost leaders, Ramdas Athavale and T M Kamble, squabbling over a legislative council seat. While a decision had been taken to conduct a united rally on December 6 by a committee headed by B C Kamble, Athavale tried to hold a separate rally of his own at the Shivaji Park in Bombay on that day. He gave up the attempt only when the gathered dalit masses rebuked him. To mention another issue, Prakash Ambedkar's term as a Rajya Sabha member is about to end. Since his RPI (Ambedkar) Bahujan Mahasangh had failed to win a single seat in the last state assembly elections, the Rajya Sabha seat is bound to become a bone of contention. The Shiv Sena-BJP government has in the meantime decided to

withdraw a large number of cases registered under the Prevention of Atrocities Act. This is a political challenge which the Republican leaders cannot evade.

What will be the electoral strategy of the Republican Party in the forthcoming elections, even if the various factions succeed in hammering out a common programme? Athavale has announced the severance of his ties with the Congress with the reciprocal expectation from Prakash Ambedkar that he would similarly distance himself from the Janata Dal and the left forces. In that case, will the Republican leadership, which claims to control the 7 per cent Buddhist vote in the state, make a significant impact in the elections? Should the Republican leadership turn down an understanding with the so-called third front and choose to contest the elections on its own, will that not indirectly help the SS-BJP? If Athavale stays firm in his objection to an alignment with the Janata Dal left forces, the new-found Republican unity itself may be imperilled.

The Shiv Sena-BJP combine, for its part, has been trying to mobilise non-Buddhist dalit groups, the chambhars and matangs, mainly in the state, though it has been careful not to make anti-Ambedkar public statements. The alliance has floated the Maharashtra Charkar Sangha, but on the occasion of its launching, Baharrao Gholap, a chambhar leader, and others spoke of the relevance of Ambedkar. The incidents of the defacement of Ambedkar's statues in Jalna and other places during the Congress regime is also being exploited by the alliance. When it was in the opposition, the Shiv Sena often indulged in such actions and provoked sectarian violence. But now that it is in power, it blames Pakistan's ISI for the incidents.

Thus even if the Republican leadership succeeds in agreeing on a common programme on December 25 and thus raise expectations of the Republican Party re-emerging as a significant force in Maharashtra politics, its stand vis-à-vis other political forces in the state will be crucial in determining its role and influence in the coming Lok Sabha elections.

BOSNIAN AGREEMENT

Better Than None?

UNDER heavy pressure from the US government, on November 22 the presidents of Serbia, Croatia and Bosnia initiated a peace accord to resolve the four-year-old conflict in Bosnia-Herzegovina. As with the previous peace proposals, this plan embodies the principle of ethnic separation by dividing the country into two parts, a Muslim-Croat federation and a Bosnian-Serb entity, theoretically united within a single state with a weak central government. By pushing for this settlement, the US and

the NATO countries have tacitly accepted the notion that the various ethnic groups of the Balkans cannot live together. This is in line with the emerging dominant view that attributes ethnic conflict to irrational 'primordial' forces rather than to political manipulation. Thus, the agreement in effect legitimises the horrifying policy of 'ethnic cleansing' which the Bosnian Serbs, supported by Serbia, carried out with impunity while the same countries which are now so keen on 'peace' stood by and watched. Now that much of that process has been completed—producing two million refugees driven from their homes, not to mention a quarter of a million dead or missing

and the Bosnian Serbs have begun to face military setbacks, the US has used the opportunity to present itself as a saviour which is making the ultimate sacrifice by committing 20,000 troops to the planned 60,000-strong NATO peace-keeping force.

For Clinton this is an about-face from his earlier stand condemning the policy of ethnic cleansing, although Secretary of State Warren Christopher has tried to present the agreement as a victory for all those who believe in a multi-ethnic democracy in Bosnia. For the Muslims and many others in Bosnia who were always in favour of maintaining the multi-ethnic character of the country, the pact can hardly be termed a victory, although the Bosnian prime minister has claimed it as one. While it may appear that the Muslims have gained from the settlement at the expense of the Serbs, who have failed to achieve their goal of a greater Serbia, in fact it implements the Serbs' desire for ethnic separation and practically recognises the status quo in regard to territories held. Although they have accepted the agreement as the best they can now hope for, Muslims will not easily forget that they were left to resist Serb aggression and their ethnic genocide for so long without visible support from the international community, which refused to lift the arms embargo.

The agreement is flawed in many other ways as well, which makes its workability far from certain. First, a section of the Bosnian-Serb leadership is opposed to the plan and promises to pose a threat to its implementation, although their participation may well be forced by Serbian president Milosevic. Serbs in Sarajevo have also been demonstrating against the provision that keeps the city united and part of the Muslim-Croat federation. Second, the agreement gives people the right to return to their homes but this is hardly likely to happen, ethnic cleansing is already a *fait accompli* in many places and will not be easy to reverse. Third, while indicted war criminals are proscribed from holding public or military office, there is no provision that ensures their arrest or trial. Fourth, the two constituent units of the reconstituted Bosnian state will be allowed to keep their

own armies—hardly an auspicious sign for unity—and the proposed Muslim-Croat federation itself is likely to be very fragile. Finally, the deployment of NATO forces as per the plan is in question, as is their ability to actually implement the agreement rather than to further complicate an already tortuously complex political situation.

A moot question is to what extent Clinton's sudden commitment to a peace agreement in Bosnia was determined by political compulsions—i.e., the 1996 elections. Having failed to produce most of his promised domestic reforms, Clinton may be banking on successes in foreign relations, especially of the peace-making kind, to see him through the election. Closely following the Bosnian accord came his visit to Ireland and Northern Ireland, during which he posed as a prophet of peace. Perhaps Clinton hopes that even if the American people look askance at such foreign adventures and are unlikely to vote him back to office on their account, at least he will go down in the history books as a great statesman. If this is the real reason for the haste with which the agreement was pushed through, it is all the more reprehensible, for by accepting the logic of political division of territory along ethnic lines, the 'peace' accord may well encourage similar wars in other parts of Europe.

Still, there is something to be said for the view that any sort of peace is better than none at all, especially in light of the inhuman atrocities that have been committed during the course of this conflict. One can only hope that the agreement does indeed lead to peace rather than to further violence in the name of self-determination.

CURRENT STATISTICS

EPW Research Foundation

The annual inflation rate declined further to 8.1 per cent in the week ended November 18 although the WPI for all commodities at 299.1 continued to show a rise. The rise in net RBI credit to the centre touched the record level of Rs 19,350 crore compared to a decline of Rs 975 crore in the corresponding period last year. The general index of industrial production rose by 11.5 per cent during April-July compared to 8.9 per cent in the comparable period last year. Exports rose by 24.5 per cent in April-October 1995 and imports by 30.8 (non-POL imports by 34.8 per cent) thus further widening the trade deficit to \$2.7 billion. Petroleum products, capital goods and chemical products continue to be the main contributors to the sharp import growth while food and live animals, ready-made cotton garments, gems and jewellery, chemicals and chemical products and capital goods constitute the major exports.

Figures in brackets are percentages to total. ^a Excludes gold and silver imports through passenger baggage.

Notes: (i) Superscript numeral denotes month to which figure relates, e.g. superscript * stands for September. (ii) Figures in brackets are percentage variations over the period specified or over the comparable period of the previous year. — means not available.

RANBAXY LABORATORIES

Focus on R and D

RANBAXY, one of India's largest pharmaceutical companies, achieved a sales turnover of Rs 666 crore for the year ended March 1995 up by 19 per cent from Rs 561 crore in the corresponding period in the previous year. Other income rose from Rs 2 crore to Rs 9 crore taking total income to Rs 704 crore up by 24 per cent from Rs 565 crore in the previous year. As in the previous year the company incurred zero interest costs. Provision for tax and for depreciation rose by 29 per cent and 953 per cent respectively. Nevertheless the company ended up with a net profit of Rs 110 crore up by 74 per cent from Rs 63 crore in the previous year. A major contribution to the bottomline came in the form of non-operating profit of Rs 20 crore against a loss incurred in the previous year on this count. A dividend of 30 per cent has been recommended by the directors.

Ranbaxy has eight technologically advanced plants which have been designed to international specifications. The company has a state-of-the-art instrumentation system for chemical and sterility testing and an on-line system for material management inventory control and production planning resulting in lower costs increased productivity as well as consistent product quality. The company has a strong distribution network being able to reach customers through more than 1,400 stockists.

The company currently exports its products to over 40 countries with marketing operations in 20 of them in addition to having manufacturing facilities in six countries. The exports of the company stood at Rs 296 crore, up by 37 per cent from the previous year. A corresponding rise was seen in imports which moved up by 39 per cent from Rs 127 crore to Rs 176 crore.

During the year under review plants for manufacture of ranitidine and amoxycillin and a pilot plant for R and D in Punjab were commissioned. The new plant for manufacture of pharmaceutical dosage forms in Himachal Pradesh commenced commercial production in August 1995.

Ranbaxy has floated a new fully-owned marketing subsidiary, Solus International. The company has plans to launch eight high-end products with two more to be added in the second stage and four more by mid-1996. The products marketed by Solus include medicines for cardio-vascular diseases, antibiotics and nutritional products and will be launched initially in selected states.

The company has set up a joint venture company in equal partnership with Eli Lilly and Company of the US at Ropar in Punjab to manufacture multi-source pharmaceutical products such as anti-infectives, cardiovascular and anti-cancer drugs besides research and development activities. The Rs 155 crore project will be financed through 50:50 equity by the two partners. The company's joint ventures in Malaysia, Thailand and Nigeria are performing well. The company is holding discussions with the partner in the joint venture in Canada for firming up plans to strengthen its operations and for expansion.

The company's strength lies in research and development and world class manufacturing facilities. A scientific advisory board consisting of eminent scientists from India and abroad has been constituted to advise and provide direction to its research efforts. The company has set up an ultra modern research centre in Delhi. The company has also initiated efforts towards commencing research activities for synthesis of new chemical entities. The company is developing a number of drugs whose patents expire in the next 5 to 10 years and Ranbaxy's R and D activities will give it the necessary edge. A scientific advisory board consisting of eminent scientists from India and abroad has been constituted to advise and provide direction to its research efforts. The company

has set up an ultra modern research centre in Delhi. The company has also initiated efforts towards commencing research activities for synthesis of new chemical entities.

Ranbaxy today is second in the market for drugs and pharmaceuticals. Intense competition in future will depress margins and prompt companies to look to the export market as a way out. Ranbaxy is well placed to take advantage of the opportunities that this scenario will present. By the turn of the century Ranbaxy hopes to derive 50 per cent of its sales from exports. Also on the anvil is a plan to shift to formulations from bulk drugs. The company plans to penetrate the US generic market. Poland, South Africa and Vietnam are likely to be the key new markets.

INDIA CEMENTS

Rise in Demand

India Cements, incorporated in 1964, has two plants in Tamil Nadu and one in Chilamkur in Andhra Pradesh. The company, a leader in the south, has a 26 per cent market share in Kerala and 19 per cent in Karnataka. The company's plants are located close to the limestone deposits, as also close to the ports. The company uses lignite instead of coal in its manufacturing

process and, since the Neyveli lignite site is very close to the company, is able to source lignite cheaply. The Neyveli site being the only supplier of lignite to ICL in this region, the entire production activity of the company depends on it.

The company closed the financial year ended March 1995 with a sales turnover of Rs 544 crore up by 17 per cent from Rs 463 crore in the previous year. Other income rose by 138 per cent from Rs 3 crore to Rs 7 crore. Total income earned by the company increased by 18 per cent from Rs 468 crore to Rs 554 crore. Interest costs came down by 5 per cent. Provision for depreciation rose by 14 per cent. The company ended with a net profit of Rs 47 crore up by 156 per cent from Rs 18 crore in the previous year. A dividend of 40 per cent has been recommended by the directors.

Exports came down as a result of the firm domestic demand in 1994-95 and stood at Rs 10 crore down by 59 per cent from Rs 24 crore in the previous year. The company's export market comprises south east and west Asian countries. Imports on the other hand rose by 273 per cent from Rs 9 crore to Rs 35 crore.

The prospects for the cement industry are bright with emphasis on the development of housing, highway infrastructure and irrigation. The projected demand for cement in 1995-96 according to the Development Council for Cement Industry is 77 million tonnes including 5 million tonnes for export. The total installed capacity is expected to be around 90 million tonnes. By the turn of the century demand is estimated at 87 million tonnes with an installed capacity of 100 million tonnes. The projections are based on an estimated annual growth of 7 to 8 per cent.

The company was plagued by rising costs in the form of power tariff and railway freight. Added to this was the increase in labour costs. In 1994-95 the consumption of coal per unit of cement went down from 32 to 28 for the wet process and 23 to 19 for the dry process. This was mainly due to the better quality of coal which despite being expensive worked out much better. The company incurred an expense of Rs 24 crore on this count but favourable demand conditions enabled the company to pass on these cost increases to its customers.

The company has three divisions — cement, shipping and property development. Cement continues to be the major contributor with 90 per cent. The Shankernagar cement plant achieved a capacity utilisation of 106 per cent and the Sankari plant of 101 per cent. Capacity utilisation at the Chilamakur plant was 90 per cent.

The shipping division recorded a turnover of Rs 53 crore, lower than in the previous year, because of the lesser number of voyages performed by the chartered vessels. The

company owns and operates self loading dry bulk carriers which are either time charters or hired out on voyage and spot charters. The future plans of the shipping division include acquisition of another bulk carrier at an estimated cost of around \$ 10 million to be funded mainly through debt and internal accruals. The company has taken delivery of an additional ship which commenced operations in September.

The operations of the real estate and property development division, though low key, continued to be profitable. The division was involved in the construction of residential plots and developed and sold plots as a part of its operations during the year under review.

To consolidate and improve its position in the cement industry, the company has a number of plans on the anvil. It plans to set up a 7 lakh tpa dry process unit at Shankarnagar to be operational by 1996. The project estimated to cost Rs 250 crore has been funded through a mix of Euro issue proceeds, debt and internal accruals. Plans are on to buy viable units from Tamil Nadu Cements and Texmaco. The bottlenecking of the Chitlamakur plant is on the anvil. Estimated to cost Rs 30 crore, this plant will increase capacity from 3,000 tpd to 3,300 tpd to achieve 100 per cent capacity utilisation from the current 75 per cent. The company is setting up a new plant with a nine lakh tonne per annum capacity at Dalvi or near

Trichy at a cost of Rs 280 crore. Commercial production is expected to commence by January 1997.

The company installed windfarms with a capacity of 10 MW during the year under review.

MIRC ELECTRONICS

Gains of Competition

Incorporated in 1981, the Onida group manufactures a wide range of electronics goods, namely televisions, video cassette recorders, audio systems, air conditioners, washing machines, electronic tuners, etc. The other group companies are Onida Saka, Onida Savak and Monic Electronics. MIRC Electronics, the flagship company of the Onida group, is a strong player in the TV and VCR segment and its products are manufactured under the brand name of 'Onida'.

The company closed the year ended March 1995 with sales turnover of Rs 288 crore up by 44 per cent from Rs 200 crore in the previous year. Other income rose by 54 per cent from Rs 87 lakh to Rs 1.4 lakh taking the total income earned by the company to Rs 296 lakh up by 45 per cent from Rs 205 lakh in the previous year. Interest cost rose from Rs 58 lakh to Rs 2 crore. Provision for depreciation and tax increased by 38 and 43 per cent respectively. Aided by non-operating profit of Rs 46 lakh against Rs 5 lakh

in the previous year, the company recorded a net profit of Rs 21 crore up by 24 per cent from Rs 17 crore. A dividend of 60 per cent has been declared by the company.

Reduction in import tariffs and duties coupled with an atmosphere of liberalisation has provided the much needed impetus to the electronics industry. Consequent to the rationalisation of prices in the market as a result of increased competition, the demand for consumer electronics products has risen up. The demand for colour TVs grew by 30 per cent in 1994-95.

The company's manufacturing unit at Wada has commenced commercial production and is fully geared for commercial production. The company has significantly upgraded its research and development capability which has enabled it to introduce new models both in the black and white and colour TV segment. For the year under review, the sale of colour TVs increased by 30 per cent while the company increased its sale of black and white TVs by 70 per cent. In the audio market, the company introduced three models targeted at different segments of the consumers. The video market was sluggish in 1994-95. Anticipating the video market to stabilise in the near future, the company is planning to launch a new range of VCRs and VCPs in the current year. The company has been accredited with the ISO 9000 certification for the year under review.

NETAJI INSTITUTE FOR ASIAN STUDIES

1 Woodburn Park, Calcutta - 20

Advertisement No. NI/EAS/04/95

Applications, typed in triplicate, giving full particulars and supporting documents are invited for the following posts borne on UGC scales of pay plus allowances as per State Government rules.

- I **Professor** (1 each) in (a) International Relations (b) Social and Political History (c) Economic Cooperation
- II **Asstt Professor** (1 each) in the said subjects (equiv. to Reader's position)

Qualification: As prescribed by UGC for similar posts with consistently good academic performance at all stage plus formal evidence of research/published work of high standard in the prescribed thrust area indicated below.

- a) Current trends in regional peace and cooperation, particularly in the context of the new economic agenda of West Bengal, with due emphasis on pre and post colonial linkages.
- b) Syncretistic tradition in religion in South Asia.
- c) INA & its impact on Transfer of Power to India.

N.B. 1) Candidates should hold Master's degree with Honours in International Relations/Pol Science/History for (a), Political Science/History/Sociology for (b), and Economics for (c).

2) Selection need not be restricted to those who formally apply.

3) Selected candidates will have to work for time bound projects having direct bearing on the prescribed thrust area.

4) For the post of Professor, probation will be as per rules of the Institute. Appointment to the post of Asstt Professor will be contractual for a maximum period of three years.

5) Age Below fifty, relaxable in case of outstanding candidates.

6) Particulars required. (i) Name, (ii) Address, (iii) Date and place of birth, (iv) academic qualifications, (v) professional track record, (vi) research, and (vii) publications with duly attested supporting documents for (iii) and (vii).

7) Last Date of receiving application - 31st December, 1995.

Linked Markets, Unlinked Policies

The last two months' developments in the foreign exchange and money markets have thrown into sharp relief the close linkages developing between the two markets. While the Reserve Bank managed to stabilise the spot foreign exchange market by injecting the equivalent of \$1 billion in October, the impact of its intervention was felt in the extreme stringency in the money market as reflected in the shooting up of call money rates which, in turn, led to a speculative surge in the forward premia on the dollar.

I An Overview

THE money market turned extremely stringent and highly volatile during November with the overnight call money rates exhibiting on some days even intra-day variation of 40-80 per cent. The upheaval in the call money market was a carry over of October developments in which the proximate cause for accentuating the stringency was that the Reserve Bank of India was forced to intervene in the foreign exchange market which absorbed liquidity and which continued for nearly three weeks in that month. Fearful of inflationary implications and also the possible pressure on the dollar, the RBI was fine-tuning its support to the money market with the outstandings of its support fluctuating from Rs 2,453 crore on October 16 to as low as Rs 399 crore on October 28. This only compounded the pressure on the liquidity in the market which has been a phenomenon since the beginning of the current fiscal year.

The sluggishness in bank deposit growth has been a constant feature this year. After some pick up in August-September, aggregate deposits of scheduled commercial banks even registered a small fall of about Rs 295 crore in late October-early November. Overall, since March 31, aggregate deposits have registered an increase of Rs 10,793 crore against Rs 23,356 crore during the same period last year. On the other hand, after sharp increases in previous months, non-food bank credit growth showed some deceleration during October-November. Even so, with the corporates increasingly relying on cash credit and overdraft accounts with banks due to the drying up of other sources like CP, there has been a rise in non-food credit of Rs 15,239 crore as against only Rs 7,428 crore during the comparable period last year.

The sources of the sluggishness in bank deposit growth and domestic liquidity are varied. A foremost factor seems to be the trends in the external sector where, apart from the direct erosion of about \$3.2 billion of foreign currency assets worth about Rs 11,000 crore, the official and

private imports of gold and silver seem to have further depleted which does affect potential domestic liquidity by siphoning off foreign exchange through the *havala* market. These factors are certainly affecting domestic saving. The domestic saving may also have been affected by possible fluctuation of money incomes of saving classes after the initial flush fell with the liberalisation credit-based consumption and the persistent erosion in purchasing power among the middle and lower classes. There has also occurred drastic reduction in portfolio investments.

The sizeable import surplus and other forces operating on the external sector have helped to arrest the growth in reserve money despite massive increases in net RBI credit to the central government and in particular through *ad hoc* treasury bills. The peak of Rs 21,500 crore is on August 5. The RBI did manage to bring down the expansion in *ad hoc* bills to a level of Rs 6,000 crore on September 22 and further to Rs 6,440 crore on September 29. After remaining at these levels for barely two weeks, the declining trend could not be sustained. The government borrowings through this instrument passed through the Rs 7,000 crore limit once again and has been running over it now consecutively for six weeks and was at Rs 12,100 crore as on November 10. The RBI refinancing facilities and support to the money market have been rigorously diluted. The external sector developments have also constrained the money multiplier process, with the contemporaneous incremental multiplier remaining as low as 1.75 as against the annual average for the past many decades at about 3.20.

The happenings in the domestic foreign exchange and money markets during the past two months have clearly brought to the fore the close interlinkages between the two markets. After intervening for nearly three weeks and injecting foreign exchange worth approximately \$1 billion during October, the RBI succeeded in stabilising the spot foreign exchange market. With a shift in the RBI stance in favour of intervention when warranted, the spot market remained largely stable, except for a few hiccups towards the end

of November, but the overnight money market rate remained high and highly volatile despite the RBI injection of liquidity on a daily basis. The stringency in the overnight call market was in turn felt on the forward premia for one day to six-month dollars which came under severe speculative grip. The volatility in the forward market more prominently in cash, tom and cash spot rates was due to significant arbitrage possibilities between the two markets. As the call rates reached dizzy heights, dollar-rich banks, mostly foreign banks, sold dollar cash and purchased dollar in the tom (one day) and spot (three days) market. The immediate cash proceeds were deployed in the money market reaping sizeable arbitrage benefits. This warranted the Reserve Bank intervention in the forward dollar market but again with small amounts of interventions, the forward premia remained high (see 'Current Statistics' December 2, 1995).

Significantly, the developments of November highlighted rather sharply the dilemma that the authorities have begun to face due to various contradictions in public policies. With the avowed objective of containing inflation through monetary control, the burden of financial management has entirely fallen on monetary policy at a time when the fiscal situation seems to have almost gone out of control. Growing fiscal needs and large monetized deficit have begun to preempt bank credit and thus, almost for the first time in the Indian economy, the government demands are seemingly crowding out commercial sector credit needs. Besides, the government has accepted the principle of borrowing at market-related rates through the auction process. During the current financial year, however, during the initial few floatations which were on auction basis, the RBI has virtually abandoned the auction process for government's borrowing programme and has issued fixed coupon paper, though at a high coupon rate of 14 per cent. Despite protestations to the contrary, there is no doubt that such a policy is not sustainable in the present *milieu*. Also, with about Rs 25,000 crore of excess SFR securities, the market is not inclined to absorb more of government paper. Against such a background, the RBI is extremely hard put to see through the government borrowing programmes even by the age-old *modus operandi* of moral suasion.

With a view to releasing long term resources, the Reserve Bank announced a reduction in CRR by half a percentage point to 14.5 per cent from November 11. On November 29, the Reserve Bank announced CRR exemption for the incremental FCNR (B) deposits over the level of November 24, and now even the average CRR applied to the outstandings of the same deposits has been reduced

GRAPH A DAILY TOP-END QUOTATIONS OF CALL MONEY RATE
OCTOBER 1995 AND NOVEMBER 1995

from 14.5 per cent to 7.5 per cent. All these are expected to release over Rs 4,000 crore of additional liquidity during the current fiscal year. Secondly, the RBI relaxed the scheme of money market mutual funds (MMMFs) and decided to permit the private sector mutual funds to set up MMMFs. To make the scheme more attractive, the RBI withdrew the ceiling on the size of the MMMFs and limits on investments in individual instruments. The original scheme was announced way back in April 1992 but had refused to take off. Finally, to ease the liquidity situation and to prevent further fall in the value of the rupee, the government on its part has eased the norms for the deployment of funds raised through global depository receipts (GDRs) and external commercial borrowings (ECBs). The changes included permission to remit freely Euro issue proceeds immediately in anticipation of the approved end uses, to structure the borrowings as foreign currency convertible bonds (FCCBs) and to utilise 25 per cent of issue proceeds for corporate restructuring and working capital requirements instead of the hitherto 15 per cent.

II

Money Market gyrations

Call money market

As said earlier, the overnight money markets witnessed quantum jumps and high volatility during November. According to the RBI spokesman, the Bank had

withdrawn its support from the domestic money market in an attempt to starve the market of rupee resources; this was done with a view to stabilising the foreign

exchange market in which demand for dollars had far exceeded its supply. Once the foreign exchange market stabilised at Rs 34.50/90 a US dollar and remained at this level for nearly three weeks, the Reserve Bank entered the money market once again and with a daily average intervention of Rs 2,000 crore during November, which brought the rates in this market down to 21.24 per cent from a high of 70.80 per cent (see Table 1). Amongst the bulk flows, banks had to pay the third installment of the partly paid security issued in September which was Rs 1,100 crore, while the inflows aggregating Rs 1,500-2,000 crore were due during November 15-30 on account of interest payments on various government paper.

After opening at 15 per cent on the first day of the new reporting week, the rates in the call market went up to 25 per cent on Monday, October 30, and from then on continued their upward trend till they reached 85 per cent on November 3. Small deals were also reported at over 100 per cent. As banks went berserk borrowing at very high rates, the Reserve Bank tried to cool the market through repos done with DIII and SICI and persuading financial institutions to lend in the call money market at 25 per cent. The Reserve Bank support to the market during this week ranged from Rs 900 crore to Rs 2,700 crore. Ironically, NABARD, which has no funds of its own but only draws lines of credit from the Reserve Bank, was also seen lending at very high rates in the call market.

GRAPH C ANNUALISED DAILY 1 MONTH 3 MONTH AND 6 MONTH FORWARD PREMIA IN PERCENTAGE FOR THE US DOLLAR IN THE DOMESTIC INTER-BANK MARKET

Some banks were also reported to have consciously decided to default on CRR rather than borrow at astronomical rates to maintain it.

Interestingly, foreign banks and the new private banks which have remained meagre participants in this year's government market borrowing programme turned out

to be losers as the RBI intervention funds were lent at 25-26 per cent only against the repo of securities. The central bank under the Reserve Bank of India Act cannot lend clean. As these banks had little excess SLR securities in their portfolios, they had to borrow from the market at high rates. Banks could also in general not avail much of the repo facility from the DFHI as it dealt mainly in treasury bills and banks do not have a large portfolio of short-term paper.

The second week (November 4-10) which was also the reporting week, saw an intensified turmoil in the money market with the call rates remaining highly volatile ranging from 25 per cent to 142 per cent. The Reserve Bank was also keen to affect the sentiments of the market to steer the second tranche of Rs 1 500 crore worth of state loans to be floated on Monday November 6. The issue received Rs 2 388 23 crore. It is well known that the Reserve Bank fixes quotas for banks to participate in state loans. The RBI intervention in the money market too was the highest at about Rs 5 600 crore on November 8. Banks reportedly borrowed even on the reporting Friday (November 10) at even 40 per cent rates of interest which was prompted by a treasury calculation that the cost of maintaining CRR or these funds would be cheaper than the cost of borrowing on non-reporting days.

The RBI took no chances in the third week (November 11-17). Apart from rolling over Rs 4 600 crore of repos from the previous week it injected sizeable fresh funds (Table 1). State Bank of India was a borrower in this week as it had to purchase dollars to make oil payments as also to redeem CDs issued to PSUs to abide by the DPII regulation of investing PSU funds only in rated CDs. Though the fluctuations were reduced the call rates nevertheless remained high in the range of 25-45 per cent (Table 2).

The fourth week of the month (November 18-24) was a reporting week and the persistence of RBI intervention though on a reduced scale of an average Rs 2,000 crore brought the rates down from 35-40 per cent to about 10-12 per cent but within it the range of fluctuations remained high (Table 3). As no major outflows were expected this week the RBI was seen to be tapering off its support to the money market.

Foreign Exchange Market

The RBI had succeeded in bringing the spot rate for the US dollar under control

as the rates stabilised at Rs 34.50/90 for nearly three weeks by the end of October. As the money market reeled under pressure caused by RBI intervention in the foreign exchange market, the forward rates for dollar swung to higher levels. Between November 4 and November 17, the six-month annualised forward premia went up from 11-12 per cent to 18-20 per cent, while the annualised one-month premium went up to as high as 37 per cent. The sharp swing in the forward premia forced the Reserve Bank to intervene in the forward market by conducting swaps. This was an interesting development as after the foreign exchange crisis of 1991, the Reserve Bank had consciously closed the swap window. The development was also significant in the perspective of the Sodhani Committee report on the development of the foreign exchange market which had suggested that the Reserve Bank should influence the forward rates by conducting swaps. According to the Committee, by selling dollars spot and buying forward, the Reserve Bank would be able to influence the spot and forward markets with only a temporary depletion in the foreign exchange reserves. After touching a high of about 20 per cent, the forward premia started cooling somewhat and returned to 13-14 per cent levels by the

end of November. However, even at this level the premia remained high and the US dollar got quoted at Rs 37.41 as against the spot rate of Rs 34.81.

The stringency in the money market made it imperative for the central bank to do only purchases of government securities in its open market operations: it purchased paper worth Rs 248.70 crore during November.

III Primary Market Operations

Dated Securities

The month opened with the second tranche of the 10-year 14 per cent State Development Loans of Rs 1,500 crore for

14 states. It opened on November 6 when the funds position in the money market was at its worst and there were fears of undersubscription. The Reserve Bank nevertheless ensured its smooth sailing, received Rs 2,388.23 crore as subscription and retained the oversubscription.

Towards the end of the month, the government of India issued one more dated security - the 10-year 14 per cent paper floated on November 27. This was the third issue of the same paper issued twice earlier in June. A further loan floatation worth Rs 1,500 crore at this point could hardly be expected to receive good response. It was unlikely that even the RBI expected the paper to go through smoothly, but apart from the backlog in the government's borrowing programme, the

RBI is committed to sell fresh government paper so as to bring down the levels of *ad hoc*s. Even if it meant that the Reserve Bank would have to take the slack, the RBI, guided as it is by the philosophy of forcing the government to reduce borrowings in response to high interest rates, would prefer to lend to the government at market-related rates rather than at 4.6 per cent through the *ad hoc*s. As expected, with Rs 787.33 crore, the

market subscribed only 53 per cent of the issue and the rest Rs 712.67 crore devolved on the RBI.

In less than two weeks, the government accessed the market once again for an amount of Rs 2,000 crore. It announced the sale of four-year floating rate bonds (FRBs) linked to the six-monthly average rate of 364-day TBs. The rate of interest offered for any half-year will be 1.25 percentage points over the average rate of 364-day

TBs auctioned during the previous six calendar months; it will have a floor rate of 13 per cent and a rate of 13.73 per cent for the initial half-year ending March 29, 1996. This paper was offered earlier once in September which, however, was not very popular in the secondary market. The response to this second issue was a little more than half at Rs 1,017.07 crore with all applications being accepted and the balance of Rs 982.93 crore devolving on the RBI.

364-day Treasury Bills

The government raised Rs 49 50 crore through two auctions of 364-day TBs during November as against the total amount of Rs 59 50 crore bid (Table 4). The yield remained constant at 12.50 per cent (cut off price being static at Rs 88.50).

91-day Treasury Bills

A total amount of Rs 2 500 crore was raised through four auctions of 91-day TBs held during November and one auction held on December 1. The market bid for a total amount of Rs 1 321.24 crore in these five auctions. Of the notified amount, the devolvement on the RBI was more than half at Rs 1 280.02 crore and the share of competitive bids was a little over 30 per cent. At the unchanged cut off price of Rs 96.86, the yield remained constant at 12.97 per cent for all the five auctions (Table 5). Another significant observation was that there were a large number of bids received for small amounts. For instance, the auction of November 10 received 9 bids from the market but the total amount of these bids was only Rs 15.64 crore, giving a meagre average bid size of Rs 1.73 crore per bid.

PSU Bonds

With the first round of PSU divestment programme of the government ending in a near failure and the scarcity of funds forcing the PSUs to look at other options for raising funds, many a PSU was reported to have been taking the private placement route for their bonds. PSUs were also attracting investors with innovations. The Indian Railways Finance Corporation (IRFC) for instance, offered an upfront discount of Rs 50 in the issue price of its 10.5 per cent tax-free bonds with face value of Rs 1 000 at a price of Rs 950, effective return on these bonds working out to 11.05 per cent post-tax. IRFC plans to tap the market for another Rs 750 crore in mid-December. Krishna Bhagya Jala Nigam (KBJNL) offered the second series of 17.5 per cent bonds worth Rs 180 crore for private placement. It planned to offer another Rs 250 crore after the successful placement of this issue. SAIL was also in the market with an offering of Rs 300 crore, of which Rs 100 crore was through greenshoe option. Power Grid Corporation placed Rs 134 crore worth of its secured redeemable bonds at 16.5 per cent. Interestingly, the public sector Hindustan Zinc lent one-year corporate deposit of Rs 20 crore to Tourism Finance Corporation of India (TFCI) at 15.5 per cent – a full 7 per cent lower rate than the market. As a result, TFCI postponed its bond issue for some time.

Financial institutions such as HFC (Rs 200 crore) and ICICI (Rs 500 crore) were also in the market while IDBI (Rs 1 000 crore) and Bank of Baroda (Rs 300 crore) were planning to enter the market in December. HFC planned to approach the market for Rs 500 crore in

January. ICICI also offered Rs 1 000 crore repatriable bonds to non-resident Indians. The issue of redeemable bonds in the nature of promissory notes at par was aggregating Rs 500 crore with a right to retain oversubscription to the extent of Rs 500 crore. The annualised yield on these bonds was 16.64 per cent. HUDCO was also reported to be planning to come to the market with Rs 300 crore tax-free bonds and Rs 100 crore of normal bonds with attractive front-end discounts. The Indian Airlines was planning to float a bond or debenture issue of size Rs 500-600 crore.

Certificates of Deposits (CDs)

The sluggish growth of deposits and the near absence of liquidity in the market forced the banks to get themselves rated for CDs. This was also necessitated by a government directive which required the PSUs to invest only in the CDs of banks with a rating equivalent to P1+ or A+. Banks such as State Bank of India were earlier resisting the government directive and had approached the government to reconsider its stand. The stringency of the money market, however, forced them to abandon their stand and get themselves rated. Among the banks which got themselves rated were:

(Rs crore)	
Bank	Amount for which Rated
State Bank of India	5 000
Bank of India	1 400
Bank of Baroda	1 400
Vysa Bank	450
State Bank of Bikaner and Jaipur	250

This came on top of the outstanding CDs of approximately Rs 1 500 crore in mid-November. At that time, CD rates moved in the range of 15.5-16 per cent. The issuers then were mainly the financial institutions such as IDBI and ICICI. Towards the end of the month, however, when the State Bank of India planned to enter the CD market, it had to offer 17 per cent for three months, which meant a fierce competition with other banks reportedly offering 16.165 per cent. Among the PSUs which had funds to offer were NABARD, Gas Authority of India, Power Finance Corporation, Oil India and Maruti Udyog.

The CD market is expected to get further boost following the government's guideline on November 14, which stated that

“PSUs will not be allowed to invest their surplus funds in UII and other public and private mutual funds as they are equity based and are therefore inherently risky”. They can however put their surplus funds with banks which have net worth of Rs 100 crore as against the earlier stipulation of banks having paid up capital of Rs 100 crore. While such a policy prescription will have a dampening effect on secondary capital market as UII would sell equities to raise money to meet the repurchase of

units, this will provide necessary fillip towards the development of the CD market.

Inter Corporate Deposits (ICDs)

The inter corporate deposits market moved in tandem with the money market. The corporate sector, always, drew its cash credit limit to the hilt as the call rates soared and offered the funds back through the ICD market with a clean arbitrage benefit of 8 to 10 per cent. The rates in this market increased from 20.25 per cent to 23.28 per cent depending on the creditworthiness of the borrower. Reportedly, many corporate have begun withdrawing from the ICD market as it may turn out to be risky debt trap, as perceived by a large section of the manufacturing and finance companies. With no fresh money coming into the system, most of the earlier ICDs were rolled over in order to avoid defaults. The high interest rate regime also affected the bill discounting rates which hit the record level of 30 per cent.

Other Developments

Short term money market is likely to get some boost as the Singapore based Asia Limited has decided to introduce for the first time in India, rating, credit rating which will enable a lot of poorly graded companies to enhance their credit rating and float debt instruments at better rates. Asia Limited is a financial guarantee (FG) company that lends FG for infrastructure bonds and asset backed securitisation.

In another development, the banks have started disbursing bridge loans in the range of 19-23 per cent, after the Reserve Bank liberalised the bridge loan facilities.

IV Secondary Market

The turmoil in the money and foreign exchange markets dampened the secondary market for government securities and other debt instruments. The yields on government paper increased to as much as 16 per cent on account of virtual absence of sellers in the market. The actual traded size of dated government securities on the National Stock Exchange (NSE) continued to fall in November, it was Rs 270 crore in the four weeks ended November 24 as against Rs 292 crore in October and Rs 713 crore in September. The SGI account too recorded dated security deals (excluding repos) worth Rs 965 crore in November as against Rs 987 crore in the previous month and Rs 2 073 crore during September (Appendix Table).

Government Securities

The 12.75 per cent 1996 which was about the only short term security available in the market and it was naturally the most traded security during the month. It also fetched the highest yield of 16.23 per cent for some transactions or 16.09 per cent average

(-) means no trading. YTM = Yield to maturity in per cent per annum. CY = Current yield in per cent per annum. * Yield rates of these sub-groups of TBS and dated securities have been used for the graphs.

Notes: 1) Yields are weighted yields, weighted by the amounts of each transaction. 2) Current yield has not been worked out for treasury bills.

for all transactions in November, whereas other securities such as, 13.50 per cent 1997, 13.65 per cent 1998, 13.12 per cent and 12 per cent 1999, Zero Coupon Bond 2000, 12.50 per cent 2004 and 14 per cent 2005 (second issue) traded in small volumes in a close yield range of 13.50-14 per cent. 364-day Treasury bills were also actively traded in the yield range of 11.30-13.90 for maturities varying between December 1995 and August 1996.

On account of the extreme scarcity of funds in the money market, there was premium to short-term liquidity. As such, the yield curve for government securities was somewhat inverted during November and showed higher yield at the shorter end and the yield curve flattened towards medium and long-term (Graph E).

Other Instruments

A significant volume of Rs 79 crore was traded in commercial paper on the NSI

(Table 6). The CPs of Coats Viyella L&T, Arvind Mills and IL&FS were traded in the yield range of 15.75-16.25 per cent towards the first week of the month. The yield range increased to 17.50-18 per cent towards the month-end. PSU bonds and state government loans were also traded in small volumes.

[Paramita Debnath provided background reviews and V P Prashant statistical compilations and graphs for this note.]

Enron Renegotiations

Bungling by Government

Subodh Wagle

The government has bungled the entire renegotiation issue. Having promised transparency, it cannot now take unilateral decisions on the project. The only solution is to set up a quasi-judicial tribunal to go into all aspects of the project.

THE controversy over the Enron (Dabhol Power Company) power project in Maharashtra seems to be dying a silent death. Except for a few sceptics and local people fighting for their right to livelihood, everybody appears to be happy with the 'renegotiated' compromise and with the conclusion that wise counsels have prevailed on both the sides and the state of Maharashtra has been spared a great disaster. The sudden and mysterious occurrence of frequent breakdowns in electric supply in recent times in the state seems to have put the last nail on the controversy.

However, a little examination of events as well as of the facts that were leaked out is adequate to raise many doubts. As things stand today (December 7), there are four ongoing processes: the temporarily suspended arbitration proceedings in London initiated by the Enron Corporation, the suit filed by government of Maharashtra in Bombay High Court, the recently concluded renegotiations between Enron and the state government, and rejuvenated struggle by local people. The state government seems to have bungled on all four fronts.

Regarding the arbitration procedures, the threat of compensation of about Rs 1,000 crore to Enron is being used by all to bring back Enron. During the early phase of the controversy when the new state government announced its decision to rethink the Enron deal, many had suggested detailed plans to initiate urgent damage control measures which were aimed at reducing the burden of possible compensation. However, no action was taken on this count which has now resulted into high claims of compensation by Enron. Even during the arbitration proceedings, it is reported that the government failed to provide adequate support and necessary facilities to its own lawyers to the extent that they had to buy their own plane tickets. Secondly, if the government's affidavit in the high court is to be believed, the Enron company and its officials, in collusion with some government and MSI:B officials, have defrauded the state government and people of the state. In this situation, it

is a serious failure on the part of the government to enter into any dialogue with the accused company and its officials instead of initiating legal procedures and punitive actions against them.

Thirdly, the new government, which came into power on an anti-Enron plank, has treated people in the three affected villages in an extremely callous manner. Often the bureaucracy was given a free hand to break the struggle of the local people. The agitators, including women, were taken into custody, refused bail, and were incarcerated in distant jails. Now local people who are still agitating for scrapping of the project feel cheated, and are very bitter about the leaders who had offered all kinds of support to them before coming to power. This author, during his recent visit to the project site where local people were on hunger strike, had an opportunity to hear on the public address system an audio cassette of a speech by Gopinath Munde (March 6), the deputy chief minister, pledging his 'active' support to the struggle of local people to its very end.

Before going into the analysis of the renegotiation process largely focused on the economic issues of project cost and tariff, it must be noted that there are many other equally important issues and objections involved in the Enron controversy. These include environmental objections (both theoretical and practical), social issues rooted in displacement of local people, financial issues like foreign exchange burden, issues of national prestige (highlighted by the chief minister in his speech in the state legislative assembly announcing scrapping of the project), and the issue of increasing dependence on foreign fuel and national security (highlighted by Swadesh Jagaran Manch and Rambhau Mhalgi Prabodhini both from the Sanghparva). The government, now bent on bringing back Enron, seems to have pushed all these issues under the carpet.

Finally, the main accomplishment of the government, acclaimed by many, is its supposed success in reduction of the project cost and tariff. However, all the government's actions that led to the decisions of scrapping

the project and of renegotiating the deal were bungled, if not purposely subverted. First of all, proper and adequate spadework was not done before arriving at both the decisions. In their early memorandum to the new government, the author and his colleagues had requested the government to appoint an expert panel to go into the details of the agreement and its various (especially technical, economic and legal) implications before arriving at any decision. But the government appointed a cabinet subcommittee and announced its decision mainly on the grounds of political expediency and, as admitted later, without adequate investigation of the legal and other implications. This led the government into the hopeless morass of arbitration procedures.

Both the process by which the government arrived at the decision to renegotiate the deal and the rationale as well as manner in which renegotiations were carried out are mysterious. As mentioned earlier, it simply pushed under the carpet all objections and issues other than those of project cost and tariff. Neither did it give serious thought to the host of suggestions for alternative courses of action. The state governments of Kerala and Karnataka have already taken steps which this author and his colleagues had suggested as a component of the short term alternative. Kerala and Karnataka are going to add between 400 to 800 MW (the first phase of Enron is only 700 MW) through private diesel based generation. This capacity addition will be at a cost which is competitive with the reported renegotiated cost of Enron and will be achieved in a very short period compared to the Enron project.

After the decision to renegotiate, the government appointed a committee of experts. There has been quite some confusion over the terms of reference of the committee and its status. Though the terms of reference were never announced explicitly despite persistent queries from media, as it turned out later, it was an advisory committee which directly negotiated with Enron officials on behalf of the government. Now the government is going to announce its decision on the basis of the recommendations of the committee. It is worthwhile to look into the composition of such a powerful committee appointed by the government. All the six members of the committee are either bureaucrats, technocrats or mainstream economists who, because of their training and beliefs, are naturally sympathetic to the cause of privatisation and projects like Enron. Interestingly, the government did not appoint any independent expert capable of and interested in taking a critical look at the implications of the project in order to safeguard interests of consumers, of local people, and people

of Maharashtra at large. Neither did it appoint any representative of consumer, trade, or local people's organisations which were opposing the project.

'ACCOMPLISHMENTS' OF RENEGOTIATION

There is nothing to rejoice in the outcome of the renegotiation process. *The Times of India* and *The Economic Times* have quoted various numbers in their editorials congratulating the government. But there are many ambiguities and contradictions in the published numbers. The government is being praised for three 'accomplishments': (a) shift to a new fuel (naphtha), (b) equity participation of MSEB, and (c) reduction in project cost and electricity tariff. A brief analysis of all these three would help dispel the euphoria that has been generated.

First of all, regarding the use of naphtha as fuel, there is nothing new in this proposal as Enron was ready to shift to naphtha even before the project was scrapped. Further, shift to naphtha would imply that this is an entirely new project in many aspects and would require fresh assessment by government environmental, financial, and other agencies like MoEF, CEA, and FIPB. Similarly, there is nothing entirely new in the offer of equity participation which Enron had made before scrapping of the project, and which MSEB had rejected mainly on financial grounds. Apart from the financial difficulties, there are some legal problems in the participation of MSEB in private power projects as an equity partner. MSEB can certainly nominate other parties. However, considering the past experience, transparency and fairness in nomination process seems to be doubtful.

Coming to the third accomplishment of reduction in cost and tariff, as far as capital cost is concerned, it is reported that it has been reduced by about \$ 375 million (about Rs 1,200 crore). However, according to the same analysts, it should be possible to further reduce the project cost by another \$ 200 to 250 million (about Rs 650 to 800 crore). The renegotiated cost of electricity is cited as Rs. 1.90 per kwh. In this regard it must be noted that the earlier government and supporters of Enron deal had similarly harped on the figure of Rs. 2.40 per kwh, whereas my colleagues and I have demonstrated (*EPW*, June 17) that the actual levelised cost then was between Rs 3.44 and Rs 4.68 per kwh depending upon the assumptions. In this case also it is not clear whether the new unit cost of electricity is the levelised cost, and, if so, what the underlying assumptions are.

Apart from the cost and tariff, there are other equally important economic issues about which there is a lot of confusion. It is not clear whether 90 per cent PLF is guaranteed or the capacity charge is calculated on the basis of 90 per cent availability. With the increased plant capacity, 80 per cent PLF will be equivalent to the 90 per cent PLF

for the previous plant capacity. Hence, with the increased plant capacity in the renegotiated deal, 80 per cent PLF is adequate for making LNG a viable fuel. However, as Enron is allowed to sell the gas to third parties, the guaranteed PLF value should be much lower (which would, to some extent, reduce unnecessary backing-down of MSEB plants and its resultant losses). Secondly, the extremely skewed sharing of the risk burden and issue of penalties and guarantees in the original power purchase agreement (PPA) were among the main points of discussion earlier. Information on sharing of the risk-burden and details of guarantees and penalties for time and cost overruns as well as fuel supply risks in the new agreement needs to be analysed for evaluating the claims of reduction in project cost and tariff.

The renegotiations seem to have damaged the cause of people of Maharashtra instead of benefiting them. First of all, the new government has failed to pressurise Enron to discontinue the arbitration procedures in London which is a serious affront to the prestige and sovereignty of this nation. Secondly, the government has given up the right to cancel the second phase and instead has accepted it, which is going to be extremely harmful to the interests of the nation in the long term. In fact, the government has thoroughly bungled the renegotiations, and, as a result, the post-renegotiation situation appears to be far worse than the pre-scrapping situation wherein the government then had an opportunity to bring down the cost of the first phase without committing to the second phase. In short, it is not clear whether the people of Maharashtra have gained anything in the process of renegotiations, but it is certain that they have suffered not just economic loss but even a loss of prestige and sovereignty.

In light of this, in the first place, the state government should desist from making any unilateral decision on this issue without taking the people and their organisations into confidence. Secondly, other important issues should also be brought into discussion and consideration. For example, the environmental implications of naphtha, the new fuel for the first phase, need to be investigated in detail and in a very transparent manner. Relevant information to evaluate environmental implications needs to be made public. It is reported that the environmental implications of naphtha depend upon the geographic location of the naphtha source. Thus, information on the source and composition of naphtha to be used throughout the first phase needs to be made public.

Thirdly, and most importantly, the final decision should be arrived at in a democratic and transparent manner to which this government had pledged itself. The reported statement made by LK Advani in this respect is very unfortunate. It is sad that local people, consumers, independent experts, and

organisations like Swadeshi Jagaran Manch are not included in Advani's list of people who should be taken into confidence before making any decision in this regard. There are well-accepted definitions and procedures to ensure transparency in decision-making by governments even in this country in order to avoid autocratic, quixotic, or capricious decisions based on whims of individuals at constitutional and extra-constitutional centres of power.

The state government has proved itself incapable of handling this vexed issue on its own. So there is only one way left to ensure transparency necessary to safeguard the interests of the people of Maharashtra. It is to resort to the somewhat time-consuming but time-tested institution of a quasi-judicial tribunal or commission with proper terms of reference covering not just techno-economic but all other issues and objections in this regard. These should include: environmental objections (both theoretical and practical), social issues rooted in displacement of local people, financial issues like foreign exchange burden, issues of national prestige, the issue of increasing dependence on foreign fuel, and the issue of national security. A panel of independent experts chosen from the names suggested by all the parties involved should be constituted to help and advise the tribunal (like the Jayant Patil Committee appointed to look into the disputed Sardar Sarovar project).

As far as procedure is concerned, Enron Corporation and the state government should present their proposals and other parties would make their representations commenting on the government proposals and presenting their own alternative proposals. The procedure requires that all the relevant information and details are made available to all the parties involved (this includes all the details of various agreements including the new power purchase agreement as well as all relevant reports like environmental impact assessment.); the representatives of various organisations and local people opposing the project are given sufficient time to react to the government proposals and present their own proposals; and thirdly, the government advisors and officials as well as the proponents of alternative proposals are made to answer the queries raised by all concerned. The decision of the tribunal should be binding on all the parties involved.

To sum up, the new government which has repeatedly promised transparency in decision-making has no right to announce a unilateral decision on the Enron deal without taking into confidence local people and consumer, trade, and other organisations which have been opposing the project. This becomes more important especially after the thorough mismanagement of the entire issue by the government. Hence, the state government should hand over the responsibility of arriving at a final decision to a quasi-judicial tribunal.

Let Indian Muslims Not Repeat the Mistake

Asghar Ali Engineer

The leaders of Muslim Personal Law Board, on the election eve, are again indulging in fanning communal passions and aiding communal politics in the country

RECENTLY there was an ad in an Urdu paper from Bombay inserted by All India Muslim Personal Law Board (MPLB) which appeals to the imams of the mosques that they should explain to the Muslims the significance of shari'ah and its protection. The MPLB further appeals the imams to explain that entering Islam has to be complete which means accepting shari'ah in toto. Islam, the ad goes on to say, is a complete way of life and it guides us in every walk of life including our business, service, obedience to the parents, education of children, etc.

The ad adds that now there is an attempt to take all decisions in matters of marriage, divorce, etc. according to the Hindu code rather than the Islamic law. It calls upon the Muslims not to go to courts which decide cases in un-Islamic ways and never accept common civil code.

Apparently this ad seems quite innocuous but there are deeper implications which can have much wider ramifications in Indian politics. The MPLB is also observing a week during which meetings will be conducted throughout India for protection of Islamic shari'ah. The leaders of MPLB and other Muslim leaders will address these meetings.

Before proceeding further I would like to state here that I am not in favour of common civil code (CCC) as the whole issue has been communalised. It is not to empower women but to get votes of this or that community that various political parties are supporting or rejecting it. Moreover CCC is not a solution even if it is not politicised. Indian realities, both social as well as political, have to be taken into account in accepting or rejecting CCC. Indian society is far from ripe as far as CCC is concerned. What is instead needed is to reform Muslim personal law or other personal laws to make them more equitable and just for women.

MPLB's opposition to CCC is quite understandable but what is objectionable is the methods it is adopting. The Muslim leaders, many of whom have lost their appeal in the wake of demolition of Babri masjid and the riots following it, are again trying to use this opportunity to build up their image by playing with emotions of Muslim masses. It is the same old game they have been playing since independence. This is how they had built up the Shah Bano

movement. Then they had used mosques to frighten Muslims by telling them that if they do not fight these mosques will be locked hereafter and there will be no trace of Islam in India. The innocent masses were misled, and genuinely responded. Millions of Muslims were thus made to protest against the Supreme Court judgment in the Shah Bano case which not only legitimised Hindu communalism but also strengthened Hinduva forces. Ram Janmabhoomi issue also got new lease of life because of Shah Bano movement and India faces communal crisis it had never faced since independence.

It is unfortunate that those very Muslim leaders are playing the same game again. They have found another issue to refurbish their image. The Muslim intelligentsia must see to it that the Muslim masses are not made to go through the painful experience once again. The safety and security of Muslim masses lies in strengthening democratic and secular forces. Lot of secular political space is available to Muslims to protect their rights and their religious identity. No secular party be it the Congress, the Janata Dal, the Samajwadi party or the communists is in favour of enforcing CCC against the wishes of Muslims, and these parties have already made it abundantly known. Then where is the need for such an agitation which will only strengthen the hands of communal forces and deliver more votes to them? That in turn will make possibility of CCC being enforced against the wishes of minorities more realisable. Whose interests then these Muslim leaders are serving?

It should also be understood that in a secular democratic India one cannot stem the tide of personal law reforms for long. Women cannot be subjugated for ever. Islamic principles as propounded in the Qur'an are quite just and in favour of empowering women. However in various ways provisions like *talaq-e-thalatha* (triple divorce) were introduced to retain male superiority. Triple divorce has been highly controversial throughout Islamic history and there never was unanimity on it among the Muslims. To defend it as divine law to say the least, is to give Islam a bad name and misuse the concept of divine to perpetrate male domination.

These Muslim leaders have never made any sincere attempt to stop malpractices among the Muslims. Triple divorce is widely

misused to harass women, and has practically become the only way of divorce, though it is considered as sinful form of divorce. Yet, no concerted movement has ever been launched by these leaders to check this misuse. They do not even think for a moment that how a *bid'ah* (sin) can be defended as a divine law. If they really care for Allah's commandment as unalterable why do they not implement the Qur'anic injunction in the verse (4:35) which clearly lays down arbitration before divorce? It is such a fair and clearly expounded provision for women. Yet no Muslim theologian insists on following it in the event of divorce.

If the Qur'anic injunctions are followed scrupulously Muslim women will be greatly benefited and empowered. The Ulama and Muslim leaders who talk of divine shari'ah being immutable kept quiet when the British rulers deprived Muslim women of their right in agricultural property. It was in total violation of shari'ah provision. Thus it will be seen that opposition to CCC on the part of Muslim leaders is a political and not a religious act.

Also the practice of dowry is widely prevalent among Muslims. Earlier there were no instances of bride burning among Muslims. Now so many cases are reported from time to time in Urdu media. Yet the MPLB does nothing beyond passing resolution once in a while. No sustained movement is launched against it. Some Muslim women in Bombay had taken initiative to devise a *nikahnama* stipulating conditions protecting legitimate and Islamic rights of women. It was forwarded to MPLB to enforce it in the interests of women. It is now learnt that MPLB is likely to give its approval to it in rather watered down form. It is reluctant to agree to *talaq-i-tafwiz* (delegated right to divorce) which is an empowering provision of shari'ah.

The MPLB indulges in Islamic rhetoric but does next to nothing to infuse Islamic spirit. More it indulges in Islamic rhetoric, more the rights of Muslim women are threatened. It organises strong protests whenever privileges of men are in danger. It has also not educated the common Muslims that polygamy was permitted by the Qur'an to help widows and orphans, and that too with full sense of justice to all the wives. In fact Islam encourages monogamy and discourages polygamy. The holy Prophet had specifically prohibited his son-in-law Ali to take second wife while his daughter Fatima was alive. The MPLB leaders keep quiet even when some non-Muslims convert to Islam to take second wife which amounts to gross misuse of Islamic laws. The recent judgment by the Supreme Court asking the government of India to specify its position about uniform civil code was delivered when petition was filed by the aggrieved Hindu wives against such misuse of Islamic laws. Had the MPLB leaders protested against such misuse and

appealed to Qadis not to solemnise such marriage; it would have had very mollifying effect on non-Muslim.

The MPLB leader is kept quiet for a couple of months after the Supreme Court judgment was delivered. And now, when elections are drawing near, they have suddenly woken up and are using threatening language. Some of the speakers in the meeting organised by the MPLB in Bombay on December 2, 1995 even declared jihad for protection of shari'ah. This will provide grist to the BJP propaganda mill. They will in turn declare jihad against Muslim personal law. So far the BJP propaganda about uniform civil code has been in the low key. They are undoubtedly going to include it in their manifesto. But since they are also aiming at the Muslim vote (they have already given the slogan of *talim, tarbiyat* and *inayat* for education, training and commerce for Muslims) they may not raise the issue of CCC in a strident manner. It may be raised just to satisfy their Hindutva brigade.

In fact, in democracy one must know how to manipulate various vote-seekers as the vote-seekers do not try to manipulate voters. This creates a great deal of political space which intelligent voters (or community of voters) can exploit to their benefit. However, the Muslim leaders have never learnt this art. They know only one crude method to arouse the emotional pitch of Muslims and then pay back the price by endangering their security.

That the political parties pander the voters in general and Muslims in particular is proved by the fact that they suddenly become concerned with the welfare of those groups and communities whose votes they seek. For example, Indira Gandhi had drawn up a 15-point programme for minorities which was also endorsed by Rajiv Gandhi government. However, for all these years no one among high and mighty even knew what this programme is. A survey conducted by Institute of Islamic Studies, Bombay, about the implementation of 15-point programme in Delhi (under the very nose of the central government) and in Uttar Pradesh drew completely blank. The officers in charge either gave evasive replies or avoided meeting our representatives. But now suddenly it has been rediscovered by the Congress government and a high-powered committee has been set up under the chairmanship of Prashant Mukerji to supervise the implementation of the 15-point programme. Similarly, earlier in 1980, Indira Gandhi government had appointed Gopal Singh Committee to make recommendations for the welfare of minorities and SCs and STs. Gopal Singh, being a man of integrity and commitment, worked hard, did thorough research and made excellent recommendations after collecting data scrupulously. The recommendations were, however, ignored

and shelved. The Muslim community have benefited a great deal if the Gopal Singh committee report had been sincerely implemented.

The Muslim leaders themselves never bothered about the report. They were busy with the Babri masjid issue which was highly emotional and could make them 'great leaders' overnight. In fact, they never had the welfare of the Muslims at their heart.

political bargains.

Today, even BJP is trying to court Muslim votes. If the Muslim leaders had been concerned with the betterment of Muslim lot, they would have intelligently used the new political space for their benefit. But that is remotest from their heart. Old addicts as they are, they are playing the same game.

Forest Management and Survival Needs

Community Experience in West Bengal

Neela Mukherjee

Sustained community participation in joint forest management projects is possible only if the survival needs of the poor have been met beforehand

IN June 1995, we visited a tribal area of West Bengal to study the status of developmental interventions and their impact on the local people. This was part of panel data generation through Participatory Rural Appraisal (PRA) since 1991 on poverty and well-being of tribals. The sample village Krishna Rakshit Chak has large number of poor landless labourers. The tribals in the area are engaged amongst other activities in Joint Forest Management (JFM) for protection of local forests. Recently, with large-scale illicit felling of trees, such effort suffered a big setback. Large tracts of such felling were clearly visible from the approach road. Krishna Rakshit Chak is being visited every two years starting from the year 1991. During the current visit, villagers appraised about the conditions prevailing in and around the village. The issue of JFM was brought up as an issue for immediate discussion by different groups of villagers during the course of interaction with them.

JFM is a novel experiment in protection of forests by local communities in collaboration with the forest department. Such management is crucial because forests, which play a critical role in balancing the global ecosystem, are under increasing threat from anthropogenic forces. Participatory management strategies in protecting forests for meeting local needs and also for preservation/conservation of bio-diversity are increasingly gaining attention in many countries of the world. The success of Arabari experiment in JFM in Midnapore district of West Bengal is well known. However, ironically, in the same district JFM of Arjuni mouza failed to deliver results.

The objectives of social forestry under JFM can be broadly summed up as follows:

- (a) to reduce pressure on natural forests
- (b) to involve indigenous people depending on forests for their subsistence needs in planning, development, exploitation and protection of forests and thereby
- (c) to preserve/conservate bio-diversity by means of people's participation.

The plantation under JFM in Arjuni was around 76 hectares as per the local forest department while it was around 200 hectares as per the villagers. The Arjuni forest protection committee formed in 1991 was entrusted to look after the plantation for five years as per the agreement, the official felling year being 1996. This is because the forest protection committee, according to the JFM agreement, becomes eligible to get its share of 25 per cent timber only when they protect the forest for a period of five years.

The villagers described the different species which were under plantation in the JFM area. They brought leaves of many such species from local trees in the village to describe them. Selected species under JFM at Arjuni were as in table.

Name	Use
gumar	fodder and timber
cashew	fruit tree
eucalyptus	fodder (when small), firewood and timber
akashmoni	fodder, firewood and timber
sahabul	fodder, firewood and timber
sirish	firewood and timber
patash	firewood and timber
manjari	firewood and timber

ILLEGAL FELLING

The members of the Arjuni forest protection committee went from door-to-

door to request people to protect forests. They guarded the forest with great zeal and enthusiasm. Whenever they heard any noise in the forest or saw some disturbance they ran to protect the forest and brought such incidents to the notice of the forest department. This continued from 1991 to the middle of 1994 when the forest protection committee was effective in protecting the forest.

According to the villagers, the local forest administration was generally relaxed since the foresters thought that people had accepted responsibility for protection of forests under the JFM agreement. However, since mid-August 1994, the forest recorded a large number of illicit felling. The felling became so rampant that it could not be stopped until all timber trees near inhabited areas surrounding the forest were felled. The protection committee at the beginning caught several thieves but after a few days the number was much bigger than what they could handle. Many were caught and fined but the spate of felling continued unabated and the Arjuni forest protection committee became virtually ineffective. Amongst the offenders, some surrendered, some ran away while some others threatened the local guards with dire consequences.

The price of timber fell as a result of mass illicit felling and the timber was sold at a cheaper rate due to a glut in the local market. Villagers were themselves involved in the felling. The breakdown of the JFM was a blow to its credibility.

Seeing the mass loot of the forest (a term used by the villagers) the panchayat of Arjuni decided to quickly fell its plantation under social forestry for Rs 11 00 000. Such a hasty decision was intended to be pre-emptive i.e. to stop illegal felling in JFM areas from spreading to the plantation by the panchayat. The panchayat had done parallel plantation on the banks of a local canal. With rapid disappearance of trees under the social forestry adjacent to JFM, the panchayat decided to fell other areas of plantation under the social forestry scheme and reap benefit at the earliest.

In the middle of 1995, the felling was finally arrested. Two basic reasons are offered by different groups of villagers. (1) One immediate factor was that the contractors who were now felling trees under the social forestry programme of the panchayat were alert and kept an all round vigil in the area concerned. (2) Some plantation of JFM (less than 25 per cent) still remained. It was far away from the villages and hence was not easily accessible.

DIFFERING VIEWPOINTS

Villagers, some of whom were active members of the Arjuni forest protection committee formed in 1991, and who foresaw dangers to the plantation under JFM with recurrent incidents of illicit felling

communicated with the forest department in October-November 1994. They suggested immediate arrangements to be made by the department for felling and sale of forest timber under the JFM. According to them, the felling of trees under JFM was unnecessarily delayed by the forest department given the timber content of the forest and its valuation. The villagers were not worried about the five-year period of the agreement for protection of the forest. They were more worried about the dangers of illicit felling which was imminent and threatened the very existence of the plantation. These villagers realised that the forest committee would be of limited use in preventing such illicit felling. However, the forest department was unable to come out with any immediate solution.

One major reason repeatedly pointed out by a group of villagers for the felling was the seasonal livelihood and food insecurity which plagued the area and led to conditions of semi-starvation amongst the poor people. For two three years the JFM worked well. Last year in the Bengali month of 'bhadra' (August-September) food shortage reached peak. This was due to fall in employment opportunities for poor people. Some of them took recourse to illicit felling of trees and sold them in the local markets for Rs 20-25 per tree.

The forest department representative though aware of what was happening was unable to deviate from the agreement with local communities. The department could not arrange for immediate felling of trees in the latter half of 1994 as requested by many villagers because the five-year period of the agreement was still to be completed. As per the agreement, the beneficiary community was not entitled to the long-term benefits of JFM before the five-year period.

According to the representative, the JFM was problematic in areas closer to towns (not all villages in Arjuni are close to town), since illicit felling and selling of trees became much easier. He also alleged that the protection committee had members who tacitly encouraged such illicit felling. The local offenders when caught were protected by members of the forest protection committee out of local political patronage, kinship, etc.

The problem was aggravated due to two cases of theft in which differential fines were imposed on the culprits caught for felling trees. The incident aroused adverse local reactions and was interpreted as political favouritism. This triggered felling of trees on a large scale which were sold in the local markets. The protection committee also became relatively inactive with differences cropping up amongst its members.

The reason offered by the forest department, such as nearness to markets and political favouritism failed to account for the years prior to 1994 when the JFM agreement was strictly honoured by the

community. Even if it is assumed that there was some tacit support of the governing body for such illicit felling, the question still remains as to what was the underlying cause and who gained how much.

Going by the food calendar of the region from 'harsakh' (mid April to mid May) to 'srahon' (mid-July to mid August) the poor people work hard and save little for the difficult months to follow. In 'srahon' there is greater availability of work due to buoyant farming activities. The worst part is from 'bhadra' to 'kartik' (mid August to mid-November) when no agricultural or other work is available except for catching fish and selling it in local markets. Such livelihood strategy is quite uncertain and risky since opportunities for catching fish were not available on a daily basis and such catch and its price differ from time to time. Villagers pointed out that by mid-August insecurity of food and livelihood was relatively acute as compared to other years. Some people who were at the brink of starvation resorted to illicit felling of trees and sold them in the local markets for meagre amounts.

The food calendar indicated that whereas work was available for the poor in 'agrahyan' (mid November to mid-December) in near by villages when both men and women found employment the month to follow 'poush' (mid December to mid January) only provided work to men. The poor households did some savings in the months of 'agrahyan' and 'poush' and bought corn at cheaper prices to store it for the difficult months which followed. In 'magh' (mid January to mid February) the poor caught fish and sold them as a livelihood while in 'phalgun' (mid-February to mid March) they sold firewood and were able to earn a meagre living. However, in 'chaitra' (mid March to mid-April) life became more difficult when income earning opportunities were practically nil and hence purchasing power for food was in short supply.

The question still remains as to why the forest remained intact prior to mid 1994. The answer lay in the locally grown wild food which provided a safety net to the poor people in the difficult months. Earlier, wild food was freely available from farms and other common property resources (CPRs). Free access to such food dwindled since 1994 leading to increase in food insecurity. The wild food was sold in the local market by the farmers, to protect their real income against rising food prices. The following were market prices of some items:

Items	Local Price
susni sak	Rs 6 /kg
kalmi sak	Rs 1/3 small bundles
gima sak	Rs 2/kg
thankuni sak	Rs 10/kg (dried ones more expensive)
nate sak	Rs 3.50/kg

(snails were also sold)

Further with degradation of CPRs, availability of wild food shrunk to a large extent. Rural women who were the primary gatherers of food were forced to walk long distances for the same. With shrinking supply of wild food their capacity to hedge against food insecurity of their households was enormously strained. Hence poor people in that area were either forced to reduce their consumption of wild food or buying them (or their substitutes) from the market by generating additional income. However, livelihood opportunities also declined. Hence, survival needs became of utmost importance. As an alternative to starvation, many resorted to contingency sale of JFM plantation to feed themselves.

The failure of JFM resulted in depletion of local forests which forced women to go to other forests for fuelwood. The forest protection committees of those forests posed a major hindrance. Hence women faced great difficulty in procuring minor forest produce for their day-to-day existence. Also, the protection committee lost its share of 25 per cent timber entitlement under JFM. The village protection committee which looked after the forest for more than three years lost its entitlement to community benefits. Most importantly it lost credibility.

IMPLICATIONS FOR POLICY

JFM does not operate in a vacuum. It is influenced by local socio-economic, political, cultural and ecological variables in the areas concerned. If these forces are not reckoned with then a 'blueprint' for participatory management of natural resources remains naive and becomes unsustainable in the long run. The cross-currents of such variables can make or mar community participation and it is important to recognise the major forces so as to take steps to integrate them into JFM or minimise their distortionary influence over time. Again, the communities concerned are the best judge of such factors and it is they who can be approached for evolving locally viable strategies for community participation.

The survival needs of poor communities need to be recognised on a priority-basis as pillars for strengthening community participation. In depressed areas with higher levels of poverty, day-to-day existence comes topmost on their agenda. The most urgent community need at Arjuni is that of alternative means of livelihood during lean seasons with agriculture being the mainstay in peak seasons. Unless survival needs of food and livelihood are met, participation for natural resource management would always remain threatened. Of what use is timber benefits to a community, many of whom are trapped in subsistence living.

The meetings of forest protection

committees and forest department have become a ritual. The villagers of Krishna Rakshit Chak exclaimed that there were too many meetings with too little outcome. It is important to look back on the results of the numerous meetings and think of ways to make them more effective since the number of meetings does not ensure the sustainability of JFM. Moreover, the roles of forest department and village communities require clarification and may need to be re-defined so that forest protection becomes more effective. There can be several groups within the same community and it is important to recognise their identities for they influence community decision-making and the quality of protection. At present, it often happens that everyone's responsibility becomes no one's responsibility.

Charges of nepotism, favouritism also need to be seriously addressed. Credibility of the people in the protection committee and of forest department is important. It is necessary to look into the checks and balances in the system to minimise nepotism and favouritism. Questions of legitimacy of protection committee have also been raised by the villagers. This calls for further empowerment of protection committee.

The seasonal protection of forests needs to be intensified in consultation with villagers, especially during lean seasons. Protection can become more effective with seasonal strategies to support livelihood, income and food. At present, women's participation is negligible. It needs to be increased since, as shown by the Arjuni experience, women become the worst sufferers when JFM failed.

One lesson which comes directly from the Arjuni experience is that greater scope for flexibility needs to be created in the memo-randum of understanding. For instance, decision for felling of trees under JFM in Arjuni could have been hastened when responsible members of the local community sensed danger to JFM. Just because the period of the agreement was not over, such official felling was ruled out. Inflexible rules came in the way of jointly managed natural resources whose timber harvest could have been immediately marketed with profit to the community and the department.

Speedy replication of JFM without proper nurturing of community participation and institution building is open to all kinds of problems. Many local people were not convinced about the benefits of JFM. They expressed that there was not really any ownership of natural resources involved nor payment for protection done from day-to-day. Effective communication, dialoguing and sensitising of both forest department and people are important. More thoughts are required on ways of community building since weak and fragile institutions can play havoc with the future

of JFM. Long term gains hardly matter people who are facing major problems livelihood – food insecurity. The present JFM model needs to be re-modelled in terms of livelihood benefits which are immediate and less commercial.

If JFM as a strategy becomes difficult to be replicated it is important that intensive soul-searching to rectify some of its flaws/limitations be done. Participation by communities for material incentives has major limitations because it takes place after important decision have been made. Rules and laws have already been framed by the collaborator/agency concerned. What is so great about receiving 25 per cent of timber harvest? Is that acceptable to the local community or just another case of imposition by the forest department? Does it compensate for them on a day-to-day basis? Should the sharing of returns be made more attractive? If so, what are those ways? Should there be more community participation in decision-making? What about gender issues? These and other questions need to be sorted out. For this interaction with the community is of utmost importance for it has many positive ideas and has major stake in protection of natural resources.

Community participation in large groups is seldom automatic. Most often it requires initiation and a process of nurturing. It is important to take stock of whether the facilitators in the forest department have enough skills for motivating local people and likewise for institution building at the local level. The deficiencies in such interventions need to be identified and appropriate measures to tackle them are to be devised. Facilitating community participation is not an easy job. It requires community-friendly attitudes, tact, training, broad vision and years of field learning with different communities.

It is common to suppress failure stories in community participation. Many development workers feel depressed. Some even give up visiting those communities/sites, accepting them as problematic communities/areas not able to or willing to respond to participatory interventions. Such reactions need to be avoided.

The Arjuni experience in JFM goes a long way to show that survival needs are of prime importance and can easily destabilise community rights and benefits to resource management. Any JFM which does not recognise the significance of creating strategies for sustaining livelihood – food security – at the local level has a doubtful future.

[Thanks are due to villagers of Krishna Rakshit Chak, the forest department of Kalaikunda district administration, Midnapore, and S T S Lepcha and Abhijit Ghosh for their views.]

'Invisible' Workers Reach International Heights

Renana Jhabvala

The growing phenomenon of home-based workers has forced the International Labour Organisation to call for a convention for Homeworkers, the first meeting of which was held recently

ALTHOUGH there is a great deal of lip-service paid to the plight of unorganised sector workers, very little is actually done for them. It is extremely difficult to organise these workers, and those organisations that have, against all odds, come up usually can operate only at the local or state level, rarely possessing enough clout to ensure the enforcement of National Laws to protect these workers. The Construction Workers Protection Bill, for example, has still not been enacted by parliament in spite of countrywide agitations by construction workers and repeated assurances by the concerned minister. The Agriculture Workers Act has met a similar fate in spite of the strong recommendations of the National Commission on Rural Labour. There has been no progress on the Home-based Workers Protection and Welfare Bill, which was introduced in parliament as a private member's bill in 1989 and withdrawn on the assurance of the minister that it would actually be brought in as a government bill.

Home-based workers, 80 per cent of whom are women, are the most 'invisible' of all unorganised sector workers, as they work in the privacy of their own homes. Yet their invisibility has in some ways contributed to the internationalising of the issue. Since they can be exploited easily, home-based workers exist and remain unorganised in most countries of the world, including the richest ones. And in most ways the difficulties of these workers remain the same, whether they sew garments in England, make toys in New York, weave silk in Thailand or roll bidis in India.

Home-based work is found in many different forms in countries of the south and north, in both urban and rural areas. Traditional handicrafts work has often been carried out in the home, and piece-rate homework is also part of the most modern patterns of production associated with decentralisation of production and a growth in the sub-level. The worldwide increase in homework has to be understood in the context of a growing demand for a flexible labour force. Piece-rate home-work is on the increase in both north and south in a range of industries: textiles and clothing, a variety of

packing and assembly work, paper and printing, engineering, electrical and electronics, leatherwork, etc. Homeworkers, mainly women, often work 'for a small, local sub-contractor, part of a chain leading to major transnational companies, for example, garment retailers or brand names, car producers or electronics companies. In countries of the south, the growth in this form of homework is associated with the drive for increased exports. Much traditional crafts work done at home is also carried out under a putting-out system whereby the home-based worker is supplied with the materials and designs and is paid for her labour without taking in marketing or sharing in the profits of the business. Examples of this type of work are knitting or weaving in the north and basket-making and weaving in the south.

In most countries of the south, the piece-rate homeworker exists along with small producers or own-account workers. Often as a small producer loses control over her market or raw material, she becomes a piece-rate worker. The own-account worker is rarely much better off, as he usually has to buy the raw materials from a contractor and sell the finished product in a monopoly market. The own-account worker faces competition for bigger, more powerful business and has less access to credit, workplace and markets. Food-processing and weaving are two examples of own-account workers whose status as small independent producers is being undermined and who are gradually losing control over their markets. In the rural sector, home-based work is usually seasonal and is often associated with other types of agricultural and manual work. This kind of work includes processing of agricultural or forest produce, packing and cleaning of fruit and vegetables and the processing of fish products.

Home-based work includes a wide variety of work and work relations. It is difficult to separate the workers into employees or self-employed, as these distinctions are too rigid to cover the range of work relations that exist in the home-based system. Most home-based workers earn very low incomes. The piece-rates they receive are usually much

lower than the legal minimum wage (where it exists). If they have to buy the raw material and sell the finished product, the margins they receive barely cover the cost of their labour. Most surveys show that home-based workers earn incomes lower than other workers. Their work too is uncertain and irregular, depending on the vagaries of the market, on the weather, on the needs of a contractor or the availability of raw materials.

For the home-based worker, her home is her workplace. Her house is usually small, with no proper lighting or ventilation. Her work tools are rudimentary, causing strain leading to several health problems. Since the raw materials or components for her work are all in the house, her children are often exposed to noxious substances such as tobacco, glue and paints. She has generally no legal protection and few employment rights and has to take whatever income she gets. Her access to markets and credit are limited and so she has little prospect of improving her situation. She has no social security, for example, health services, insurance, childcare or housing and usually has to pay high market rates for these services.

ORIGIN

Home-based work is a growing worldwide phenomenon and since last 15 years many different women's groups have been trying to organise them. The Self-Employed Women's Association (SEWA) has been organising home-based workers in India for 20 years. SEWA members include the small artisans like weavers and carpenters and piece-rate workers like garment and bidi workers. SEWA is a union of 1,43,000 members and sponsors co-operatives of its members to produce alternative employment. So far it has 63 co-operatives including a co-operative bank and co-operatives providing social protection like healthcare, childcare and housing to its members.

In 1988, the International Labour Organisation (ILO) began a programme on home-based work in three countries of south-east Asia, with the support of DANIDA. A number of grass roots projects have been developed, including PATAMABA, the homeworkers' network in the Philippines, and HomeNet, a network of 32 women's craft groups, based in Chiangmai in the north of Thailand. Other projects are developing in Indonesia and other parts of Thailand, including work with urban piece-rate home-workers. In Cote d'Ivoire, the National Union of Informal Sector Women (SYNAFSI) affiliated to the national centre Dignité organises home-based workers including food processors. With assistance from SEWA, a self-employed Women's

Union has been recently launched in South Africa. In Europe, projects on homework have been active since the 1970s in the UK and the Netherlands. More recently, a working group on Homeworking was organised by the European Commission and a European Co-ordinating Group is being formed. Other developments in industrialised countries include a three-year campaign to organise outworkers (homeworkers) in Australia and several initiatives in Japan. In Canada, the Ontario District of the International Ladies Garment Workers Union has set up an association for homeworkers and is working with a broad coalition of other organisations to lobby for improvement of pay and conditions. The international trade union movement too has been paying more attention to home-based workers. In 1988, the International Confederation of Free Trade Unions (ICFTUs) passed a resolution calling on all concerned groups to help organise as did the International Food Workers (IUF) and the International Garment and Leather Workers Federation (ITGLWF). The ILO then held a tripartite Experts' Meeting in 1990 to discuss the issue of homework.

Grass roots organisations have realised that the growth of homeworking is an international phenomenon and if the homeworkers have to be organised and protected it would have to be at an international level. Some links have already been forged between projects in different countries, sometimes in regional or international meetings and sometimes through delegations, bilateral exchanges or meetings among homeworkers. Such meetings have also established the need for co-ordinated advocacy and research at the international level. For example, in 1989 an international workshop was held in Ahmedabad facilitated by ILO. In 1990 an international conference was held in the Netherlands, supported by the European Commission. Regional workshops held by the ILO DANIDA project in Manila, the Philippines, in 1991 and in Malang, Indonesia, in 1993, were attended by international observers. The Association for Women and Development (AWIS) conference in Washington, DC, held three sessions on homeworking attended by people from Asia, Africa, Europe, America and West Asia. At the grass roots level, in 1992, a conference for homeworkers was held in Bradford, attended by delegations from SEWA, India, Portugal and the Netherlands.

ORGANISING HOME-BASED WORKERS

Unions in industrialised countries, whose traditional strength and methods of organising have been based on large

workplaces, have generally found homeworkers difficult to organise. In the past, unions have fought - unsuccessfully - for the formal prohibition of homework. However, the enormous growth of home-based work which has accompanied the erosion of organised labour's traditional industrial base has begun to spur unions towards a greater awareness of the extent of the problem and to begin to organise these previously 'invisible' workers. In Canada and Australia, the International Ladies Garment Workers' Union (ILGWU) and the Clothing and Allied Traders Union of Australia (CATU) have initiated local campaigns to organise home-based garments workers. In Madeira, Portugal, the Union of Workers in the Embroidery, Tapestry, Textile and Craft Industries has for many years been organising embroidery homeworkers, winning important gains. In Italy, the Clothing and Textile Workers' Union (FILTEA-CGIL) organises homeworkers in the Pisa area. In the Netherlands, Greece and Spain, women trade unionists are developing programmes to unionise homeworkers.

Organising home-based workers requires flexible and creative ways of reaching out to workers in the domestic workplace and of winning public support. In many countries, homework (particularly in the clothing industry) relies heavily on immigrant groups. Organising materials must therefore be published in the languages of the immigrant communities. In Australia, CATU publishes its paper *Ragmag* in 12 languages. In Canada, the ILGWU has focused initially on work in Toronto's Chinese-Vietnamese community. Outreach work and research were done by Chinese-Vietnamese workers employed by the union. At another level, a publicity campaign has been waged to highlight the issue of homework and raise public awareness. This has focused specifically on the big retailers whose suppliers include small manufacturers employing homeworkers, enlisting support from consumers' organisations.

In Madeira, where there are currently over 38 000 registered embroidery homeworkers, many different methods have been used to reach the women. The union has made extensive use of the media to reach workers in their homes. In the early days of union organising, the church was used to spread information and gain access to meeting rooms. With almost every family on the island having at least one person working on embroidery, regular union meetings at factories could also be used to pass on information to other family members working at home. In Italy, the FILTEA-CGIL set up a 'flying squad' to reach homeworkers scattered over wide areas in small villages and towns near Pisa. The

union leafleted houses, street by street, organised public meetings in village squares and set up a phone line as a contact point. They distributed questionnaires to build up their information on homework at supermarkets and schools. Social events were organised to break down the workers' social isolation. This campaign resulted in the recruitment of 900 new home-based union members.

As the majority of homeworkers are women, organising often involves working from a base in the community and being prepared to develop a range of strategies or approaches to address the issues raised by homework and by homeworkers themselves. In many cases, this has involved an active alliance between the unions and women's organisations. The work itself is also bringing into the open the extent of homework and its importance to modern economies, re-emphasising the need to organise.

In the Netherlands, the Women's Union (Vrouwenbond FNV) has played a major role as a link between the homework support centres and the trade union federation FNV. The women's union is an official trade union which organises women whether they are in paid employment or not, but does not have negotiating rights.

In northern Thailand, homeworkers have been assembled into the Chiangmai HOMET through the efforts of the YMCA Chiangmai. Now it has a membership of 1 000 women homeworkers. The Chiangmai HOMET, with ILO DANIDA assistance, has provided revolving funds, assistance in marketing and training in small business management. Silk weavers in north-east Thailand have been trained in the technology of dyeing and ensuring colour fastness in their finished fabrics by textile division of the ministry of industry. Also through the latter, a common facility for selling the homeworkers' silk products has been established with funding from the government of Japan.

Homeworkers in north-east Thailand and women homeworker credit under the umbrella of the Credit Union League of Thailand (CULT, an apex organisation) as well as homeworkers from the urban slums of Bangkok in Rajburana are currently being encouraged to get together to form a coalition/ forum or network of homeworkers. A trade union, the Labour Congress of Thailand, has been organising shoemaking homeworkers in the urban slums of Rajburana in Bangkok. The CULT is being assisted by ILO to pay special attention to the credit union which consist largely of women homeworker members. Another NGO, the Appropriate Technology Association of Thailand, is initiating the establishment of an insurance for its home-based silk weavers. The Thai department of labour and employment, on

the first quarter of 1995, formed a joint consultative committee consisting of government representative to tackle homeworkers issues. A review of existing labour laws as they apply to the homeworkers is being done by the labour ministry's legal officer.

In the Philippines, in the 1989 a national network of homeworkers known as PATAMABA was formed which now consists of more than 3,000 members in various parts of the archipelago. To date PATAMABA is operating in 27 provinces of the Philippines. PATAMABA undertakes a variety of activities: organising, networking, education and training, socio-economic assistance, paralegal actions, lobbying, advocacy for policy reform. Over its five-year existence PATAMABA has been able to obtain a three million peso grant from the department of labour and employment. With technical and financial support from the ILO-DANIDA sub-regional project as well as the DOEI through the PATAMABA the homeworkers are getting assistance in product development, skills training, marketing and credit to support their socio-economic assistance, paralegal actions, lobbying, advocacy for policy reform. The PATAMABA is seeking ways of setting up a co-operative bank and co-operative insurance. The process has begun; its outcomes remain to be seen.

Home Net has been set up to co-ordinate work with home-based workers in different parts of the world. Since the 1970s there have been organisations for home-based workers which aim to make home-based workers visible and to fight for recognition of their rights as workers. The first of these organisations was the Self-Employed Women's Association (SEWA) of Ahmedabad, a trade union for women workers in the informal sector including home-based workers. Other groups have been set up in south-east Asia, south Africa, North America and Europe. In some cases trade unions have begun to organise homeworkers; in others non-government organisations have been set up in the form of networks or co-operatives. Over the last six years, there have been growing contacts between different groups in both north and south. In 1994, a meeting was held to set up an international network to extend these contacts and to co-ordinate international lobbying work in 1995.

The aims of the network are: (a) To build an international network for home-based workers and their organisations as well as NGO's, co-operatives, trade unions, researchers, women's groups etc., including all those directly or indirectly underlying work in this field; (b) To co-ordinate an international campaign for the improvement of home-based workers' conditions of work

at national, regional and international levels; (c) To collect and disseminate information on home-based work to members of the network and other interested organisations; (d) To assist in obtaining technical assistance for and act as a channel of the same to home-based workers.

HOME-BASED WORKERS AND ILO

At SEWA's urging the International Confederation of Free Trade Unions (ICFTU) adopted a resolution asking ILO to pass a convention for the protection of home workers. ICFTU has consistently followed up the issue with the ILO and in 1995 the annual conference of the ILO finally considered 'homework' as a topic for a convention.

The ILO is a tripartite body. All its decisions are made jointly with the national representatives of employers' federations, trade unions and governments, so that it is more down to earth and representative than any other UN agency. The conventions passed at the ILO are ratified by governments who then turn them into national labour legislation. This year was a first hearing of the Convention for Homeworkers. The Convention is completed in two consecutive years with a tripartite committee set-up to go into the details of the convention and the whole body voting on the convention in the final year.

The Convention on Homeworkers is unusual and innovative. Conventions for protection of unorganised sector workers have rarely been seen in the ILO. This is because the representatives of both the employers and the workers tend to come from organised industry and so most business of the ILO tends to concentrate on them. The drafting of the convention was carried out in the Tripartite Committee on Homework, a very formal affair. There were more than 200 participants in the committee. The workers' group was led by the Dutch Trade Union Representative Ikka Vandenburg. The employers' group was led by Alan Wild, an Englishman from Guinness Company. The committee was chaired by the government representative from Cyprus, Leuna Samuels. Generally, the employers and the unions took opposing points of view on most issues, so most decisions tended to depend on the majority of governments' standpoints. Some governments came well prepared and were fully aware of the issue. For others this was a new area, some even spent a few days in the committee giving statements before they realised that homeworkers were not domestic maids.

The acid test came right in the beginning, when the committee had to decide firstly, whether there should be any instrument at all, and if so what that instrument should

be. There are three types of instruments that can be adopted by the ILO, a convention, a recommendation or a convention followed by a recommendation. The convention ratified by countries is converted into national laws. The recommendation, as the name indicates, has no force behind it and is purely a guideline which does not need to be ratified. The convention followed by recommendation has both the force of a law and the recommendations as additional guidelines.

Before each tripartite meeting the workers, the employers and the governments met as separate groups to discuss their stand. The workers were solidly behind the convention followed by a recommendation. This unqualified support represented both the extensive work of SEWA HomeNet and the changing world economy which had encouraged the growth of homework. Only 15 years ago most trade unions, including in India, were against any form of recognition to homework as they felt it constituted a threat to factory workers. However, now most unions realised that they can no longer turn a blind eye to the conditions of homeworkers and that it was better to try to protect them and organise them. Another issue that some trade unions from the north felt keenly about was the growth of telework, that is homework in telecommunications. This included home-based bank clerks, telephone operators etc.

The workers' representative argued that the worldwide changes in forms of employment left a growing number of workers without any protection. Whole industries, for instance textiles and clothing, were transferring into homework and a rapidly evolving information society was leading to new forms of homework such as telework. Homeworkers are vulnerable as their employers often refuse to recognise them and also they are generally women, who have no links to trade unions. The vulnerability and lack of protection leads to low pay, bad working conditions and no access to medical care etc. This is why they need to be both protected and organised. The employers' representative disagreed. He said that there are too many varieties of homework and so cannot be included in one group. He identified four types of homework - traditional or pre-industrial homework in industrialised countries, telework and mobile professionals. Telework, he felt, was still evolving and so should not be regulated.

Given the above, the definition of homework has many difficulties. How to separate homework and office work? The nature of relations between worker and employer? A homeworker's consultant often shifts relations from workers to contractor. The second point he emphasised was the lack of data. How can homework be regulated without enough data? Even existing data is

inaccurate, and there is no data from the African continent. Existing data shows that homework is a form of micro enterprise which provides employment opportunities and hence should not be regulated and driven underground. He also mentioned that homeworkers were already covered by existing conventions, such as conventions on freedom of association forced labour, equality of opportunity, minimum wage fixation, maternity protection, old age insurance, etc. He said that the experience of existing legislation showed that implementation is difficult and counter-productive. Existing laws do not work effectively and regulation leads to informalisation and driving work 'underground' as it happened in Hungary. Homework, he felt had many positive aspects. It provides employment to women, aging, disabled, marginal workers. So we should improve lot of homeworkers by (a) better understanding of homeworkers (b) Action of local levels to promote existing regulations (c) raising awareness of homeworkers facing, community support (d) exchange of information or policies which work (e) study telework.

Governments took differing points of view. The European countries were strongly for the convention, except for Germany. The UK was strongly against it, the only country which said that in fact there were hardly any homeworkers and those that existed were well off and did not need protection. The government representatives of developing countries, India, China and Mexico generally agreed with the need for protection of homeworkers, but held that they may be unable to implement a law.

The debate centred around whether the ILO should adopt a convention followed by a recommendation, or the much milder recommendation.

The arguments given by countries which supported the convention were: (1) Vulnerability of homeworkers (Australia, Sweden); (2) Basic labour law is not sufficient (Japan); (3) There is a general undervaluing of homeworker (Sweden); (4) Homeworkers constitute a sizeable portion of workforce (India, China); (5) Home workers do not have social protection (low remuneration, no social security, health and safety) India, China, Mexico, EU (12 countries); (6) Legal protection is required in the context of increasing homework and of policies which encourage homework (China, 12 countries, Morocco, Mexico); and (7) Homeworkers belong to informal sector (EU).

The reasons given by countries to oppose the convention and support only the recommendation was: (1) Over regulation of homework would drive it underground (India); (2) There are too many difficulties to define employer-employee relationship.

(India); (3) Implementation of standards may reduce employment opportunities (India, China); (4) Conditions in different countries are too diverse (China); (5) There is too much diversity in types of work, so we cannot refer to homeworkers as one group (UK); (6) Homeworkers are already covered by existing conventions (UK); (7) The convention is premature (UK); (8) Some governments did not like sector conventions (Canada); (9) A recommendation has much more flexibility (Egypt, China, India, Mexico), and (10) Some countries felt that a convention may weaken their own laws, which are more comprehensive (Germany, Sweden). However, when the issue went for the vote, the convention was adopted by a very narrow margin. The vote was so close that the employers were not satisfied by a counting of hands, but insisted on a formal recording of the vote, leading to a revoting procedure. India and China both abstained. In this case too the vote for the convention was carried through.

Once the instrument was adopted by the committee, the details were argued out in detail. One of the most difficult issues dealt with was the definition of the homeworker. This is an issue which we feel will arise whenever there is an attempt to give protection to the informal sector worker. The definition of worker and employer has evolved over the years in a certain context – that of the factory and of a clear employer-employee relationship. However, most unorganised sector workers are outside that definition.

The ILO has already made a start in redefining worker in the context of the rural worker, whose definition includes small farmers and artisans. The definition for homeworker, is another step in the redefining of what is a worker. At an Asian regional workshop of trade unions, the following definition was proposed: (a) the term 'home-based work' should mean work carried out by a person, to be referred to as home-based worker, (i) in his or her home or in other premises (not being the premises under the control and management of the employer) he or she has chosen; (ii) for remuneration; (iii) which results in a product of service as specified by the employer, whether the equipment, materials or other inputs used are provided by this person, the employer or the intermediary, and includes a person who works on his or her own account with or without the help of the family and who does not employ other workers.

However, the workers group at the ILO, could not accept the inclusion of own-account worker. The governments too were keen to have a definition which separated the 'truly' own-account worker from the homeworker, and yet at the same time did not exclude the different varieties of homeworkers.

The final definition adopted was: The term 'homework' should mean work carried out by a person, to be referred to as a homeworker, (i) in his or her home or in other premises of his or her own choice, other than the workplace of the employer; (ii) for remuneration; (iii) which results in a product or service as specified by the employer, whether the equipment, materials or other inputs used are provided by this person, the employer, or the intermediary, as long as this person does not have the degree of autonomy and of economic independence necessary to be considered an independent worker under national laws, regulations or court decisions. Although there was protest from the employers, the term 'intermediaries' were also defined in this convention, as most homework is given out through intermediaries.

Apart from the definition the convention included the following measures: (1) Equality of treatment with wage earners, in particular in the right to organise, in remuneration, statutory social security protection, access to training, maternity benefits, safety and health provisions, minimum age and protection against discrimination in employment; (2) including homeworkers in basic labour statistics; (3) regulating intermediaries, and (4) systems of inspections.

The recommendations were much more detailed and spelled out the following factors: (1) Methods of implementation of the labour law concerning homeworkers; (2) collection of information; (3) supervision by the competent authority and required records; (4) remuneration; (5) occupational health and safety; (6) the right to organise; (7) hours of work, rest and leave; (8) social security and maternity benefit; (9) protection in case of termination of employment; (10) resolution of disputes; and (11) programmes to assist homeworkers.

STRUGGLE AHEAD

The battle however is not yet won. The employers have declared themselves to be totally against a convention, and have vowed to fight against it next year. As Anand, the Employers' representative from India said in the ILO Conference which finally adopted the report, "We, in India, propose to resist it (the convention) at subsequent discussions here and at subsequent conferences and committees, and at the National Conventions Committee in India". Moreover, a number of countries which were not much involved with the discussions, may next year come up with a new position. However, the workers' group has been solid throughout and a wave of support next year also may lead to one of the first and most detailed conventions for unorganised sector workers.

ANC Wins Municipal Elections, but Hurdles Remain

Pierre Beaudet
Hein Marais

The results of last month's municipal elections have confounded predictions that the slow and uneven pace of socio-economic transformation achieved by the ANC-led government of national unity would see protest votes siphoned off to more populist-minded candidates and parties. All the same, there are several reasons why the expectation that with duly elected town and rural councils in place the government's Reconstruction and Development Programme will at last effect tangible change in black townships and rural communities may not be fulfilled

A MONTH ago Patrick Xegwana was a dishwasher at a student's residence on the campus of the elite Stellenbosch University. Now he is a councillor on the municipal council in a university town which spawned six apartheid prime ministers and where for decades academics laboured less at promoting enlightenment than at designing and fine-tuning the apartheid system.

Xegwana's triumph was one of many surprises registered by the ANC in the country's first ever democratic local government elections in early November. The ANC swept the boards, winning 57.7 per cent of the popular vote. The nearest rival, the National Party of F.W. de Klerk, trailed with 21.2 per cent of the vote. The Inkatha Freedom Party (IFP) polled only 0.6 per cent of votes, confirming its failure to become a national party. (Violence-wracked KwaZulu Natal, where IFP support is strong, did not vote; its residents will only go the polls next year.)

In provinces like the Free State, the ANC will run virtually every town council, most of which will have only ANC councillors sitting on the benches. In the Western Cape (where the ANC was thrashed by the NP in last year's general election) the ANC now runs most of the major towns and many smaller rural communities. The reason? An unexpected breakthrough among coloured voters, many of who abandoned the NP and voted ANC, which has claimed a 35 per cent swing from the NP (Cape Town, however, did not vote; a dispute over ward boundaries forced postponement of local government elections there until next year.)

The ANC has greeted these results as a resounding mandate. Certainly, the tallies have confounded predictions that the slow and uneven pace of socio-economic transformation achieved by the ANC-led government of national unity would see protest votes siphoned off to more populist-minded candidates and parties. This didn't happen. The party of renegade former ANC politician Rocky Malechate-Metsing, a

rousing populist, for instance, netted fewer votes in the mostly rural North West province than did the party of former Bophutswana homeland dictator Lucas Mangope! And the Pan-Africanist Congress, long regarded as a potential haven for disgruntled ANC supporters, collected only 1 per cent of the vote – less than the elitist urban-based Democratic Party.

THE ANC IN POWER

It has been a good year for the ANC in power. The miracle of April 27, 1994 has lost some of its sheen and vibrancy, but the ANC has succeeded in holding a fractious society together. It has checked the secessionist aspirations of the IFP in KwaZulu Natal (though the battle is far from won). It also weathered the challenge from the white Right which is now in terminal decline. Conservative Party leader Ferdi Hartzenberg reflected on the party's 1.65 per cent vote by admitting that 'it is a blow for the party and it is a blow for self-determination'. With 51 per cent of votes, the slightly more moderate Freedom Front looks stronger than it is; it suffered defeat in every town it claims as part of a Afrikaner homeland, including Pretoria, the putative capital of a volkstaat.

The news is less heartening, however, on the socio-economic front with one exception. Goaded along by the organised workers' movement, the labour ministry has nursed into being new labour legislation that ranks on a par with systems now under siege in many social democracies of the North.

But the macro-economic context in which the ANC hopes to improve the lives of the South African majority remains surprisingly conservative. Accepting what it regards as global economic realities, and cheered on by capital, the ANC has opted for economic policies that differ from those inherited from the apartheid government only in their heightened emphasis on 'liberalisation'. Exchange controls were loosened earlier in the year, prompting a modest rise in foreign

investment which remains, however, diffident and speculative. Curbs on spending (through high interest rates) have pushed inflation below the 10 per cent mark but they have not improved levels of savings nor encouraged significant productive investments by domestic capital which retains its penchant for short-term speculative investment expressed extravagantly in the new office complexes and upmarket shopping centres that clutter elite white suburbs. As a result, the economic growth rate, labour, beneath the 3 per cent mark, severely narrowing the scope of the socio-economic changes the ANC has been promising.

Dormant for now are any signs of a development path that would creatively link initiatives geared at achieving both economic growth and redistribution of resources and opportunity in favour of the majority. Eighteen months ago, the vaunted Reconstruction and Development Programme (RDP) still pointed in that direction. Nowadays it conflicts only marginally and hesitantly with the imperatives of South African business which remains obdurate in its belief that boosted economic growth has to precede large-scale socio-economic transformation. The ANC's retreat on this front is perhaps not yet final. Elements within the Congress of SA Trade Unions (Cosatu) and the SA Communist Party (SACP) are fighting a rearguard battle to check the slide, but the ANC has drifted markedly towards becoming the administrator of a 'trickle-down' development process.

Nevertheless, the ANC's election success has spurred new hope that the RDP might finally get out of the starting blocks and effect tangible change in more black townships and rural communities. To date, the RDP has lumbered forward with grand development projects often arrested in the planning phase. Among the many factors compounding the delays has been the absence of functioning local government in most of the country. Those projects that have made it to the implementation stage often dissipated in a twilight zone of debilitated municipal councils. Now argues the ANC, that changes. Duly elected town and rural councils are in place; development can proceed.

INCLUSION OR EXCLUSION?

But several factors caution against this kind of triumphalism. For even in towns where the ANC occupies every single seat on the new council, it will still not control that town.

There are several reasons for this paradox. First, the financial revenue at the disposal of these councils is derived mostly from white (and to a lesser extent Asian) business people, property owners and farmers. These sectors – which voted mostly for the NP and the right-wing Freedom Front – hold an effective financial veto over the ANC-run town councils. If the ANC town councils opt to steamroll new initiatives they might trigger rates and other boycotts by the white residents. The central paradigm of the South

African transition – inclusion and consultation – therefore persists: these councils will have steered their transformative plans through arduous and sluggish negotiations where the balance of power is determined less by votes than by financial muscle, and by planning and management expertise.

Which brings us to the second inhibiting factor. Echoing the dynamics at the national level, the ANC has now attained political power at the local level, but the party lacks the capacity to extend that dominance into the crucial administrative and management zones. The ANC and its allies have a thin layer of technical experts at their disposal: most have been drawn into national and provincial government; many others have opted for lucrative careers in the private sector. Thus the technical apparatuses in these towns will still be run by the old order, creating a kind of dual power situation that is likely to bring hopes of rapid development (if this stymies or delays desperately needed development projects, one outcome might be revived civil protest by black residents, albeit less organised and strategic than in the past).

Thirdly, this lacuna at the local level strengthens the hand of provincial governments. Seven of the nine provinces are run by the ANC, but this does not guarantee common purpose or shared priorities between provincial and municipal or rural politicians. South Africa's desolated periphery – its rural areas, where 40 per cent of the population survive precariously – has not become a priority for the ANC as yet, despite occasional rhetoric to the contrary. If current trends hold, ANC-led provincial governments are likely to focus resources on urban and peri-urban areas.

The upshot is a transformation process that will continue to grind slowly and unevenly. A more ominous challenge is also brewing in the rural outland, one that reveals a perilous hurdle to the transition. Pursuing, essentially, a modernist agenda of transformation, the ANC has long looked disparagingly on the country's traditional systems of authority – the intricate networks of chieftainship and traditional culture that still hold sway in many parts of South Africa. It is in these zones that Gusha Buthelesi's Inkatha Freedom Party has entrenched itself within the KwaZulu Natal province. There the ANC has laboured in vain to expel the IFP from that support base.

Now tradition's challenge is mounting in the Eastern Cape. Days before the November elections, traditional leaders there threatened to boycott the vote. They contended that the newly elected town and rural councils would sideline the chiefs and their traditional structures. Instead they demanded a guarantee that their structures should administer communities in tandem with the new authorities. The ANC has balked at the proposal. These traditional structures are unelected, often corrupt and (being staunchly patriarchal and authoritarian) socially regressive, it says: democracy and

progressive change must hold sway. Principled as the ANC's response might be, it lacks the pragmatic and conciliatory stances the party has adopted towards much more recidivist political players. As one Eastern Cape chief put it: "What we do not understand is why the ANC is happy to make deals and rule with the NP and the IFP, but it calls us reactionary and rejects us."

Until now the ANC has managed this contradiction between the modern and the traditional through a nominally allied organisation, the Congress of South African Traditional Leaders (Contralesa). The organisation was formed in 1987 with ANC blessings and support as part of a bid to undermine the Pretoria-sponsored homelands, and later to thwart the IFP's stranglehold on traditional leaders in KwaZulu Natal. But already there are signs that Contralesa is nobody's stooge.

After Contralesa's president, Patikile Holomisa (also an ANC member), mooted a possible boycott of the elections, ANC secretary-general Cyril Ramaphosa urged the party to consider disciplinary action against him. Holomisa reacted by announcing his intention to resign from the party. Holomisa is not a high-profile party figure.

The importance of his threat lies elsewhere. Few South African history books tell readers that Gusha Buthelesi, today the scourge of the ANC, once also belonged to that party, nor do they inform one that Buthelesi formed Inkatha with the sanction of the ANC in 1975, only to be forced out of the ANC five years later in what was arguably a grave tactical error. By keeping Buthelesi within the party's fold, the ANC might well have continued that threat he later came to pose: the same applies in Holomisa's case.

It is too early to tell how this challenge from traditional leaders might play itself out. One option quietly mulled over by some Eastern Cape chiefs is to create a new political vehicle to better defend their interests, thereby casting issues of traditional authority and culture in a new political form. Radical populists like Winnie Mandela, who has pointedly maintained close relations with Contralesa and its Eastern Cape leadership, might also decide to exploit such a development. The outcome, though, depends on president Nelson Mandela.

Until now Mandela – a prince of the Xhosa Thembu tribe in the Eastern Cape, the second largest tribe in the region after the Xhosa – has adroitly straddled the divide between the traditional and the modern, regularly consulting with traditional leaders in that province. The question now is which way he will tilt in this latest stand-off.

The nation-building project in South Africa remains personified by Mandela, who gingerly persists at his balancing act of national reconciliation. "I started reconciliation in South Africa after a lot of humiliation," says Mandela. "I am the architect of reconciliation." He shuttles between meetings with the remnants of the old order (like his controversial tea

appointment three months ago with the Betsie Verwoerd, the widow of apartheid architect Hendrik Verwoerd) and his own expectant constituency, corralled into township slums. Except for the relatively slim layer of upwardly mobile blacks who are rapidly being conscripted as junior partners in the white-run economy, reconciliation remains a symbolic enterprise that is not yet reflected in social intercourse.

TRUTH AND RECONCILIATION COMMISSION

Perhaps the grandest attempt to cast reconciliation into an institutional form is the Truth and Reconciliation Commission. Modelled on the Chilean Truth Commission, this body is charged with investigating and documenting human rights abuses committed during the apartheid era. In return for indemnity from prosecution, perpetrators of such crimes will testify before the commission, which will start its work by early 1996. The theory is that the promise of indemnity will prompt comprehensive revelations of human rights crimes committed during the apartheid era, both by the security forces and to a much lesser extent by the liberation movement. And once the truth has been revealed, the nation can begin healing itself.

But the success of this commission now hangs in the balance. Days before the local government elections, the KwaZulu Natal attorney-general Tim McNally made the surprise announcement that he would prosecute 18 former top-ranking security officers, including former minister of defence Magnus Malan. The accused have appeared in court, charged with complicity in the 1987 Kwamakutha massacre of civilians.

Malan and his co-accused immediately cried foul, claiming that the move conflicts with the spirit of the Truth Commission. The accused had two options: apply for indemnity in exchange for their testimony before the commission, or take their chances in the court case. The stakes they are playing for are high: surprisingly, they have chosen the latter route. Their defence will likely rest on a slew of technical objections and challenges in the Constitutional Court. And their case is bolstered by the fact that solid documentary evidence of their crimes is in short supply, despite the work of outfits like the Investigation Task Unit which built the case against these generals in 1990: security officials incinerated tons of incriminating documentation. Should Malan and co win their case, they will set a benchmark legal precedent, enabling apartheid criminals to hold their silence and shun the Truth Commission, knowing that once threatened with prosecution they too can take their chances in court – and perhaps win. If that happens, the Truth Commission becomes a shadow play and the grand bid for national reconciliation might run aground. Will Nelson Mandela's ensemble of symbolic gestures and exhortations then be sufficient to soothe the pain and bitterness that cour through South African society?

Move to Balance US Budget

S N Guha Thakurta

The moves to balance the US budget by cutting down on welfare and environmental protection will affect the poor drastically

AFTER months of debate, the US House of Representatives approved by a 227-203 vote October 26, 1995 measures to balance the budget by lowering taxes, rolling back many of the welfare schemes in vogue since the 1950s and in effect curtailing the role of federal government in welfare financing. It signalled the victory of the Republicans who promised the Americans a balanced budget by the turn of the century, cutting taxes.

While the Republicans perceive this as a great victory 'a radical change' 'a revolution without bloodshed' on the same scale as the Great Society' the Democrats who opposed the proposal (barring 4 out of 199) consider the move as anti-poor and anti-middle class as the benefits would now flow from the needy to the greedy. No doubt the issue will be a major divide between the Conservative Republicans and somewhat centrist and liberal Democrats. Meanwhile president Bill Clinton has threatened to veto the Republican plan in its present form and content. Political commentators feel that a middle way will be found through negotiation for after all an issue like deficit reduction and curtailing federal spending cannot just be washed away. American people have not experienced a high or even a moderate degree of inflation for a long period.

The Republicans plan to balance the budget by 2002 and cut taxes by \$ 245 billion in a seven year time frame. Few areas of government would remain untouched. Spending on programmes aimed at the poor — cash welfare, Medicare, Medicaid, the Earned Income Tax Credit for low wage workers has been drastically cut back accounting for the bulk of the anticipated savings. Welfare and Medicaid schemes on which a saving of \$ 102 billion and \$ 169 billion respectively is expected over a seven year period, are to be handed over to the state governments who would receive block grants for administering the schemes. Under welfare provisions if the Republicans plan has the final say the state governments would run child care and child protection, school meals and nutrition for pregnant women and children etc. Most of the aid hitherto given to legal immigrants are proposed to be cut. The new measures also talk about debarring federal aid to unwed teenage mothers or children born to such mothers. Besides,

eligibility to low income elderly persons receiving supplemental security income as well as to blind and disabled persons will be restricted. Legal immigrants receiving aid would have to find work within a period of two years.

Medicare provisions propose to yield a saving of \$ 169 billion over a seven-year period by (a) terminating the long-standing entitlement to health care for the poor, (b) repealing federal nursing home standards, (c) creating and then ultimately putting a maximum limit to the federal block grant to the states.

The maximum amount of saving has been expected to be generated through scaling down Medicare provisions over the seven year time frame — \$ 270 billion — by (a) reducing payments to doctors and hospitals (\$ 152 billion), (b) raising premium of senior citizens for doctors' visits (\$ 54 billion), (c) increasing fees from wealthier recipients of Medicare facilities and/or encouraging them in managed care plans or in other private insurance programmes (\$ 31 billion) and (d) by further curtailment in health care provisions. It is interesting that on the question of reducing agricultural subsidy (\$ 13.4 billion) no agreement has been reached. For example, most California Republicans voted to save the agriculture market promotion programme, safeguarding subsidies.

While middle class Americans will feel the pinch of the proposed changes in Medicare, Medicaid and other welfare provisions, a drastic reduction in agriculture subsidies will affect dairy and farm export income. The Republicans plan also rolls back a number of environmental protections. The Arctic National Wildlife Reserve is proposed to be opened to oil companies for exploration. By selling national assets in the strategic petroleum reserve, the defence stockpile and ski areas on the one hand and by trimming several other measures like for example student loans, some veterans benefit etc. on the other, shortfall in tax revenue is sought to be covered up.

The Republicans argue that the short-term effects of the Americans will be ultimately offset by the economic benefits of a balanced budget since a zero deficit would mean a reduced interest rate which would be beneficial to consumers and producers alike.

In the short run most will benefit by tax cuts in many forms, namely, a reduced capital gains tax for individuals and corporations, estate taxes, etc. Some of these cuts will augment individual retirement accounts (IRA).

Although president Clinton threatened a veto, he also explicitly stated that he too favours a tax cut, a reduced federal expenditure and above all an approach towards a balanced budget. Political analysts seem to be correct in stating therefore, that the Republicans and not the Democrats have already won their declared battle just on the eve of 1996 election. At any rate, the outcome of the budget proposal seems to be tilted in favour of the Republicans' conservative goals with some mix of the Democratic flavour in favour of education costs and IRAs. Some commentators concede that this budget does include two reforms that really could be historic. One by removing the federal entitlement to welfare and Medicaid, the proposed change will be hard for any future Congress to reverse without offering a huge bribe to 50 states. "Throwing welfare to the states may or may not be a journey from the known to the unknown but states can hardly do worse off than the federal government. The other deal is Medicare. By taking away the middle class entitlements, Republicans have done what many liberals said they would never dare to. By planting the seeds of market competition, they are privatising the insurance side of Medicare (uncle Sam will still be the financier). The efficiencies that will result will ease pressure to raise taxes and set a precedent for reforming the grandmother of all entitlements, social security." (Paul A. Gigot in *The Wall Street Journal* October 27, 1995). Though there was some tinkering with the original House of Representative proposal by the American Senate the following day, the Republican proposal was passed by a 52-47 vote. Some more changes may follow at the negotiation stage. Bob Dole, a Republican leader and aspirant for the White House in next election, called the plan a defining moment and a turning point toward reducing the role and scope of the federal government while Democrats wanted to wash their hands off such a thing. But Democrat president Bill Clinton does not appear prepared to budge. Before or after veto," he said, "I am not prepared to discuss the destruction of Medicare or Medicaid, the gutting of our commitment to education, the ravaging of our environment or raising taxes on working people."

Postscript The Americans officially put their clocks back by one hour from midnight tonight — within 24 hours of passing the proposal by the Senate.

Democratisation of the United Nations

Lavanya Rajamani

As the UN completes its 50th year, its two principal organs – the general assembly and the security council – are the focus of reforms for reflecting changed equations in international relations

DAG HAMMARSKJÖLD envisioned the United Nations (UN) as a place for the mutual search for a balance of differing contradictory yet real interests of the contemporary community of states and nations. Far from reaching this goal, the UN today has perhaps moved even further away from contemporary realities and interests than before. In the 50 years since the framing of the charter, there have been dramatic changes in the international power structure. The membership has more than trebled, a large number of developing countries have emerged as important groups in international affairs and a number of sovereign independent territories have been brought into existence [Jain 1978: 284]. The end of the cold war too emphatically changed the power equations in the international sphere heralding the way for a non ideological phase in world diplomacy (CSR January 1992). The burgeoning importance of economic might in international relations is but the obvious successor to the ideology driven politics of yesteryears. And faced with near financial bankruptcy and 1.3 trillion dollars of external debt of developing nations playing havoc with national economies, the UN is in practically uncharted waters [Kumar 1994]. The juxtaposition of all these tendencies and changing equations offers a unique opportunity for a reassessment of premises and a restructuring of power relations in the UN. In the words of David Lange, a former prime minister of New Zealand:

The world now more than ever needs a strong international organisation. We need a UN which genuinely expresses the collective will, upholds common standards and is willing and able to take concerted and consistent action wherever there is a default in its resolutions and international law [quoted in Gupta 1991: 19].

Though the call for democratisation and restructuring of the UN is as old as the charter itself, it is only in recent years that it has gained momentum. A 22 page 'Accra Declaration' adopted by the 103 nation strong non-aligned movement (NAM) on September 8, 1991, argued in favour of a more democratic and transparent UN, set up in the light of the end of the cold war and

a drastically changed balance of power equation (CSR January 1992). Though the relevance of NAM today is a debatable issue, the compelling moral authority of a decision backed by 103 nations is undeniable. On the home front too, the 1992-93 annual report of the ministry of external affairs of the government of India strongly advocates the democratisation of the UN to make it more effective [Kumar 1994].

Taking about the need for democratisation as axiomatic, the modalities are yet to be worked out. Suggestions made at the time of framing the charter have suddenly come to light now in an increasingly conducive atmosphere. Yet the how, when, wherefores have been subject to considerable controversy and academic debate. There are those who argue that the shortcomings of the charter are not due so much to its constitution as it is to the play of vested interests among the members and so they cannot be amended out of the charter. There are others who argue and believe that the UN charter should not be seen as immutable and sacrosanct, that an instrument adopted in 1945 could not realistically be expected to be adequate to meet all the challenges of a changing world. In the words of the Algerian delegate to the 31st session of the UN general assembly:

The respect which all states feel for the UN should not lead to fetishistic attitude, that conceal the defects of the UN resolutions, the failures of its actions and the powerlessness of some of its structures [Jain 1978: 288].

There is considerable merit in both the arguments and that is precisely why the question of reform must be dealt with carefully. The process of reform must be informed by the contemporary political realities which govern the international relations to be of any practical significance. While the goal of providing a greater role to all nations in the decision-making process based on the sovereign equality of all states, is certainly laudable, it must be kept in mind that any wholesale restructuring based on a completely different theoretical basis or radical reforms involving substantial amendment would never pass muster, for the permanent members are yet loathe to sacrifice any of their prerogatives. Only gradual

reforms, with minimal amendment and involving an equal balance of advantage for the superpowers would result in any concrete and long-term change. The echo of this philosophy can be evinced in Jawaharlal Nehru's address to the general assembly in 1960,

The structure of the UN when it started was weighted in favour of Europe and America. It did not seem to us to be fair to the countries of Asia and Africa, but we appreciated the difficulties of the situation and did not press for any changes. With the growth of the UN and with more countries coming into it, that structure today is still more unbalanced. Even so, we wish to proceed slowly with agreement and not to press for any change which would involve an immediate amendment of the charter and raising of heated controversies. Unfortunately we live in a split world which is constantly coming up against the basic assumptions of the UN. We have to bear with this and try to move ever more forward to that conception of full co-operation between nations [quoted in Katyal 1994].

Having outlined the goal and the approach of reforms, the target areas need to be identified. The structures, powers and functions of the two principal organs of the UN, i.e. the general assembly and the security council, are probably the focus of all reforms for any changes in the equations between these two organs and their respective compositions and powers would reflect in the other organs and in international relations in general. A re-examination of the charter and a revision of the charter are the two available approaches to democratisation of these two principal organs. The former would probably be the more interesting for its assumptions would shock conventional wisdom.

RE-EXAMINATION OF THE CHARTER

It is undeniable that the effectiveness of the UN arises out of its benevolent image and its aura of a global platform of universal peace, rather than a fear of its military might [Bhagat 1992: 23]. It is its moral authority which determines the course of events, not its coercive machinery or enforcement capability which is yet to be fully actualised. Therefore, it may be the general assembly which is universal in character, which may be the more important and decisive organ. The myth that most academicians propound as to the purely deliberative and recommendatory character of the general assembly may be just that, 'myth'. Being creation of vested interests, these myths serve their cause well. Merely because the resolutions of the general assembly are not backed by coercive sanctions does not imply

that the general assembly is powerless. Quite often sanctions imposed by the security council, itself are violated, as for instance the trade sanctions against Iraq; this does not make the security council bereft of power. Thus, the general assembly is much more than a deliberative organ. It is a vibrant and dynamic organ with universal reach and immense powers within the existing charter itself. A re-reading of even a sample few provisions would highlight this.

Article 1 of the UN charter outlines the organisation's purposes and principles. They are, briefly: (1) maintain international peace and security; (2) develop friendly relations among nations; (3) achieve international co-operation in solving international problems of an economic, social, cultural or humanitarian character; and (4) to be a centre for harmonising the actions of nations in the attainment of this common end.

While the last three are exclusively in the domain of the general assembly, the first is in an area of concurrent jurisdiction. The role of the general assembly in this traditionally believed area of the security council, was conceived and developed in the San Francisco charter itself. Articles 10 and 14 providing the general assembly to recommend measures for 'peaceful adjustment of disputes' to the security council were incorporated following scepticism regarding the likelihood of co-operation among the major members and insistence by lesser powers for a larger measure of participation [Goodrich 1990:190]. A significantly larger role seems thus to have been envisaged for the general assembly. Its capability to deal with this role is obvious from its history. Ever since the inception of the UN, the security council had been crippled by the indiscriminate use of the veto leaving the entire promise of the charter to be fulfilled by the general assembly. The general assembly set up an interim committee in 1947 to exercise control of the assembly over major political problems [Bowett 1992:49-51]. In 1950 the assembly also passed the Uniting for Peace resolution whereby it assumed to itself the power to determine a threat to the peace, breach of the peace or act of aggression and to recommend action by members including the use of armed force, if the security council, because of lack of unanimity, failed to exercise its primary responsibility for the maintenance of international peace and security. Pursuant to this resolution, the assembly set up a Peace Observation Commission and a UN force. The assembly also dealt with the Suez question in 1956 and the Congo question in 1960 under its authority [Bowett 1992]. Since the legal basis for all the peace-keeping operations of UN till today is unclear, it could be well argued that in the light of Article 17(2) and

the assembly's obvious capacity to deal with peace-keeping operations, the power to organise such operations should be construed to be with the assembly. This could gradually evolve into a custom like certain unhealthy practices (double-veto) have. In any case when the validity of such action was examined by the ICJ in the certain expenses of the UN case, the court clearly opined that the council had the primary responsibility and not exclusive responsibility for maintenance of international peace. The court implicitly held that the assumption of power by the assembly was lawful.

Article 18(2)² of the UN charter which deals with 'decisions' of the assembly on 'important matters', could again be argued to be binding rather than advisory. So also various other articles but the message is the same; the general assembly, the most representative and democratic of all international bodies has endless powers and with proper focus and clarity it could be the best guarantor of world peace.

REVISION OF THE CHARTER

The popular responses to the call for democratisation of the UN have always been limited to proposals restructuring the security council. For, perhaps the most obvious inadequacies lie here. The UN security council does not reflect contemporary power equations for Germany, the most powerful European nation and Japan, the economic superpower have no permanent seat in the UN. The UN also lacks moral authority by keeping almost the entire third world outside the decision-making apparatus [Singh 1991:11]. The large majority of the world, some having just put the colonial era behind it, question the entitlement of five nations to form a cabal to run the world [Goodrich 1990]. Proposals therefore for expansion of the security council and abolition of the 'veto' are as old as the charter itself.

Expansion of the Security Council: There are two issues which can be addressed under this, i.e. increase in the number of non-permanent members and increase in the number of permanent members. Increase in the number of non-permanent members of the council is an issue which has been raised time and again in the assembly and an informal 'gentleman's agreement' was reached among the major powers in London in 1946 on the allocation of non-permanent seats [Goodrich 1990]. Even at that time this was strongly condemned by Vijayalakshmi Pandit who believed that distribution of the council seats by secret diplomacy, to which some of the members of the general assembly were not a party, could not be supported under the international law [Green 1962:48]. Her voice, however, did not carry enough strength to sway the major powers. Though subsequently the strength of the non-

permanent members was increased, there was no corresponding outlining of criterion for eligibility. As clearly expounded by the Egyptian delegate at the San Francisco conference

...(If the designation of the non-permanent members of the Council is provided for, without some positive criterion being the basis of their election, and if it is left to the hazards of the ballot, to the temporary combinations or struggle for influence, then, in spite of the broadening of the council, the representation of the whole group of smaller states may still prove entirely inadequate [Green 1962:50].

The veracity of this proposition has been borne out today by the experience of 50 years of vested interest politics in the selection of the non-permanent members. But determination of criterion for selection of these members is another difficult task. The Indian delegate at San Francisco suggested that (1) population, (2) industrial potential, (3) willingness and ability of countries to contribute to international security arrangements, and (4) past performance must be considered to gauge the position of the country for the next 25 years for candidature to non-permanent seat [Green 1962:51]. Unfortunately, these pieces of far thinking wisdom were rejected by the superpowers with the result that under the charter most nations can nominate themselves for candidacy, an anomalous situation at best. Now, that the might of the then small powers has increased tremendously, the political climate may be ripe for these suggestions to be brought to light.

The demand for expansion of the permanent seats in the council is an issue which has vexed the UN for quite some time now. The five members selected at its inception reflected the war-time alliance and balance of power. This alliance was also the assumption upon which the idea of the security council as a 'guarantor of world peace' was constructed. The subsequent breakdown of the alliance and rivalry between the powers, leading to a virtual deadlock in the council, revealed the inherent deficiency of a system which was inflexible and provided no room for change in tune with contemporary political realities. Only a broad-based security council could be made to acquire the requisite moral, democratic sanction and political effectiveness.

The secretary-general of the UN has been, in part, responsible for this growing demand. While in 1982 the secretary-general expressed the need to use the council as a public podium, in 1992 in his report 'Agenda for Peace', he expressly suggested that the security council take in five more permanent members, i.e. India, Brazil, Germany, Japan and Nigeria. Germany and Japan in view of their economic might and the other three

because of their size, location and potential for rapid technological advancement (CSR, October 1992) This suggestion was based upon the realisation that a strong, representative security council is essential for a collective fight against poverty, hunger, economic inequality and technological backwardness Though these thoughts had been expressed before, admittedly by the Accra declaration of NAM in 1992 and subsequently in the general assembly on November 23, 1992 (CSR January 1992) coming from the secretary-general carries much greater weight

India too has been consistent in its stance vis-a-vis the restructuring of the security council In its 1992-93 annual report, the ministry of external affairs clarified that India was pressing for expansion of the council not revision of the veto It identified the three issues of its concern (1) The actions of the security council should not impinge upon national sovereignty in the name of human rights (2) The decisions of the security council should reflect the consensus of the general assembly (3) The security council should be answerable to the general assembly [Kumar 1994]

All in all the revision of the charter to accommodate for these trends seems to be a foregone conclusion Expansion of the security council both in terms of permanent and non permanent members to make it representative enough to discharge its onerous responsibility in the expected transparent and democratic manner is the desideratum of the hour

Review of Veto Power The provision of veto power to all the permanent members of the security council is an issue which has been plagued by controversy right from the initial deliberations leading to the UN charter The participants in the San Francisco conference were bitterly opposed to the veto provision but as they were aware of the then political realities they acquiesced albeit reluctantly [Green 1962] But their strong arguments had at least the limited effect of ensuring that the veto would only apply to deliberations of the council which might initiate a chain of events which would require enforcement action [Harry 1951: 55] The theory underlying this provision is however not without its logic If one of the major powers were to prove recalcitrant or were to refuse to abide by the rules of the international behaviour that were inscribed in the charter a situation would be created in which the recalcitrant nation might have to be coerced and obviously no major nation could be coerced except by the combined forces of the other major nations This would lead to a world war the prevention of which was the very purpose of the UN [Pavolsky 1951: 80-81] Though the veto power is rooted in sound logic in practice its use led

to the paralysis of the council in several key situations requiring immediate attention The role of the council as the guarantor of world peace was severely diluted especially when it remained helpless in several conflict situations, such as the one in Czechoslovakia in 1948 and in Korea in 1950 The frustration resulting from the frequent irresponsible use of the veto led to various suggestions

(a) Abolish the veto completely and accord equality in voting to all members of the security council

(b) Substitute a qualified unanimity rule for the present absolute unanimity

(c) Restrict the use of veto to clearly defined areas and exclude it from the pacific settlement of disputes and the admission of new members

(d) Alter the fundamental nature of the security council by substituting powers of recommendation for the present enforcement powers

(e) Strengthen further the role of the assembly by giving it enforcement powers

(f) Provide veto power even to non permanent members

Ideologically though any of the suggestions may seem appealing the only suggestion which may be accepted is the one that provides for strengthening of the general assembly For ultimately it is only the security council which has to concur on amendments (UN Charter Articles 108-109) to the charter In dealing with the veto power one fundamental truth must be kept in mind The veto when used reflects the

schism in the relations among the permanent members of the council In the words of Goodrich "it is a symptom rather than the cause of a disunited world" And it is this rift in international relations which must be treated at a multilateral level Short-term solutions aimed at abolishing the veto or extending or limiting its privilege would not serve the cause of democratisation

Weighted Voting in the General Assembly - J F Dulles Proposal An area untouched by controversy is the general assembly where each nation irrespective of its size has one vote While this is undoubtedly democratic, it is often prey to problems of tyranny of numbers J F Dulles proposed a system of two tier voting i.e., every state would have an Assembly vote which reflects the sovereign equality of all states, and gives every state an equal vote, in addition there would be a system of 'weighted voting' so that the result would indicate roughly, a verdict in terms also of ability to play a part in world affairs [Louis 1956: 203-205] While prima facie it may seem undemocratic to introduce weighted voting it must be remembered that if the assembly is to assume greater responsibilities then there should exist some mechanism whereby nations which are themselves unable to assume serious military or financial responsibilities cannot put those responsibilities on other nations [Louis 1956] This proposal has considerable merit for it would fit into the existing organisation without any major alterations and it would enable the assembly

to take on additional responsibilities which it now shares with the security council, i.e., admission of members, appointment of the secretary general, etc [Louis 1956]. Criteria to be used to compute voting strength of states, however, would be difficult to determine and would require considerable thought.

Role of the Secretary General The secretary general, as the single most powerful functionary of the UN, wields considerable influence in the international sphere. It is obvious then that the appointment of such a person must be with reference to the charter provisions. Yet, the charter does not prescribe any qualifications for the post nor are any guidelines provided. This is an omission which must be rectified so as to ensure that the most committed and principled person adorns the post. Suggestions have also been made to select the secretary general for a longer period of 6 to 8 years so as to make the situation conducive for the secretary general to act without fear or favour. The 1992 report of the secretary general, *Agenda for Peace*, also contains suggestions for increasing the powers/authority of the secretary general. This would be quite wholesome for the world community as the UN could stand up against the dictates of the superpowers [Kajin 1993: 6-8].

Problem of Admission to the UN Article 4 of the UN charter provides for admission to membership to be effected by a decision of the general assembly upon the recommendation of the security council.

In the first ten years of the organisation's history the sharp dissent and ill will among the permanent members in the council resulted in a situation where the council refused to admit any states. Each time a state was proposed for admission by the Soviet Union or the United States, it would be perceived by the other as tilting the balance of advantage against its favour and therefore it would veto the proposal. The result was a virtual deadlock and even the move by the assembly to bypass the council and unilaterally admit to membership was curbed by the International Court of Justice [Bowett 1982: 49-51]. It was only in 1955 that the impasse was broken and members were admitted. The opportune end of the cold war further accelerated the process and in 1991, 7 new members were admitted. Though as of date there are 184 members, this behaviour of the council reveals an unhealthy tendency. It indicates unquestionably that if the power equations necessitate it, the permanent members would not hesitate to revert to their earlier undemocratic practices. The entire matter therefore should be left to the general assembly which as a universal body commands greater respect and legitimacy. Since the charter clearly outlines the conditions for membership, it would be an objective determination and so best left to

the assembly rather than the council which would make a 'political judgment'.

Gender Justice in the UN Article 8 emphasises that the UN shall place no restrictions on the eligibility of men and women to participate in any capacity and under conditions of equality in its principal and subsidiary organs.

This provision despite being called 'self evident' and 'superfluous', was introduced at the insistence of women's organisations in the San Francisco conference (1945). Unfortunately today even after nearly 50 years of the charter's existence even the limited promise of Article 8 has not been fulfilled. Though there have been general assembly resolutions targeting participation of women in the UN set-up up to 20 per cent later 25 per cent and 35 per cent by 1995, little has been achieved. The high professional posts continue to be the exclusive domain of the men. Even in agencies like UNICEF few women officials exist. Till 1990 only 4 per cent of the senior management staff of the UN were women. This is a pathetic record for an organisation that pays lip service to equality. The UN has been described today as practising gender racism. The ramifications are mind boggling. If women are not empowered even at this level, gender equal policies will never be made and the equality of sexes will be a mere illusion.

To give true effect to the intention of article 8, the charter must be revised to make explicit the qualifications required for principal posts so that there is little scope for play of gender politics. It is to be noticed that for even the post of the secretary general no qualifications are prescribed. It is not sufficient that such matters be left to the rules of procedure as that would substantially undermine its significance.

CONCLUSION

About 20 years of thought has gone into suggestions for the reform of the UN (since the Special Committee in 1975). Most of the suggestions put forth in this paper towards a stronger and democratic UN have probably been made before. The political will did not exist then and it probably will not exist now to make the requisite changes. The permanent members of the council will be reluctant to sacrifice their privileges for the 'greater good of mankind' and the play of vested interests will invariably cripple the organisation. It is within these confines that any international organisation must work. In the words of Krishna Menon, the leader of the Indian delegation, speaking at the tenth session of the UNGA, "Without unanimity we cannot revise the charter and if there is unanimity, the reasons for revising it will be very small".

It may be perhaps in the present political set-up, impossible to revise the charter so

as to be more reflective of world aspirations. But that does not cast a shadow on the very existence of the UN. The UN has made great strides in its 50 years of existence in the development of a world community and it has even in other respects certainly justified its existence. An analogy used by Brian T. Quahart under secretary general for special political affairs seems appropriate here: "The crime rate in this city is high but that does not lead to a demand for the abolition of the police force. On the contrary it leads to a demand for the improvement of it."

The UN is here to stay and if it did not exist we would have to invent it. The time may not yet be ripe for total restructuring but the changing power equations in international relations will soon pave the way for gradual phased out reforms starting with a re-examination of the charter and leading to a truly universal and democratic United Nations.

Notes

1. The expenses of the organisation shall be borne by the members, is apportioned by the general assembly.
2. Decisions of the assembly on important matters shall be made by a two thirds majority of the members present and voting.

ICICI Bonds. That's safety thrice over.

** Annualized yield, computed @16% p a payable half yearly*

*** Under the Indian Trusts Act, the Bombay Public Trusts Act and the Rajasthan Public Trusts Act*

PUBLIC ISSUE OF 10,00,000 16% UNSECURED, REDEEMABLE BONDS IN THE NATURE OF PROMISSORY NOTES OF RS. 5000/- EACH FOR CASH AT PAR AGGREGATING RS. 500 CRORE WITH A RIGHT TO RETAIN OVERSUBSCRIPTION UP TO RS. 500 CRORE (IN ALL RS. 1000 CRORE)

HIGHLIGHTS

- One of the premier all India development finance institutions in the country
- Assisted over 4 800 companies in various forms for over 12,800 projects involving total disbursements of over Rs 34000 crore
- Uninterrupted dividend payments since 1956 (i.e. from the second year of operations)
- Professional Management: Board of Directors comprises personalities having vast experience in various fields
- Terms of the Issue
Face Value Rs 5000/-

Interest 16 % p a payable half-yearly

Maturity 5 years

- Bond is transferable by endorsement and delivery
- Listing on the Bombay Stock Exchange (BSE) and the National Stock Exchange (NSE)

RISK FACTORS

The present issue of Bonds carries the following normal risks associated with the activities of a development finance institution

- **Project Failures:** Projects financed by the Company may encounter delays in implementation overruns and, in some cases, failure as well

ICICI Bonds. An annualized yield of 16.64%. * Backed by:

- "AAA" CRISIL rating.
- "Public/Approved Security" status**
- The expertise and professionalism of a premier development finance institution.

Which adds up to a triple assurance of safety.

Section 80L benefit available. Permission for NRIs, OCBs and FIIs to invest on repatriable basis (NRIs and OCBs also on non-repatriable basis).

**THE INDUSTRIAL CREDIT AND
INVESTMENT CORPORATION
OF INDIA LIMITED**

Regd. Office: 163, Backbay Reclamation,
Bombay 400 020 Fax 204 6582

- **Interest Rate Risk:** Maturity mismatches between interest rate-sensitive assets and liabilities may expose the Company to interest rate risk.
- **Competition for Business:** As a result of the liberalization of the Indian financial sector the Company expects to face increasing competition.
- **Competition for Resources:** Due to the non-availability of low-cost funds through Government-guaranteed bonds, the Company has to resort to tapping funds from various commercial sources including the capital markets.

CREDIT RATING: CRISIL: AAA

This rating indicates highest safety with regard to timely payment of interest and principal.

Features of Kerala's Economy

E T Mathew

Kerala's Economy: Performance, Problems, Prospects edited by B A Prakash, Sage Publications New Delhi, 1994, pp 418, Rs 375

THE volume under review purports as indicated in the preface to make an assessment of the performance of Kerala's economy and to examine the problems and prospects of the economy during the period from 1956 (when the state was formed) to 1991. While this is admittedly a genuine objective, the justification given for the publication, namely that while a good volume of literature is available on the performance, problems and prospects of the Indian economy, the position regarding studies on regional economies as for example Kerala is extremely different (Preface p 11) does not agree with facts. As is well known there is already a fairly extensive literature on Kerala's economy. In fact, the *E/PW* had devoted three special issues (Nos 35-37) in 1990 to highlight the unique features of the Kerala economy. In addition, a good number of scholarly articles on the same theme have appeared from time to time in *E/PW* and other journals of repute. Be that as it may, the present work is still welcome as it attempts to offer new insights.

Besides the introduction by the editor which seeks to provide an overview of Kerala's economy, the book is divided into five parts, namely: (i) demographic trends, employment and migration; (ii) agriculture and allied activities; (iii) industry and power; (iv) labour, education and trade; and (v) state finances. The volume consists of altogether 20 contributions which by and large encompass all major aspects of Kerala's economy, barring probably employment/unemployment. Of course, there is a brief and rather superficial discussion of this theme in the overview. Probably in an overview this is all that is possible, but even in such a brief account, the total exclusion of any reference to the results of the quinquennial surveys (NSS) on employment and unemployment is a major omission. This inadequacy could have been overcome by adding a separate paper on employment/unemployment to the volume. After all, unemployment, especially that among the educated, is a major problem confronting the state's economy.

The section on demographic trends, employment and migration consists of four contributions. One of the interesting findings by Mridul Eapen in her paper on 'Changing Structure of the Workforce in Kerala' relates

to the fairly rapid growth of non-agricultural employment, especially in the services sector and in non-household manufacturing, in the rural sector. Eapen, however, is not sure about the underlying causes of this change. Is the increase in non-agricultural employment the result of a deliberate attempt at diversification of employment, or is it due to reluctance on the part of the relatively more educated to engage in agricultural work? The paper by P R Gopinathan Nair on migration of Keralites to the Arab world provides many useful insights into the processes, patterns and prospects of migration. It is astonishing that in spite of a let up in the flow of migrants to the Gulf and also a general reduction in the level of emoluments enjoyed by the migrant workers from Kerala returned by their former employers, there has been practically no fall in the remittances received from the Indian expatriates. Nair attributes this to a rise in the savings propensity on the part of the expatriate workers and to a progressive shift in the composition of the workers from less skilled and less educated to more skilled and more highly educated, and from manual workers to technical, ministerial, supervisory and professional employees (p 102). These are indeed much needed changes. However, they go only half way in transforming Kerala's economy. As Nair rightly points out, the emigrants' households spend away bulk of their savings in an unproductive manner. He has, however, refuted the oft-repeated allegation that the emigrants' households invariably go in for construction of palatial buildings and lavish money on marriages, festivals and on purchase of land. It is relieving to hear from Nair that extravagant spending has been attracting only progressively lower proportions of the savings of migrants, particularly since 1983. This trend obviously augurs well for the future of Kerala's economy, especially because there is a strong conviction among observers that the Gulf region holds enormous promises for employment of Keralites in ever increasing numbers for a long time to come. Although all the papers included in this section make interesting reading, one is constrained to point out some factual inaccuracies and misleading propositions. The observation of B A Prakash in his paper on demographic trends in Kerala

that "not much attempt has been made to study demographic changes in Kerala" (p 54) is not borne out by facts. There has been in fact substantial work in this area by well-known researchers like K C Zachariah, Mari Bhat, Irudaya Rajan and several others. Again, referring to the 'negative developments' on the demographic front, he has listed "high density of population, continuous decline in work participation rates, and rapid increase in unemployed educated and non-educated labour force" (p 59). Evidently, there has been a confusion between demographic (social) and economic factors. Actually, in terms of demographic variables (social development), Kerala is getting very close to the developed countries in the world.

Part III of the book, discussing performance and problems of agriculture and allied activities, consists of five contributions, all of which are quite interesting. All of them, however, are not of uniform quality. The opening paper by M A Oommen on 'Land Reforms and Economic Change' is a well-researched as well as well-documented piece. Discussing the distribution of operational holdings based on gini coefficients worked out from the data provided by the Agricultural Census, he has come up with the apparently startling conclusion that Punjab and Kerala have shown a pronounced trend towards concentration in recent years. While in 1980-81 large holdings (above 10 hectares) constituted 0.1 per cent of the operational holdings accounting for 7.2 per cent of the total area, in 1986-87 they formed 0.08 per cent of the holdings accounting for 9.7 per cent of the total area. However, Oommen's attempt to attribute this trend to increasing investment in real estate by Gulf migrants may not be endorsed by all as he has not provided any empirical basis for the inference. Referring to Kerala's performance in terms of agricultural production and productivity, Oommen is candid in admitting that changes in relations of production have not ushered in an era of increased production and productivity. And viewed against the backdrop of adequate flow of credit to the agricultural sector, the continued stagnation of this sector stands out as an enigma. However, one of the hypotheses advanced by Oommen to explain this 'enigma', namely, the shift from food crops to cash crops does not seem to be sufficient to explain agricultural stagnation as such, since agriculture as a category includes both food and non-food crops (perennial crops). At best, this hypothesis can explain only the fall in the production of food crops but not their productivity.

While there is some truth in Oommen's assertion that due to the Gulf impact, land

from being a means of production, has become a prominent commodity in exchange. It cannot be accepted that farmers in general view land as a commodity in exchange only. His proposition applies only to a tiny section who purchase land as an investment and wait for an opportune moment to reap large profits through sale. This phenomenon, in fact, is confined to a few urban centres and not at all to rural areas as a whole where land is, by and large, still held as a means of farm production. The concluding observation by Oommen that "at best land reforms is only a necessary condition and has to be related to the development needs and emerging socio-economic reality" (p 133) cannot meet with any disagreement.

P K Sivanandan has tried to cover a vast area in his paper on performance of agriculture in Kerala. Instead of highlighting the significant growth trends, he has devoted a small section each to all crops, food and non-food and individual crops such as rice, coconut, tapioca and rubber, with the result that the treatment has become too descriptive and the focus of the paper has been lost. Probably a still more serious limitation of the paper is that though the publication was released in 1994, the time frame of the discussion does not extend beyond 1982-83. The last section of the paper, however, has touched upon several relevant issues. For instance, referring to the deceleration in the case of rice and coconut, Sivanandan makes a very pertinent observation that effective and full utilisation of the irrigation potential and improving upon scientific management with increased inputs (as in the case of rubber) may help these crops to recover from the decelerating trend (p 156). If only the author had concentrated on such aspects, the presentation would have been far more fruitful. Unlike in the case of Sivanandan, V Radhakrishnan et al have done well to focus attention on a single crop, namely rice, which is the staple food crop of Kerala. By marshalling all the relevant data on area, production and price, the authors have produced a very scholarly piece. Their conclusion that, though there are many reasons for the falling area and production of rice in Kerala, falling profitability of rice cultivation appears to be the most important among them, is unexceptionable. The article by John Kurien on Kerala's Marine Fisheries Development Experience, included as the last item in Part III of the book, presents an analytically brilliant exposition of a theme relatively little known to professional economists. For the purpose of a detailed analysis of marine fisheries development experience of Kerala, Kurien has divided the period from 1956 to 1989 into three phases. The period 1956-66 formed the 'slow modernisation phase', the thrust was to raise the levels of productivity of fish harvesting

and to improve the methods of fish processing and marketing, thus raising the availability of good quality fish and enhancing the standard of living of the fisherfolk. 'The rapid modernisation phase' from 1967 to 1980 was characterised by a new thrust to fisheries development, namely, an export orientation by introduction of modern technology. This period saw the entry into the marine fishing sector of a new 'owner class' traditionally not involved in it. This owner class cornered a significant share of the value of output. For the vast majority of the traditional fishermen who continued to own and work on the non-mechanised craft, real incomes had registered a sharp fall. At the end of the rapid modernisation phase, thus, Kerala's marine fisheries and the majority of its fishermen were faced with an impasse. During the period 1981 to 1989 described by Kurien as the 'dilemma phase', there took place motorisation of traditional fishing craft throughout the state. Interestingly, in many districts, motorisation gave a big boost to the use of fine-meshed encircling nets called 'ring-seiners' which were nothing but a smaller version of the large and destructive 'purse seine' nets vehemently opposed by the traditional fishermen earlier. Kurien has vividly described how extensive motorisation has necessitated large investments by traditional fishermen and has led to the emergence of new ownership patterns and patterns of sharing the income. The conflict between fishermen using traditional fishing crafts and those using trawlers as well as the fast emerging conflicts among traditional fishermen themselves have yet to find a lasting solution. To Kurien, any resolution of the conflict should aim at adequately protecting the interests of the vast majority of the fish worker population and the fish consumers who depend on the fisheries sector as a source of livelihood and food.

The next section may be considered to form the core of the present volume, not only in terms of the number of papers included but also in view of the importance of the theme discussed, namely, industrialisation of the state. The contributors in this section include researchers such as K K Subrahmanian, P Mohanan Pillai and M M Thampy who have done considerable research on Kerala's industrialisation.

Subrahmanian in his paper on 'Some facets of the manufacturing industry in Kerala' has shown that the growth performance of the manufacturing sector in Kerala has been far below the all India average. The continuing deceleration of this sector in fact poses a paradox against the backdrop of high saving ratio of the state economy and rich human resource endowment. The manufacturing sector in Kerala is dominated by certain traditional industries like food products and

beverages, cotton textiles, and wood products which together account for more than 50 per cent of the total employment in the ASI factory sector. In terms of employment in the ASI factory sector, cashewnut processing (24.2 per cent) followed by manufacture of bidis (7.2 per cent) are the leaders. However, in terms of value added (ASI factory sector), generation and transmission of electrical energy (23.3 per cent) followed by fertiliser (8.2 per cent) lead the rest. Combining the factory and manufacturing sectors, it is observed that the top three performers in terms of employment are cotton (45 per cent), handloom (20 per cent) and ashew (10 per cent). According to Subrahmanian, the 'fragile' base of the manufacturing industry in Kerala is due to the absence of any 'foot-loose' (sun rise) industries like engineering industries. He has also highlighted the fact that the role of small scale units is compared to large scale units is relatively more in Kerala than at the all India level. The share of the large scale sector being relatively small, it is not been possible to provide a diversified manufacturing base which could stimulate technical progress and inter industry linkages. However, Subrahmanian has not attempted any enquiry into the factors that have inhibited the emergence of a diversified manufacturing base. This is probably a major limitation of his analysis. The author has mentioned high cost of production is one of the unfavourable factor in the development of manufacturing industry in Kerala. For example, in 71 out of 49 product groups in the modern manufacture, the cost of production in Kerala is higher than at the all India level. Referring to the relative roles of the central and state governments in promoting rapid industrialisation of the state, Subrahmanian has stressed the fact while central public sector investment is far below the state's share in the country's population, the state public sector consists of too many small units. In either case, private investment is inadequate. There can be no disagreement with the author's concluding observation that Kerala cannot industrialise along the conventional line and that the priority shall be on developing 'sun rise' industries producing skill intensive, technology based and high value added items.

The paper by Mohanan Pillai on the performance of state sector manufacturing enterprises in Kerala has supplemented the contribution of Subrahmanian by attempting to identify and analyse the weaknesses of state enterprises. He would consider that the major weakness of state enterprises is organisational. Hence he has made a number of appropriate suggestions to tune up the organisational structure. In his paper on 'Development of Organised Small Industries: Some Issues', M M Thampy has undertaken an in-depth study of the small scale industries.

sector of Kerala. In the first part of the paper he has examined the wage-cost component and has come to the conclusion that Kerala's small-scale sector is characterised by lower labour productivity and higher wages as compared to all-India. In the second part he has examined the 'psychic costs' – a relatively novel concept – involved in locational decisions regarding small-industry units.

He points out that these decisions are not made on the basis of a strict calculus of costs and returns. Entrepreneurs may often look for peaceful industrial atmosphere instead of high profits. Thampy feels that such considerations are more relevant in the case of small-scale industries. The existing labour unrest in the state's industrial sector has created a mistrust in the minds of the investing class. He has, however, admitted that there are factors other than high wage costs and psychic costs that have stood in the way of industrial investments in the state.

Among the essays included in Section V, those on 'Trade Unionism in Kerala' by K Ramachandran Nair and 'The Trend and Pattern of Trade of Kerala' by T M Thomas Isaac deserve special mention. Nair's assessment of trade unionism in Kerala is candid and realistic. His observation that there are two kinds of leaders in Kerala's trade union movement, namely, leaders with primary interest in the movement and leaders with primary interest in politics is pertinent. It is because of the intervention of the latter that political issues are drawn into industrial relations. This tendency is to some extent nullified by the fact that Kerala has succeeded in establishing a healthy and constructive institutional framework for prevention and settlement of industrial disputes. The discussion on the whole is balanced and dispassionate; the earlier historical section, however, could have been made brief. Isaac's paper on external trade of Kerala is an original contribution which throws much light on little known aspects of Kerala's trade. He has presented an exhaustively informative and analytical treatment of Kerala's exports consisting of cashew and marine products, coir, spices, tea and coffee, interstate exports consisting of rubber and coconut, and imports from foreign countries as well as interstate. Isaac's paper has helped demolish several popular perceptions regarding Kerala's foreign trade. Throughout the post-independence period, interstate trade of Kerala has been gaining more importance than foreign trade and presently foreign trade of Kerala forms less than 25 per cent of the total external trade. Further he has shown that nearly 90 per cent of Kerala's foreign exports consists of final products and not primary raw materials as commonly perceived. In a way it is paradoxical that the products of two major commercial crops,

namely, coconut and rubber are entirely traded within India while only a very negligible proportion of the cashew and marine products from Kerala are marketed within India.

The essay on 'Trends in Kerala State Finances' by K K George though listed as the last entry in the volume (forming a separate section on state finances) is by all means one of the foremost contributions. The crux of the financial crisis the state has been passing through in recent years consists in the compulsion to carve out a surplus in its capital account in order to finance, at least partly, its recurrent revenue deficit. George has traced the fiscal crisis to the inadequate provisions made by the Eighth Finance Commission (1984-89). Generally, the Finance Commissions' forecasts of non-plan expenditures of the state government particularly those relating to increases in expenditure on account of upgradation of emoluments have been far below the actuals. According to him, the achievements of the state in meeting selected national objectives in the fields of education and health care have been used by the Finance Commissions to deny not only upgradation and special

problems grants, but also its legitimate tax shares under devolution formulae. While the tax efforts of the state as evidenced by the elasticity of tax revenue have been commendable (the state had the highest elasticity among 15 major states during 1970-71 to 1985-86), the share of the state's non-tax revenue, especially interest receipts and receipts for economic services, in total 'own' revenue has been lower than that of all the states in most years. At the heart of the problem of the recurring financial crisis in the state is the fact that its per capita revenue expenditure is higher than that of all the other states while its per capita capital expenditure has always been lower. To make matters still worse, the revenue content of developmental expenditure also has been higher in the state compared to the rest of the country.

Notwithstanding the fact that there is a certain amount of duplication and overlap, this volume of essays is a welcome addition to the existing literature on Kerala's economy. The readability of the book, however, could have been greatly improved by more careful and thorough proofreading and by proper editing.

Towards Genuine Local Government

Jose George

Decentralisation: Panchayats in the Nineties edited by Amitava Mukherjee; Vikas Publishing House, New Delhi, 1994; pp xviii + 298, Rs 450.

A LOT of literature has come out on the historic 73rd and 74th constitutional amendments to give constitutional backing to the third stratum of administration. The book under review edited by Amitava Mukherjee is the outcome of a national seminar on panchayats held at the National Academy of Administration, Mussoorie, from July 22-25, 1993 "where several experts, who either live their lives with the joys and sorrows of panchayats or who have soiled their hands in a bid to instil life, in their own way, into these institutions, assembled, debated and deliberated upon what the agenda for the panchayats in the 1990s would be" (p x).

The 15 articles in the volume are organised into five sections, namely, Political Issues, Resources, Functions of Panchayats, Institutional and Personnel Issues and Lessons from Experience. Under the section on Political Issues, the first article by M Shiviah deals with systems and measures to enhance accountability in panchayati raj administration. Though Shiviah mentions several measures like planning, committee system, guidelines by government management

system, etc., it seems he has not taken into consideration the role of constant vigilance by the people to protect any democratic institution.

The article by T L Satish Chandran deals with inter-tier allocation of functions and V Ramachandran's article mentions the salient features of the 73rd constitutional amendment with the help of a SWOT (Strength, Weakness, Opportunity and Threats) analysis of panchayati raj institutions in the country.

The section of resources covers financial, human and land resources along with arrangements for scientific and technical management and other expertise support systems. N C Saxena mentions the potential of joint forest management all over India with the help of community-based forest protection committees, as successfully implemented in West Bengal. J M Girglani mentions that the essence of local self-government lies in the freedom the local self-government institutions enjoy in selecting their own course of development and the availability of their own sources of finance to pursue the same (p 67).

The training module for trainers and the core-planning team of districts mentioned in the article by V K Agnihotri, Sudhir Krishna and Amitava Mukherjee is useful for the concerned people. The write-up under the title land as the vital resource with panchayats gives valuable data on the current situation of land reforms in the country and the progress made by different state governments in distributing government wasteland for cultivation and homestead purposes to weaker sections.

L C Jain and Amitava Mukherjee have contributed an article each to the third section on Functions of Panchayats. Jain has emphasised the necessity to reorient and restructure the planning process and state level departments and agencies consequent on the 73rd constitutional amendment. According to Jain it is necessary to create conditions for the formulation of area plans by panchayats starting from village level and for the integration of these village area plans at panchayat samiti and zilla levels (p 132). Amitava Mukherjee in his article emphasises the need for creation and maintenance of alternative data bases for panchayati raj institutions. Detailed classification and listing of the data requirement at village level for micro level planning mentioned by Mukherjee is a useful guideline for the panchayati raj functionaries at the grass roots level.

Two articles are included in the fourth section on Institutional and Personnel Issues. Sudhir Krishna in his article gives details of the government departments to be brought under the panchayati raj institutions. He is of the opinion that mere rules and procedures would not facilitate empowerment of the people. A healthy respect for the process of democratic decentralisation among the political executive and bureaucracy alike would be of the essence (p 199). S S Moenakshisundaram warns that the creation of panchayati raj institutions at village, intermediate and zilla level is definitely going to create some problems with regard to the posting, transfer and allegiance of civil servants at the district level. One solution suggested by him is the constitution of a panchayati raj services board to recruit and manage all the local government employees.

In the last section on 'Lessons from Experience' V R S Cowlagi and S S Mehta has given a report on the Gujarat experience and Nirmal Mukherjee and D Bandyopadhyay on West Bengal. Gujarat introduced an innovative scheme of decentralised planning in November 1980 operated through district planning boards. Probably the most useful and well written paper in the volume is the one titled 'New horizons for West Bengal Panchayats' by Nirmal Mukherjee and D Bandyopadhyay. It is an adaptation of the authors' 'Report

on Functioning of Panchayats in West Bengal' prepared for the government of West Bengal. According to the authors panchayats in West Bengal are the first in the earlier generation of panchayats in which since 1978 political parties have openly participated in elections held regularly every five years and so they have now endured long enough to be treated as essential components of a new system of governance. The Left Front government embarked upon a programme of rural resurgence through panchayats and land reforms. According to the authors, more than their achievement in the spheres of land reforms and rural development panchayats 'have brought about a churning of the submerged humanity in the rural areas and created a high degree of social and political awareness among all sections' (p 216). However, even in West Bengal where panchayati raj institutions are reported to be functioning relatively well the authors complain that the state government has not felt any compulsion to reduce either its functions or its staff and so the claim that the panchayats have a degree of autonomy is not sustainable. The authors suggest that in the context of West Bengal land reform measures still have their validity and the next stage could be a statewide move for the consolidation of the plots of actual tillers of the soil — small farmers, patta holders and recorded bargadars.

In the last article of the volume Amitava Mukherjee has dealt with the steps to implement the 73rd constitutional amendment act both in letter and in spirit and the resolution of three conflicts, namely those between state level and national level legislators on the one hand and the local level politicians on the other, between the politicians and the bureaucracy and between

vested interests and the local level institutions.

This comprehensive work on decentralisation through panchayati raj is definitely an important addition to the existing literature on the subject. Those who are concerned with the policies and programmes of devolution of power and of local self-government would find it very useful. However, one can identify some inadequacies. It will not be an exaggeration if one sees it as a volume of bureaucrats, for bureaucrats and by bureaucrats. Most of the contributions, with the exception of a few, are by serving or retired civil servants or those who are from institutions directly controlled or sponsored by state or union governments. Probably on account of their training and self imposed restraint on expressing opinions contrary to the liking of the establishment the authors might have found it more convenient to deal with procedures and planning and the legal implications of the constitutional provisions. Absence of contributions by scholar activists and conscientious academicians and social scientists who can afford to be critical can be mentioned as a deficiency. Discussion of the emerging philosophy and politics of panchayati raj and pragmatic suggestions by grass roots activists and widening of the available data based on their personal experience would have gone a long way in enriching the volume. A detailed and systematic introduction on the topics by the editor at the beginning and a detailed bibliography and index at the end would also have enhanced the usefulness of the volume as a reference manual. The price of the book is also high and keeps it beyond the reach of individuals. Perhaps these points could be taken into account while bringing out the next edition of the volume, preferably a paperback one.

NEW BOOK FROM

MD

PUBLISHERS OF THE
HUMANITIES, NATURAL
& SOCIAL SCIENCE

CHANGING FAMILY ROLES AND FEMINISM

- Edited by

Man Singh Das and Vijay Kumar Gupta

1996, 145p, ref, tables, 25x16cm
ISBN 81-85880-92-1

Rs 300.00

The book tells us about the attitudinal changes in the society with the increase in literacy level among the women. They are contributing to the workforce and are becoming economically independent.

HUMAN RESOURCES DEVELOPMENT

Experiences, Interventions, Strategies

T V RAO

This important book is based on the premise that HRD is crucial for achieving sustainable development and for alleviating poverty and that governments must, therefore, accord the highest priority to this area. Utilising the experience of both developing and developed nations, Dr Rao identifies critical areas and important target groups for HRD interventions and discusses various approaches for developing human resources at the national level. He highlights the interdependent and interrelated nature of HRD variables, strategies and processes, and argues for an integrated and coordinated approach while also exploring evidence linking HRD variables with economic development variables

1996 ■ 392 pages ■ Rs 525 (cloth) ■ Rs 325 (paper)

This work provides an alternative approach to the study of co-operatives and presents a new theory, based on empirical evidence, to explain why co-operatives and village organisations succeed or fail. The author's primary purpose is to evolve and test a new theoretical framework in order to understand the working and performance of a village co-operative, or any other local organisation, by treating it as a live entity embedded in a particular social context.

Diary of a Decade of Agony

Avinash Dharmadhikari

Translated by Gauri Deshpande

HB Rs 375.00

PB Rs 230.00

Diary of a Decade of Agony is a translation of Marathi original *Aswastha Dashakachi Diari*. The book is an Indian Panorama with the various people the author encountered in his travels — from peasants in cyclone-hit Andhra Pradesh, to student leaders in Assam, to dissidents in Punjab and Kashmir, Anti-Reservationists in Gujarat to fundamentalists in Aligarh and Ayodhya.

Particularly notable are the author's thoughts and comments and musings of every encounter he describes. This gives the reader a sense of being swept up and involved in the lives of India's millions.

The author was a student of Jnana Prabodhini, a renowned educational institution in Pune and later worked as a volunteer for the same institution for 10 years, he simultaneously garnered a B.Com an M.A. and later an M.Phil in History. He also worked as a freelance journalist in Pune.

Avinash Dharmadhikari joined Indian Administrative Service (IAS) in 1986. At present he is the Deputy Secretary to the Chief Minister of Maharashtra

A must for anyone keen on contemporary Indian socio-political issues.

Structural Adjustment in India

A Critical Assessment

Ashwini Deshpande
Prabirjit Sarkar

This paper examines trends in broad macro aggregates like exports, imports, industrial production, inflation and external debt in order to assess the impact of the structural adjustment programme in India at work since July 1991. Using monthly data since 1980, our results indicate that exports, imports and the balance of trade are following a long-term trend which has been unaffected by the two doses of devaluation in 1991. This leads us to question the utility of devaluation as a corrective mechanism for achieving a desired trade balance. At the same time, indications are that devaluation would worsen the debt burden, ceteris paribus. Thus the BOP deficits are unsustainable as they are accompanied neither by improved net export earnings nor by easier external finance. There is also some indication of stagnation in industrial production and acceleration in inflation since 1991.

I Introduction

IT is commonly believed that the New Economic Policy (NEP) in India started in July 1991 as a response to the external debt and foreign exchange crisis. It has been argued that the NEP, in the sense of a departure from the post-independence model of planned development, actually can be traced back to the mid-late 1980s. However, it is equally true that it was only as a response to the 1991 crisis that the IMF World Bank advocated Structural Adjustment Programme (SAP) began in full earnest and the process that had begun in the mid 1980s unfolded itself in its myriad facets. Thus it would not be unreasonable to regard July 1991 as the starting point of the structural adjustment and stabilisation programme,¹ constituting reforms which are broadly summed up in the phrase, the New Economic Policy.

Liberalisation and reform in India has been the subject of much interest and speculation [see, for instance, Sen and Das 1992, Basu 1993, Joshi and Little 1994, Sen 1994, Sengupta 1995] and so far most of the work rests on assertions. The working of the SAP in other developing countries has been studied extensively [Payer 1974, Pool and Stamos 1985, Sachs 1986, Cooper 1989, George 1989, Chossudovsky 1992 to mention just a few works] mainly reflecting the much longer time period for which the SAP has been in operation there. In India any comment on the SAP is dismissed as invalid on the ground that the time period for its operation has been too short, amongst other things. However, given that the country is in the fifth year of its operation, we feel that it is time to take stock of at least certain major trends in the economy. Also, the relatively short time span has not stopped

the enthusiasts of the SAP from making tall claims of success on broad macro aggregates. The aim of this paper is precisely an examination of these claims.

One of the important aims of the SAP in India has been the control of inflation, as in other target countries. This and other accompanying measures such as trade liberalisation, devaluation, privatisation and a cut back in government expenditure are supposed to boost growth of industrial production and exports and thus pull the economy out of stagnation and recession. A subsidiary albeit important benefit expected from this process is a reduction in the debt burden, as it is believed that the spurt in exports due to devaluation would generate the necessary repayment capacity immediately to relieve the debt overhang and reduce the need for borrowing in the long term.

All of these claims are controversial since the IMF dictated SAP has common ingredients in all the target countries; these have been challenged the world over. The issues involved in the debate are several, ranging from the feasibility of ensuring price reform to specifically the role of each of the measures that the IMF proposes, to larger questions of state versus the market and the possibility of benefits of free market development reaching the majority of the population. It is not our intention to repeat this debate in its entirety, with India as merely the starting point. Even the staunchest defenders of the SAP admit there are costs associated with the kind of austerity inherent in the programme and the poorest are more often than not the worst hit. There is no reason to believe that India would be an exception in this regard, especially as the much-touted safety net has not gotten off the ground. Thus taking the adverse impact

on the poor as given, our focus in this paper is to examine certain broad macro-economic indicators which give a glimpse of the state of the economy.

II Indian Economy under NEP: Trade and Production Scenario

The crucial question that is sought to be answered in this section is: has there been any change in the balance of trade scenario under the NEP? In a recent study, Sarkar (1995) argued on the basis of monthly data that the trend growth of India's exports and imports (dollar values) during the NEP years, 1991-94, is actually a continuation of the trend of the pre-NEP years, 1988-91.

This analysis can be carried further by taking into account a longer period 1980-94. Data sources are the same as in the Sarkar (1995) study: IMF, International Financial Statistics (various issues). Monthly data on dollar values of exports and imports have been assembled over January 1980 to July 1994. For seasonal corrections, seasonal dummies are used. In order to cure autocorrelated errors, the maximum likelihood procedure has been used.² A log-linear trend has been fitted to the series of India's exports and imports; intercept and slope dummies (ID, SD) are added to the trend equation to examine the impact of the NEP regime since July 1991 on the trend-growth in the dollar values of India's exports and imports.

Our estimate shows that the dollar values of India's exports (XDL) rose at the rate of 0.8 per cent per month while the dollar values of India's imports (MDL) rose at the rate of 0.5 per cent per month during January 1980 and June 1991. These trends continued during the NEP years without any structural

shift - no acceleration in the growth of exports and no deceleration in the growth of imports since July 1991. The balance of trade (in US dollars) - BOT - did not show any trend-growth in the pre-NEP years; the situation did not change during the NEP period:

$$\begin{aligned}\log(XDL) &= 6.13 + 0.008t - 0.02D + 0.002SD \\ &\quad (119.71) (13.9) (-0.04) (0.04) \\ \text{Adj R SQ} &= 0.94, DW = 2.05 (1) \\ \log(MDL) &= 6.81 + 0.005t - 0.04D + 0.002SD \\ &\quad (181.34) (11.06) (-0.72) (0.56) \\ \text{Adj R SQ} &= 0.76, DW = 1.97 (2) \\ BOT &= -527.02 + 0.8t - 57.82D - 01.80SD \\ &\quad (-11.43) (1.42) (-0.09) (0.46) \\ \text{Adj R SQ} &= 0.43, DW = 2.00 (3)\end{aligned}$$

where t = time, D , intercept dummy = 1 for the period, July 1991 and July 1994 and = 0 otherwise; SD , slope dummy = $D.t$. (t -ratios are in parentheses; estimates of seasonal dummies are skipped)

In view of arbitrary choice of break points in the dummy variable analysis, Sarkar (1995) used CUSUM Squares test and found no evidence of break anywhere in the series of India's exports and imports during 1991-94. This test is repeated here for a longer period, 1980-94 and it confirm the earlier study.⁴

Thus, in spite of two doses of devaluation in July 1991 and another 20 per cent devaluation in March 1993 through abolition of dual exchange rates, India's exports did not accelerate and the balance of trade situation did not show any sign of improvement. Thus, so far there is no evidence of devaluation bringing about an improvement on the balance of trade front, that was expected as one of the first successes of the NEP. This result also provides circumstantial evidence in support of the view of Sarkar (1992, 1994a,b and 1995) that the exchange rate behaviour has no influence on India's balance of trade.⁵

Next, let us consider the scenario of industrial production. Using the monthly data on the index of industrial production (IIP) over the period January 1980 - April 1994, the monthly rate of growth has been estimated to be 0.58 per cent. There is no evidence of acceleration in the trend-growth path under NEP; in fact, there is weak evidence of deceleration in industrial production:

$$\begin{aligned}\log(IIP) &= 4.56 + 0.0058t + 0.52D - 0.004SD \\ &\quad (120.84) (12.6) (1.19) (-1.27) \\ \text{Adj R SQ} &= 0.96, DW = 2.05 (4) \\ \text{where } t &= \text{time, } D, \text{ intercept dummy} = 1 \text{ for the period, July 1991 - July 1994 and} = 0 \text{ otherwise; } SD, \text{ slope dummy} = D.t. \\ &(\text{t-ratios are in parentheses; estimates of seasonal dummies are skipped}).\end{aligned}$$

The dummy variable analysis has been supplemented by the CUSUM Squares test. There was no evidence of structural break anywhere in the series over the period 1991-94.⁶

To place these results in the context of the empirical work being done for other countries, note that a statistical study of 93 countries of the growth-oriented adjustment programme [Faini et al 1990] suggests that after controlling for external factors and for initial conditions, growth is not higher in countries recipient of IMF-World Bank funding, but that investment is significantly lower than non-recipient countries.

III

Is Inflation under Control?

The SAP proceeds with the assumption that inflation is caused by demand pull factors and a tight monetary and credit policy is all that is needed to reduce the inflationary potential of the reform measures. This approach has been responsible for a curtailment in the size of the monetised deficit in the post-reform period, yet inflation has persisted and in fact, has accelerated. This evidence leads us to suggest that the understanding of the SAP about inflation may be flawed. Pandit (1993) has argued that inflation in India is more the cost push variety, contrary to the Fund/Bank view.

We examined monthly data on the index of wholesale prices (WPI), over the period January 1980 to April 1994. This series exhibited a trend-growth of 0.6 per cent per month during the pre-NEP period (January 1980 to June 1991), with a strong evidence of acceleration during the NEP years (starting July 1991).

$$\begin{aligned}\log(WPI) &= 4.55 + 0.006t - 0.32D + 0.002SD \\ &\quad (252.08) (28.1) (-1.99) (2.23) \\ \text{Adj R SQ} &= 0.99, DW = 2.13 (5) \\ \text{where } t &= \text{time, } D, \text{ the intercept dummy} = 1 \text{ for the period July 1991 July 1994 and} = 0 \text{ otherwise; } SD, \text{ slope dummy} = D.t. \\ &(\text{t-ratios are in parentheses; estimates of seasonal dummies are skipped}).\end{aligned}$$

The implication of this is that measures of the government, ostensibly for inflation control, would not only be ineffective, but also may have certain other undesirable effects. For instance, in countries like India, where credit finances more investment than consumption, a rise in interest rates as a means of inflation control may lead to a dampening of investment, with serious repercussions on future growth prospects.

ERF (1995) spells out the inflationary trends in the various sectors of the economy,

thus exploding the myth of inflation control. It has been demonstrated that the annual price increase in the last four years has been around 10.5 per cent to 11 per cent. These price increases have been widespread and substantial. Among the major subgroups of primary articles, the increases during the period end-March 1991 to December 17, 1994 ranged from 42 per cent to 93 per cent. This is despite the unprecedented seven good consecutive monsoons that India has enjoyed. The ERF (1995) has identified several factors that are a direct fallout of the SAP, that have contributed to inflation. Regarding many primary commodities, an aggressive export promotion has pushed up their prices in the domestic market. For fertiliser, electricity and coal, a reduction in subsidies has contributed to a rise in their prices. Decontrol of prices as a part of the SAP have also led to a rise, for example, in the case of cement.

Corroborating somewhat the view that inflation is more due to cost push factors, the ERF study pinpoints the rise in procurement and support prices as a major determinant of inflation in agricultural commodities. Thus, the increase in issue prices have been even more substantial, in keeping with the line of reducing subsidies. Also, with the government committed to controlling the fiscal deficit, and unwilling to raise taxes, increase in administered prices has been an annual feature, which given the nature of commodities, has a multiplier effect on inflation.

IV

External Debt Scenario^a

Since a crisis of external debt repayment is supposed to have sparked off the SAP, an examination of the debt situation is in order. Through the 1980s, the government has been steadily increasing its reliance on external borrowing. India's external debt expanded at a rate of more than 15 per cent per annum during the 1980s. The outstanding debt doubled from \$ 20.6 bn in 1980 to \$ 41 bn in 1985, and then doubled again in the next five years to \$ 82 bn by 1990. The total external debt as a percentage of the country's GNP increased from 11.9 per cent in 1980 to 28.1 per cent in 1990. At \$ 91.78 bn, India carried the third largest debt in the developing world in 1993 [CMIE 1995].

As the composition of India's debt changed with short-term and high cost debt getting

TABLE 1: AVERAGE TERMS OF NEW COMMITMENTS (FOR ALL CREDITORS)

	1970	1980	1985	1986	1987	1988	1989	1990	1991
Interest (per cent)	2.5	5.5	5.8	5.7	5.2	6.2	5.5	5.3	5.6
Maturity (years)	34.0	33.5	25.6	20.2	23.7	20.3	19.7	25.7	20.0
Grace period (years)	8.2	7.1	6.3	6.1	6.8	6.4	5.7	11.7	6.3
Grant element (per cent)	60.8	44.8	32.5	28.9	34.9	27.4	30.4	37.3	32.3

Source: World Debt Tables, 1993-94.

a larger share in the total outstanding debt, debt servicing costs escalated substantially. Total debt service grew by 30 per cent in 1982 and 1983 and then by 52 per cent in 1986. In a short span of 6 years, the total debt servicing multiplied 3.7 times. In the same period, exports of goods and services barely increased by 9 per cent. As a result the debt service ratio increased sharply from 9.3 in 1980 to a record 32 in 1986. It thereafter declined slightly but is still quite high compared to other indebted countries. In 1993 it was 29 per cent.⁹

The enhanced debt burden is largely attributable to the relatively harder terms at which debt is forthcoming. Thus concessional debt as a percentage of the total external debt has fallen from 75.1 per cent in 1980 to 42 per cent in 1992 [WDT 1993:94]. A look at Table 1 shows that while the interest rate for all creditors remains more or less the same through the 1980s, the maturity period has shortened considerably from 33.5 years in 1980 to 20 years in 1991. Over the period the grant element has declined from 44.8 per cent to 32.3 per cent.

This has resulted in a decline in the net transfers on debt¹ (Table 2) which rose through the 1980s up to 1988 but have been falling subsequently and in 1992 are only half the amount in 1985. The table also shows that this trend is mainly due to the negative transfers on debt due to private creditors.¹¹

Some discussion of devaluation is in order here. The empirical results in the previous section indicate that devaluation has not had any significant impact on either exports or imports. Indeed radical changes in the nature of both exports and imports would be needed to achieve that, changes that would not be brought about merely by price reform. Now, in the context of debt repayment it appears that a devaluation would actually worsen the repayment burden *ceteris paribus* as the currency composition of long-term debt indicates that about half of India's debt (48.7 per cent in 1992 according to WDT 1993:94) is in US dollars. The implicit assumption behind this suggestion is, of course, that no additional repayment capacity would be created by devaluation which we have strong reasons to believe.¹²

To understand the real factors behind accumulation of debt the most important

indicator is the BOP account. Overall a deficit would indicate that a country needs finance. However if net exports or invisible are likely to rise the need for borrowing is that much reduced. Even if that is unlikely we shall call these deficits sustainable if external assistance is easily forthcoming and at terms that keeps debt service within prudent limits. We have seen above that both these conditions are violated in that the availability of external finance is reduced and the terms have become harder.¹³ This is true not only for India, but for most of the indebted developing countries. At the international level this trend is unlikely to be reversed in the medium term as the bank's experience of high exposure to LDC debt is still too fresh for them to repeat their follies. Also the long term trends in exports and imports reported in the previous section and no suggestion of a substantial change in trade deficits together point towards a reduction in the element of sustainability if anything.

However despite the rapid deterioration of the debt situation which resulted in India's climb from a country with no serious debt problems (according to the World Bank classification) in 1988 to the third largest debtor among the developing countries by 1991 it is not clear that the government has devised a strategy to deal with debt crisis. The current approach of the government is largely to tackle the pressing immediate problems on the external debt front more as ad hoc solutions which may not necessarily bind into a strategy.¹⁴ The SAP notwithstanding. The government is proceeding with the premise that standard textbook formulae would work. Setting aside the uncomfortable question of the possibility of being able to achieve a market clearing rate, we have seen that a devaluation has so far not actually worked in the expected fashion. In addition it would only exacerbate the repayment burden. So far there seems to be no indication of a change in any of these trends.

V

Concluding Remarks

This paper was an attempt at examining the trends in certain broad macro aggregates of the Indian Economy since July 1991.

TABLE 2 NET TRANSFERS ON DEBT

	1970	1980	1985	1986	1987	1988	1989	1990	1991	1992

Source: World Debt Tables 1993-94

which can be regarded as the beginning of a structural adjustment programme (SAP). For this monthly data on exports, imports, index of industrial production, consumer price index, wholesale price index and yearly data on external debt was used for the period 1980-1994. Our results indicate a stagnation in industrial production and an acceleration in inflation since the start of the SAP. In addition despite substantial devaluation, the trend in exports, imports and hence the trade balance remains unchanged since 1980. This leads us to question the utility of devaluation as an instrument of export promotion *ceteris paribus* and also indicates that perhaps the causes of export stagnation have more to do with factors in the real economy rather than with failure to reach a illusory market clearing exchange rate.

While devaluation has not contributed to an improvement of the trade balance it would certainly worsen the debt repayment problem contributing to the exacerbation of the debt overhang. Since the 1980s India has had consistent BOP deficits which can be termed unsustainable as they are accompanied with neither an improvement in net export earnings and/or remittances nor with easier external finance. Since the outbreak of the debt crisis in 1982 international commercial banks have consciously tried to reduce their exposure to LDC debt as a result of which availability of credit has gone down and the terms have become harder. India is amongst the many victims of this development and now commercial credits available at harder terms and official credit would only come with greater conditionality.

Since this paper is concerned with examining the effect of precisely such conditionality on the Indian economy we can see the operation of a vicious circle. The external debt problem which reflects a problem in the real sector of the economy, should ideally be settled with greater export earnings. Since that is not forthcoming the country gets into the trap of greater borrowing in order to repay its past debt. Greater amounts of official credit comes with conditionality, one recommendation of which is devaluation, which is likely to worsen the debt problem, as the paper has argued. In addition if the economy is going to be saddled with a stagflation we can conclude that an

alternative approach¹⁵ to get the economy out of its present predicament may be needed.

Notes

[Funding and infrastructural support for the preparation of this paper was provided by the Centre for Development Economics, Delhi School of Economics. We would like to thank K L Krishna for comments and Tirtha Pratim Dhar for research assistance.]

- 1 It needs to be noted that stabilisation and structural adjustment are two distinct programmes, and if the macro-economic imbalances are believed to be transitory, stabilisation policies could be introduced without necessarily going in for structural adjustment. However, in many economies, including the Indian one at the present juncture, stabilisation and structural adjustment are attempted simultaneously, which is reflected in the implementation of a policy package designed to serve both purposes.
- 2 To what extent does the safety net actually mitigate the adverse impact on the poor is a moot question; a separate paper is required to do justice to that debate.
- 3 An appropriate error process has been chosen on the basis of log-likelihood ratio tests. For details see Sarkar (1995).
- 4 Here we find some evidence of break in the trend-growth path between July 1987 and June 1991. This is not confirmed by our dummy variable analysis (t-ratios of both intercept and slope dummies are very low).
- 5 Studies of similar nature for other developing countries indicate that at best, devaluation has a weak favourable impact on trade flows, and in countries where this weak response is found, it is also seen that "the apparent response of trade flows to price incentives would not have taken place in the absence of prior or concurrent public interventions such as investment programmes" [Taylor 1988]. For countries such as Kenya, Philippines, Mexico, Egypt, Chile and so on, devaluation has had a weak or perverse effect on trade balance [Taylor 1988].
- 6 It should be noted that the coverage of the IIP is limited, so it is not the most comprehensive measure of industrial production available. But this is the most updated monthly series, other series with wider coverage are available with a lag of two years. Thus, for analysing current trends, the IIP is the only measure that can be used. We owe this point to K L Krishna.
- 7 There was some evidence of structural instability during July 1983-December 1986. Use of intercept and slope dummies confirms this instability - industrial growth rate declined during this period.
- 8 Traditionally, the composition and size of India's external debt has been a matter of controversy, as the estimates of the government of India, the Reserve Bank of India, and the various international agencies have been widely divergent. In December 1991, the Reserve Bank of India constituted a Task Force and a Policy Group on the external debt statistics of India, which tried to rectify this situation by identifying the sources of discrepancy. The result is that the differences have been considerably narrowed.

The Indian Council for Research on International Economic Relations (ICRIER), New Delhi, a research organisation specialising in International Economics and related areas,

invites applications for the following posts on fixed term appointment and will be extended upon mutual agreement on the basis of the performance.

Starting Basic Salary

Three Professorial appointments one of the for the Chair	UGC grade of a professor alongwith Central Government Government D.A., HRA & CCA, applicable for Delhi and other perks.
funded by :	The Reserve Bank of India
Adjunct Professor	4500-150-5700-EB-200-6300
Fellow	3000-100-3500-125-5000
Research Assistant	1600-50-2300-EB-60-2660
System Analyst	1640-60-2600-EB-75-2900
Accountant	2200-75-2800-EB-100-4000

Higher basic salary can be offered to deserving candidate with higher qualifications and outstanding performance.

1. **Professor** : The candidate should be Ph.D or equivalent in Economics with at least 15 years research/teaching and other relevant work experience and outstanding publications.
2. **Adjunct Professor and Fellow** : Ph.D. or equivalent in Economics with at least 6 years experience.
3. **Research Assistant** : Master Degree in Economics or related subjects.
4. **System Analyst** : M.Sc. with Computer Science with at least two years experience in reputed organisation.
5. **Accountant** : Minimum qualification B.Com. with proficiency in Accounts with at least ten years experience in a similar organisation or with reputed firms.

Preference will be given to candidates with strong quantitative background. Please apply in confidence to the Director, ICRIER, India, Habitat Centre, East Court, 4th Floor, Lodi Road, New Delhi-110 003 within 15 days enclosing a copy of the biodata with two references. The Selection Committee reserves the right to consider candidates who are not formal applicants.

ULTIMATE

down, complete elimination is not possible on account of the fact that the estimates of the international agencies themselves are divergent something that the Indian authorities can do very little about. Thus after the re-estimation by the Task Force in December 1991 India's external debt as reported by the government of India was US \$ 67 034 million. According to the IMF it was \$ 68 784 million and the World Bank Debt Tables reported it at \$ 70 115 million [CMIE 1995].

- 9 The Gulf crisis in 1990 ignited the debt bomb as far as India is concerned. Supplies of essential imports were disrupted and the cost of POL imports increased by 72 per cent increasing the trade deficit by Rs 4.4 billion. In view of this some international agencies lowered India's credit rating restricting her access to the global credit market. This drying up of international commercial credit occurred at a time when concessional credit was not available and the Gulf crisis had already affected the country's foreign exchange reserves.

The foreign exchange crunch was so severe that even after using the reserve tranche position in the IMF amounting to SDR 487.26 million from July to September 1990 the external payments situation did not stabilise. Reserves declined to \$ 1.2 bn on December 31, 1990 equal to about two weeks of imports. On January 18, 1991 the government was forced to borrow again from the IMF this time SDR 1.23 bn [CMIE 1995 and Swamy 1995].

- 10 The net transfers on external debt are defined as follows: Net flows minus interest payments (on disbursements minus debt service payments) where net flows in turn are defined as disbursements on long term debt and IMF purchases minus principal repayments on long term debt and IMF repurchases. This definition is valid till 1984. Beginning from 1985 this line includes the change in stocks of short term debt (including interest arrears for long term debt). Thus if the change in stock is positive a disbursement is assumed to have taken place; if negative a repayment is assumed to have taken place. [WIDT 1993-94].

- 11 The indebted countries as a group have been facing this perverse phenomenon of negative transfers since 1982 which not only adds to the real burden of the debt overhang but also defies all types of economic logic [Deshpande 1995a]. This is also reminiscent of the famous Keynes-Ohlin controversy [for details see Sarkar 1991].

- 12 The experience of other severely indebted countries indicates that devaluation manages to achieve substantial swings in the current account balance but these swings are more on account of import cuts rather than export expansion contrary to textbook prescriptions. As imported intermediates are crucial for maintaining rates of investment this has been one of the factors responsible for a decline in rates of investment in countries with a debt overhang [for an elaboration see Deshpande 1995b].

- 13 Successive issues of *Economic Survey* of the government of India indicate a concern about the external debt situation arising out of the following: the declining level of the availability of external assistance because of

fresh commitments lagging behind the declining level of utilisation of credit.

- 14 As an aside it is interesting to note that this was not always the case. The early years of the 1970s saw the repeated reiteration of the goal of self reliance. In 1971-72 it was projected that a complete independence from net external financing by the end of the decade would be achieved. This was not mere nationalist rhetoric. Behind this assertion was some understanding of the political economy of international debt as aid was seen as yet another instrument of diplomacy which is liable to be deployed against us in the time of critical need. It is another matter that this recognition was not backed by a development strategy geared towards achieving this result as far from achieving complete independence India actually took recourse to an IMF loan in 1980. This loan came with a set of conditionalities that can be called mild in comparison with the SAP in operation now. However, climate for changed perceptions of development and growth was established and self reliance had no place in this new philosophy. With the 1991 IMF loan and the accompanying SAP the new direction of growth has come to stay.

- 15 As has been stated in the introduction this paper is not attempting to repeat the theoretical critique of the IMF-World Bank SAP that has been made in the context of other developing countries. However, it is still intriguing that a theory that appears to be logically consistent gives results that are contrary to the textbook prescriptions. In order to understand this paradox one needs to note that the logic behind the SAP is based on too many 'ifs' and on the premise that a correction in prices would induce the necessary resource substitution bringing about the desired improvement in macro indicators. Taylor 1988 and 1993 provide a succinct critique which can be summarised as follows.

The theory assumes that austerity would lower aggregate demand. If the output is determined from the supply side then lower demand would cause the price level to fall. Here again the assumption is that it is the price of non-traded goods that will fall. If the price of traded goods will be determined on the world market, if the law of one price applies. This implies that relative prices of tradables would rise. This would shift resources towards production of tradables, a process that devaluation would help and facilitate.

It is easy to see that the link can be, and indeed is broken at several steps and also that the assumptions of output being determined from the supply side as well as the law of one price are highly questionable in the context of the developing countries. Also primary product exports usually need more stimuli than just relative price shifts.

Maps of Experience

Narratives of Migration in an Indian Village

Radhika Chopra

So far studies on migrancy have either viewed the phenomenon as a response to economic pressures or as a negotiation between two cultures - of the migrant and the host. This ethnographic study questions the framing of the migrant in the earlier studies as an unitary category and instead provides plural experiences of migration wherein the position of the migrant remains ambiguously defined.

IN this article I explore the experiences of rural migration and contextualise and locate these experiences within the particularities of village life. The analysis draws on ethnographic fieldwork to provide an interpretive understanding of what it means to migrate. I also show that migration is an essentially plural experience and I attempt to capture this multiplicity through the narrative voices of the migrants themselves and then to open the category 'migrant' to pose the problem of muting experience within a unitary category.

I suggest that a hermeneutic frame is very constructive for exploring the plural nature of the experience through which the term 'migrant' is constituted and enables an understanding of the questions: what does it mean to migrate and who is a migrant? Drawing upon the hermeneutic paradigm with its accent on contextual meaning I will analyse in some detail the work and lives of migrant labourers in a Punjabi village¹ and ask who bears the marker 'migrant' given the diverse configurations of movement and pattern.

Most theories of migration try and spell out the mechanisms by which social, economic and political forces directly or indirectly affect the demand for labour and influence migration. These theories have generally concerned themselves with the problems posed in neo-classical economics which look at variables such as the nature, character and extent of migration and the utility/significance of costs and returns to the decision maker (constituted as a rational actor) in terms of long term or lifetime income. Another significant aspect is the view that migration is not so much a question of free rational choice but of survival given the essentially unfree nature of the labour market. However, in these theories it is the 'stream' of migration that becomes the focus of analysis [Goldscheider 1984, Sinha and Attallah 1987, Sidhu and Grewal 1984, Gupta 1988, Rao 1980, among others].

Another paradigm emphasises history and social structure and within that the negotiations between distinct cultures. Here culture as a way of life is a crucial construction and the argument is that by its very nature migration challenges the idea

of a unitary or single way of life [Bottomley 1992, Piore 1979]. The cultural group becomes the focus for analysing the play of power relations in the social field.

Within these broad frameworks two sets of issues are separated: one which concentrates on wages, work and the material conditions of migration; the other which looks at the social and political consequences of assimilation between different cultural forms. I suggest that we can bring these two concerns together and juxtapose the different materials or data which have otherwise been segregated: this enables a view of work as a process through which affinities are established. I argue that work as cultural practice itself enables the process of integration and different work patterns will implicate degrees of incorporation. It is imperative to analyse work rhythms if we want to understand processes of migration.

THE CONTEXT

Analyses of rural to rural migration in the north Indian state of Punjab [Gupta 1988] have argued that prosperity in any region acts as a magnet attracting workers from poorer hinterlands and regions. In the wake of the green revolution in Punjab labourers have migrated primarily from the eastern states of Bihar and the eastern districts of Uttar Pradesh and subsequently as the stream of migration swelled from the western and south western states of Rajasthan and Madhya Pradesh and even across the border from Nepal. Though migration into Punjab was always present to a modest degree, the real influx of migrant labourers began from the early seventies coinciding with the period of increasing agricultural productivity in the post green revolution period. In the eighties, despite the increasing mechanisation of agricultural operations, the introduction of new crops coupled with the intensity of the cropping pattern contributed jointly to a burgeoning demand for agricultural labour [Gupta 1988, Sidhu and Grewal 1984].

Punjabi agricultural labourers were unable to satisfy the growing demand and it was to machines and migrants that Punjabi landholders turned to complete agricultural operations within the tighter time frame imposed by the increasingly intensive crop

year. In agricultural operations such as wheat sowing or threshing or in separating maize from the cob, agricultural machinery bridged the gap between the demand and supply of labour. However, for the agricultural work surrounding rice cultivation (a crop which in one decade became one of the major cash earners in the village economy) efficient machinery was not readily available.

In the course of field work I was told that in the early stages, local Punjabi labourers were unaccustomed to rice cultivation, especially rice transplanting. By contrast, migrant labourers from the eastern regions had cultivated rice for most of their lives. It was to them that the work of rice cultivation was entrusted in the initial period. Over the decade Punjabi labourers became more accustomed to rice cultivation, but simultaneously the acreage under rice increased dramatically and migrant labourers continued to remain a crucial part of the village labour force arriving in great numbers at the peak harvesting seasons of wheat (April to June) and rice (September to November).

But merely outlining the fact that migration exists does not capture the variety of migration patterns into village economies precisely because there is no single pattern; neither does it begin to address the experience of migration from the point of view of migrants, or from the point of view of Punjabi villagers who interact with these 'strangers'.

While the material for this analysis was collected from the 'destination point' of the migrants, I did not feel the necessity of imposing my own geographical limits upon their narratives or to their sense of 'locatedness'. Many of the narratives that I collected, therefore, begin beyond the boundary of my anthropological location, in descriptions of different journeys, though the destination village was equally important for the description and analysis of the conditions of work and labour of the migrants, once they had arrived.

BACKGROUNDING AN EXPERIENCE

Govind Prasad Biswas of Village Dabra, Bihar, was married in May 1981. A lavish wedding was arranged with a large gathering invited for the feast which lasted three days.

Govind's father mortgaged their only plot of land for Rs 1,500 and was loaned another Rs 450 by his caste fellows.

A landholder loaned five quintals of rice for the feast; another gave Rs 500 which was to be returned after ten months with an added interest of Rs 250.

As agnates, Govind Prasad's father's elder brother and his son, Laxmi Prasad Biswas, were obliged to bear part of the wedding expenses. Five hundred rupees were borrowed in their name and they were responsible for returning the money. As head of the family, Laxmi Prasad's father gifted his nephew and his new bride Rs 600 borrowed from a moneylender with the agreement that Rs 900 would be returned after ten months. The entire transaction meant that their only plot of land was mortgaged so that the wedding and the gift giving could be conducted in the appropriate style. Despite the joyfulness of the occasion, the wedding created a circumstance in which the combined debt of the brothers was too large to repay from wage labour earnings or from their own meagre holdings, although the two sons shared the responsibility of repaying the debt.

In July 1981, Subhas Chander Biswas, a villager and caste fellow, returned to Dabra from Punjab. Subhas Chander's family had always been mildly derided by the villagers because his father came to live in his wife's household, flouting the norm of patrilocality.

Subhas, who bore the stigma of living off his mother's brother, started to rebuild their bamboo and thatch hut, converting it at considerable expense into a wood and brick structure. The feast to celebrate the new home was lavish. Naturally, people were curious at the new turn of events and Subhas explained that their new home was a result of his earnings from a village called Khanna in a district called Ludhiana of Punjab from where he had returned after harvesting wheat.

Subhas Chander's new found prosperity inspired extensive discussions within the village and twelve men made up their minds to replicate his journey. Among them were the cousins, Govind and Laxmi Prasad.

With their own private dreams of prosperity, the men from Dabra set off for Punjab in early April 1982. Though their travel expenses were small, they had to be raised through loans or by selling some assets. Govind Prasad sold a goat, Laxmi Prasad and another man borrowed from a shopkeeper in the nearest town. Another was helped by his father's brothers who pooled their resources to send 'their' man to prosperous Punjab.

It has been argued that labour is rendered mobile not to counter the shortage in the area of destination but to generate a surplus and create a fragmented labour market so that greater control can be exercised over local labour [Breman 1985, CSS 1990]. While this argument is important, it emphasises

on the factors inherent in the destination context rather than those arising from within the context of origin. Since the latter context was intrinsic to migrant narratives I have focused on the reasons for migration offered by the migrants themselves.

In the story told by the cousins, it was apparent that for many migrants the immediate incentive to leave their homes was provided from within their own communities. The visible differences in the living standards of returning migrants became an important reason for many of their co-villagers or kin to follow their example.

In addition was the factor of debt. Almost every migrant labourer interviewed in the Punjabi village (my geographical locale) had taken at least one loan and often more in his village of origin. The largest debts were for marriage or for building and reconstructing homes. A majority of the loans were not of long duration and had been incurred for less than two years in their village of origin. Hardly any of the loans were taken in the destination village of Mundh.

It is important to recognise that people make decisions and respond to changing relations of production not merely as a class of labourers or migrants but also as members of households and families and the transformation of a person into migrant, for the sake of the family, resonates through the narratives of migration.

TRACKING A JOURNEY

Laxmi and Govind Prasad left their families in Dabra as did the other ten men. Though Subhash had been encouraging in his assessment of Punjab, there was a sense of prevailing uncertainty: no-one knew how, where or when lucrative employment would come their way. Travelling with families was considered unwise for it would only compound the worry and the uncertainty.

There was also the firm conviction that they were not going to Punjab to set up homes. The whole venture was seen as a short-term visit for the season to earn and improve their own lives. As single men, they were quite confident of their capacity to rough it out, secure in the knowledge that their wives and children were being looked after in their homes.

The uncertainty was heightened by their mode of travel and the manner they found employment. The whole group travelled in a train crowded to capacity with people like them. There was so little space inside that the roof was packed with people heading out to Punjab.

Reaching one of the main junctions, the whole group made their way into the city of Jalandhar. With little or no idea of where to go, they arrived at the bus station where they spent their first night, making up their minds to stay together as far as possible for they knew no one else in this new place.

It was the next morning, when they were sitting a little uncertainly by the wayside, that a Sikh farmer, Joginder Singh, came upon them and asked them if they were looking for work. Receiving an affirmative response, he offered all of them jobs as agricultural labourers in his own village. With no other options, the twelve men from Dabra got onto the tractor and were brought to village Mundh.

In the village, all twelve were housed by Joginder Singh in the farm outbuildings that clustered around the irrigation well where some farm machinery and livestock were also housed. Joginder Singh did not have work for all twelve and persuaded five of them to go to the next village to work with one of his kinsmen and another to work with a neighbour, though he was permitted to stay with his co-villagers.

Since they had arrived a short while before the wheat harvest, there was little work for them to do. But the demand for labour peaked very quickly and Joginder Singh found it worthwhile to keep his labourers for a few extra days to begin harvesting promptly. He did not prevent them looking for work in the interval wherever they found it but they did so with the implicit understanding that they would first harvest Joginder's fields because they stayed on his land and were provided a few cooking utensils by him.

They all found some interim employment in the closing stages of the potato harvest, helping to load sacks of graded potatoes onto waiting trucks. However, this avenue of employment was limited because most of the trader-middlemen brought their own loaders. The six migrants worked on daily wages for five days as loaders and repaired irrigation channels for two, working for seven of the fifteen days before the wheat harvest.

At this stage, their work was quite specific and well defined. At the potato harvest, Punjabi women labourers sorted and graded potatoes while migrants weighed and loaded the sacks. When weeding and repairing irrigation channels, the amount of work to be completed was specifically stated and the hours of work well defined, a circumstance influenced by the presence of local labourer who worked alongside the migrants, acting as a natural check against overt imbalances.

To Laxmi and Govind Prasad, the daily wage of Rs 8 sounded more than adequate compared with the more familiar rate of Rs 3 in their own villages. A good part of the migrants' newly earned income was spent on provisions. Rice, their basic staple, was difficult to come by for the Punjabi diet was wheat-based. The village shopkeeper stocked some rice for the migrants but sold it to them for Rs 6 per kilogram. The local milkman sold 250 grams of milk for Rs 2, so most of their earnings at this point of time went spent on basics, leaving little to save.

WORK CONTRACTS AND WAGE AGREEMENTS

Migrants who received a daily wage were those who arrived well before the onset of the wheat or rice harvests. Daily wage agreements were made as a way of ensuring a steady supply of labour through the harvest and the itinerant work found by migrants in the interval was more to sustain themselves than to earn and save.

However, this was a period that local labourers worked alongside migrants at similar agricultural operations, ensuring some degree of parity in wages, hours and work by their very presence local labourers restricted the landowners' capacity to manipulate employer-employee relations.

The daily wage agreements changed at the harvests (for all labourers of the village). At the cereal harvests migrants received a piece-rate payment in cash calculated according to the number of acres harvested.

For the landowners' cash payments were considered worthwhile because the price of the crop was always higher than the amount of cash paid to the migrants. In 1982, for example, the average per acre yield of wheat was roughly sixteen quintals; the base price fixed by the state was Rs 142 per quintal. Migrants working in groups of five or six were paid Rs 120 per acre harvested. By contrast, local labourers earned a full quintal of wheat plus two portions of wheat stalk fodder. Such disparity was possible because now the local and migrant labourers worked separately and work agreements were autonomously negotiated.

The migrants also preferred money which they could send home. With kind payments they would need to find outlets to sell the grain in unknown markets amongst unknown people.

In April-May 1982, Laxmi Prasad and his co-villagers were paid Rs 120 rupees per acre of wheat harvested plus buttermilk and unleavened bread twice a day. They harvested eleven acres for Joginder Singh and another three for his cousin. They managed to harvest roughly two acres in three days which meant an earning of Rs 80 per day between six men or approximately Rs 13.50 per man, per day.

Unfortunately, the number of acres harvested were curtailed because Joginder Singh, like all other landholders of the village, had exchange relations with the local labourers and was obligated to let these families harvest part of the wheat crop and earn their food for the year. Inclement weather also interrupted the harvest at various points so the group from Dabra managed to work for 21 days. At the agreed rate they earned a total amount of Rs 1,680 from 14 acres, and each individual earned approximately Rs 280 in the month of May.

In June three agricultural operations were in full swing: the completion of the wheat harvest, wheat threshing and the beginning

of rice sowing. At the end of June, Laxmi Prasad sent home a money order of Rs 400, his cousin Govind sent Rs 350. They all decided to stay till rice transplanting was completed in mid-July. Transplanting payments were also calculated by the acre and paid to the migrants in cash. In June and July of 1982, Joginder Singh paid his migrant labourers Rs 115 per acre transplanted. They worked 18 days for him, transplanting 12 acres of paddy and transplanted another 11 acres for a landholder who paid them Rs 120 per acre. Each migrant earned Rs 450 for the single task of transplanting paddy.

From mid-April, when Laxmi Prasad left Dabra to the tenth of July when he and his group left to return, he saved Rs 750. He spent approximately Rs 350 on food, another Rs 100 on incidentals, Rs 160 on travelling to and from Dabra, a total expenditure of approximately Rs 610. His earnings for three months were Rs 1,360 or just over 450 per month. Govind who bought a second hand watch for Rs 60 and a sweater from a nearby town saved about Rs 650. Their earnings encouraged them enormously and they promised to return by October to harvest and thresh rice.

Between mid-July when rice is transplanted and late September when the rice harvest begins, there is little employment in villages for migrants. At this time they are willing to work for as low a rate as Rs 4 and two meals a day, not much higher than Bihar [GOI 1978]. Most of the migrants return to their own villages or seek employment outside the village economy: a significant percentage of the mobile, low-skilled urban work force in Punjabi towns is composed of migrants who shift between agricultural and urban employment. There are no figures available on the precise percentage of such migrants but in Jalandhar city (the nearest large town to the village) almost every cycle-rickshaw was pulled by a migrant and increasingly, most of the domestic help in urban Punjabi middle class homes is done by migrants.

The next influx of migrants was at the rice harvest: the overflowing trains coming into Punjab through October bore visual testimony to the laws of supply and demand for labour. Rice harvest agreements echoed the mode of payment at the earlier wheat harvest; in this village in 1982, the per acre rate varied between Rs 190 per acre with tea and bread three times a day to Rs 210 without any food.

TO EARN AND SAVE

Laxmi and Govind Prasad reached Mundh on October 12, 1982, after their visit to Dabra. This time they came in a group of ten, all of whom stayed at Joginder Singh's *khuh*; they had to urge Joginder Singh, who thought his crop was not fully ripe, to begin harvesting which he did almost a week

after they arrived. The ten men harvested and threshed through the night working 36 hours at a stretch. After five days and two nights they managed to complete seven acres. Until the morning of the 24th, when the rice was sent to the market, no payment rate had been negotiated with Joginder Singh; in fact it was fixed only the next day, six days after the migrants had begun work, at Rs 210 per acre. For seven acres this meant Rs 1,470 or Rs 147 per person for approximately a week's work. In about a month, Laxmi Prasad earned Rs 600 and within the first week of November had sent home Rs 400. In six and a half months (from mid-April to the end of October) Laxmi Prasad managed to save Rs 1,150 and had managed to clear almost the entire debt of 1,500 (inclusive of the mortgage) that his father had incurred at Govind's wedding.

Govind's father who had borrowed Rs 2,450 did not expect his son to bear all the expenses for his own wedding. According to Laxmi Prasad, his cousin's responsibility was less than his own, so that Govind's earlier contribution of Rs 650 and then another Rs 300 after the rice harvest was more than gratefully received.

Some aspects of the migrants' earnings in Punjab need to be highlighted. Though earnings were higher in comparison to their home states, there were only three major agricultural operations for which their labour was in demand—wheat harvesting, rice transplanting and rice harvesting-cum-threshing. Migrants engaged almost solely for these operations found their earnings dropped sharply in the interval between these three operations, making employment opportunities and earning capacities restricted and time bound.

The other point was the way in which the payments were fixed. Migrants could work for an employer without knowing specifically what they would receive beyond the broad parameters of prevailing rates within the village, as happened with the group from Dabra and Joginder Singh. Local labourers, by contrast, would refuse to begin work until their payments are fixed, and there was no way that an employer could go back on his word. On the other hand, employers needed to do no more than vaguely promise to pay migrants a particular amount, a promise which they were under no obligation to fulfil.

However, the room for negotiation, though limited, was not necessarily one-sided. Laxmi Prasad and his group could have moved to another person's fields if Joginder Singh had tarried beyond a point. In fact, it was that veiled possibility that induced him to be 'persuaded' by the migrants. However, as a consequence, even though he had hinted that he would pay the same rate received by local labourers, eventually he did not do so.

So far I have focused on migrants who stay and work only for short intervals in Punjab. But almost 45 per cent of the male migrants in the village had longer term contracts, the majority with monthly agreements and a small percentage by the year. The question of the multiplicity of the migrant experience depends a great deal on the terms of their contracts and most crucially, on the length of their stay in Punjabi villages. It is one dimension that allows the possibility of engaging with the question of who remains a migrant, and on what terms can different experiences be orchestrated under the overall category 'migrant'. It is also one area that allows a degree of exploration of the relations between migrants and local village folk. I will explore these questions through mapping two sets of experiences of those who chose or needed to stay.

Jita, an Oraon tribal of Basua village of Ranchi district in Bihar, eloped with Biri, a girl from his own tribe in 1980. Before his elopement, Jita had many quarrels with his family over his relations with Biri. Jita's family were landowners and wanted Jita to marry a girl from a family of equal status. Biri's own family were poor and landless, for her father had died in her infancy leaving his widow and the three children.

An Oraon from a neighbouring village who had returned from Punjab told his people about his visit and his earnings. The news filtered down to Jita who decided to elope with Biri to Punjab. Initially they worked in Phagwara tehsil of Jullundur district, before moving to the home of their employer's brother-in-law in Mundh. Jita was employed on a monthly wage of Rs 140 a month with three meals and tea twice a day. Biri was employed in the landholders' home for a monthly wage of Rs 30, food, clothing and bedding.

One of Jita's major tasks was to ensure the irrigation of the fields. Though the land was irrigated by tubewells powered by electricity, the supply was erratic, especially in the late summer months when rice was transplanted. Electricity would sometimes be resumed late at night or in the hottest part of the afternoon, and Jita's job was to turn on the pumps and patrol the channels to prevent breaches and then as each field was watered to divert water to the next. In the colder months of October and November when potatoes were sown, or in winter when wheat was sown, he had to irrigate the fields through the night in preparation for the next days, sowing often standing in freezing cold water to divert water or repair breaches.

His other major task was to feed and water his employer's cattle. He had to prepare their fodder twice a day, bathe and graze them and, after milking them, deliver the milk wherever necessary.

These were the two most specific tasks he performed. But he was called upon to do a number of other jobs as well. Some of his employer's land was hummocky and could not be ploughed by tractors. So Jita ploughed these fields with a bullock-driven plough after every harvest and before every sowing, levelling the land after the seed was sown. Under his employer's supervision, he fertilised the crop or sprayed pesticides whenever required.

During the major cereal harvests, he and Biri were expected to help with the harvest for no extra payment.

In contrast to migrants who are employed by the day or engaged for certain specified tasks, the work of migrants employed for longer durations is far more general and undefined. They may be on call at different times of the day or night depending on the agricultural operations being performed so that their hours of work are unregulated. Such an open ended work context is made possible because these migrants work on their own, not alongside local labourers whose presence may act as a check upon the employer.

WOMAN'S WORK

While there were only five women migrants in the village, the work they performed was stereotypical women's work and quite distinct from the work rhythms outlined above. Women migrants were among the lowest paid workers in the village economy and the only thing they had in common with some of their male counterparts was their longer durations of stay within the Punjabi village. All of them were part of a familial unit and did not work independently of their male kin. In all cases, the contracts and work agreements of their male family members were negotiated before their own.

Biri did an enormous amount of household work for her husband's employer, Paramjit Singh: washing the family's clothes and household linen, doing dishes, sweeping and cleaning the house and carrying food out to the men working in the fields.

In early 1981, Biri and Jita had a baby girl, named Munni, by Paramjit's wife, Joginder Kaur, who also looked after Biri during her pregnancy.

Unlike other migrant women who wore saris, Biri took to wearing the Punjabi dress of 'salwar-kameez', and could converse quite readily in Punjabi unlike her husband. More than Jita, Biri became an important member of the household and the community because of her close relationship with Paramjit's wife and daughter. They would often baby sit Munni or gossip with Biri, who confided her story to them.

Once, Joginder Kaur rebuked Biri for venturing outside the house without her veil (worn over the head by all Punjabi women),

for such an act was thought immodest and reflected upon the honour of the men, through their women. What was of significance was that Biri's behaviour was represented as a reflection upon the other members, because she was considered part of the household and no longer remained an 'outsider' or stranger whose behaviour would be of no consequence for the others. Even though Biri and Jita had a room out in the fields, Biri was counted as a member of Paramjit's household.

By the end of the first year Jita and Biri between them had earned Rs 2,040 and managed to save Rs 1,000. By the next year they deposited Rs 2,200 for a plot of land in Ranchi. In January 1983 they returned home the proud possessors of some land and their independence.

When Jita and Biri left to get formally married in Bihar, Biri was given the traditional Punjabi wedding gifts of bedding and clothing (gifts usually given by close kin) by Paramjit's family. After she left, Joginder Kaur and her daughter would often reminisce about Biri, not merely because a good worker had left but also because she was part of the family, who was not forgotten.

Migrants employed for longer periods can save substantial amounts though their savings take longer to accumulate. Though costs of living in Punjab are high in comparison to many of their home states [Krishna 1981], they set about saving with single minded determination aided by the fact that their ultimate destination is not Punjab but their own villages from which they came and to which they will return. For all her ties of familiarity with the Punjabi locale, Biri was always clear that she would eventually head back home; her decision may have been framed by Jita's resolve and his continued position as an 'outsider' which was far more marked than hers. Punjab for them was a temporary home, a refuge they sought and welcomed in the course of their personal histories.

TO HOME AND BACK

In the early stages of migration it was often Punjabi landowners who went to Bihar or whose relatives were settled in Uttar Pradesh, who persuaded people to come to Punjab as agricultural labourers. In the late 1960s, two landowners of Mundh visited Uttar Pradesh and prevailed upon three labourers to return with them. Subsequently these labourers went back only to return with more of their co-villagers. This scenario is in keeping with the view that migration is encouraged to fragment labour markets so that greater control can be exercised over local labourers [Bremar 1985, CSS 1990, Iyer and Singh 1980]. I draw attention to this question here only to point to the shift in my focus, a shift away from the intentions of the landholder-employers to the migrants.

and their 'view' or 'choice' as well as toward their engagement with processes within which they become located

Many of the migrants who came in the earlier period either with Punjabi employers or on their own had, by the eighties, become integral to the migration process. They had become labour recruiters for their Punjabi employers acting as links between their villages of origin and villages in Punjab.

Ram Julem left his village Sahajapur of Chhapra district in Bihar in the mid-1960s with a co-villager to seek work in Punjab. They first arrived in the town of Phagwara where Ram Julem's friend had earlier worked as a bricklayer. His ex-employer did not need labour at that moment but he had a brother, Shanker Singh, a landowner of Mundh who had just begun planting rice and needed a great deal of labour.

Ram Julem and his friend were the first migrant labourers in the village of Mundh. They were housed by Shanker Singh in the fields for no one was very sure how far to trust them. Their employer set them to transplant rice, agreeing to pay them Rs 70 per acre. Since they finished Shanker Singh's fields in half the allotted time Shanker loaned them to a cousin and from there to another kin member. Describing those early days Ram Julem spoke in accented yet fluent Punjabi of how they transplanted virtually all the paddy in the village that year for the local labourers were 'all thumbs'.

Other landholders made numerous overtures to the two Biharis hoping to lure them away. Never one to let grass grow under his feet, Ram Julem struck a deal promising to bring more Biharis with him for the next season if the landowners agreed to pay his fare to and from Sahajapur and ensure employment for all those whom he brought. The bargain approved, Ram Julem returned to his village in January 1966 and was back in Mundh by the middle of April accompanied by four of his village mates. By his own admission he recounted how he had charged a commission from each for ensuring employment for the forthcoming wheat harvest.

From then on Ram Julem became an important member of the village community. He would go back every year to bring labour for the clamouring landowners of Mundh, in his own village he became known as a *dalal* or labour middleman who for a price would provide employment for those in need of it. By 1975 he had earned enough to buy himself a piece of agricultural property in Sahajapur and the following year he bought another plot, both of which were managed by his nephew. His wedding in 1975 was partly financed by Shanker Singh, in recognition of his importance and 'worth' within Mundh.

By 1982 Ram Julem was as Punjabi as he was Bihari. He spoke the language fluently

and wandered wherever he wished. He knew everyone in the village, laid wagers with local labourers pitting his prowess against theirs or carried gossip about to the consternation and embarrassment of some and the glee of others. He was so well incorporated in the village community that the locals sometimes borrowed from him for he always had a ready supply of money.

His plump pocket was no secret to anyone. Every villager knew that Ram Julem's group of migrants always gave him a commission of Rs 100 for being 'escorted' to Punjab. Often some employers would pay over the migrants' wages to Ram Julem to distribute and he would keep a fraction for himself or he would arrange loans or advances for the migrants if they needed it and keep a commission for himself. He supervised the migrants' work, choosing the least onerous tasks for himself.

By 1982 he was no longer employed by the month but by the year. He was paid Rs 1,600 with meals and given a set of clothes and toiletries and he no longer lived out in the fields but was accorded the privilege of staying within the village *abadi* or nucleus, living in a small room in Shanker Singh's home.

In spite of being so well-entrenched within the village, Ram Julem did not bring his wife or baby son to live there; they lived in Sahajapur, looked after by his brother's family. Even though he lived for virtually the entire year in Mundh *ghar* - home - for him was Sahajapur and the appropriate place for his wife and property.

For migrants the recruiter was an important source of support for employment and credit, and a channel of communication *vis-à-vis* their employers. Though migrant labourers often put themselves in the hands of these recruiters in an effort to offset their own vulnerability, the recruiters themselves were in ambivalent and paradoxical positions. In relation with other migrants, the recruiter was clearly an 'insider', conveying the sense of inclusion through a series of signs that spanned language, residence and work. Some recruiters clearly exploited the migrants, structurally locating themselves with employers. In fact, in the everyday face-to-face contexts of daily life, they were the employers' face, allocating and supervising work, handing out the wages or loans and extracting commissions as 'interest'.

In relation to Punjabi village folk, recruiters were equally ambiguous. They were on the one hand clearly part of the village and its networks — Ram Julem lived within the village settlement, spoke the language and extended credit to local labourers, besides being treated as part of the family by Shanker Singh. But in terms of his kinship and property networks he faced outward, beyond the boundary of Mundh, within which he lived.

Not all recruiters were identical; some, like Subhas Chander who 'brought' the group from Dabra the first time around were almost as vulnerable as their group for their only 'surety' was a somewhat tenuous acquaintance with the employer and their only 'guarantee' an ever increasing demand for cheap migrant labour. Such recruiters were easily substitutable, after the first visit, it was Laxmi Prasad who brought a new set of men with him from Dabra.

VILLAGE AND MIGRANTS

Within Punjabi culture, relations of work are expressive of social exchanges and are constitutive of bonds of community. These bonds are reinforced through exchange in a variety of contexts so that, for example, a local labourer may be a ritual specialist as well as a debtor in his relations with a landholder-patron-creditor. Past and future are intrinsic to relations between village folk; indeed, people do not enter agreements with unknown others with whom they have no previous connections. These relations are amplified with the feeling of being part of a single village body (*pind* - village/corporeal body) of which everyone is a member.

Within the predominantly Sikh ideology that prevails within Punjabi culture - especially of rural Punjab - work of the hand, or service rendered personally by one's own labour has an intensely moral value. Sikh shrines of worship which are represented as the physical symbols of the gathered community of believers are built and maintained through *kar seva* or service of the hand. In this ideology labour work of the hand/body is therefore represented as the mixing of one's self or being with the performance of work.

Within the phenomenological world of everyday life migrants are an ambiguous category of persons. On the one hand they are strangers who look, dress and speak differently from Punjabi village folk. The attribute of 'stranger' gives meaning to their position and sense of 'location' within the village. They live beyond and outside the 'inner' space of the village community, the nucleated village settlement, out in the fields which are represented as the very symbol of outsideriness. For as strangers it is difficult to position them as part of the integral village 'body'.

On the other hand they are bound to village life through their labour which defines them as men of work, who, through the labour of their bodies mix their own humanness, their sense of self, with the work they perform. It is the labour of their body that binds them to the village community, the *pind* with which they become connected.

The negotiation between being 'stranger' and 'insider' is not entirely resolved. Unlike the complete stranger who is delinked from

any group and cannot cite any reference, the migrants are often introduced into the village through recruiters who are known, or even (as with Ram Julem) treated as kin, transforming them from being complete strangers to becoming 'invited strangers'.

The Punjabi term of reference for all migrants is 'bhaiyan' (plural 'bhaiyeh') literally translated as brother. It is a slightly modified version of the term for religious functionaries of Sikh shrines, itinerate salesmen and vendors – in short, all those who provide particular services to the village while not wholly part of it.

But unlike the religious functionaries and vendors who share a common culture with the Punjabi villagers the migrant bhaiyeh are culturally different folk. They speak a different language and Punjab is not their home; their orientation is toward the villages from which they originate and to which they will return.

From the migrants' point of view the negotiation is equally problematic. A majority of the migrants have no stake in the places into which they migrate; they need to keep up no appearances, follow no norms which incorporate them within the village. They do not need to observe the rules and limits which culture imposes. For example, they can disregard the proper pace or right way of working or eating.

Local labourers often joke about the amount of food the bhaiyeh consume. Tales circulate about the enormous size and quantity of bread eaten by each bhaiyan, the buckets of buttermilk they drink, and in comparison (as represented in these tales) the frugal meals of the local labourers. Their working rhythm is equally unrestrained and stories are whispered about their working through the night (as did the group from Dabra), a time associated in Punjabi folklore with witchcraft and ambiguity, when all proper men ('thereh huyeh handeh' – the steady folk) are aghed and asleep.

The tales certainly create exaggerated stereotypes, but they do not entirely shadow the migrant's view of the Punjabi village. In their relationship to their workplace, the migrants have no future. It is not the migrant who must store food to plan the year's consumption in the way local labourers or landholders might. The descriptions of the migrants eating without the least constraint ('behad' beyond limits, 'herok' unchecked) convey an understanding of the migrants' relationship to the village, because for them Punjab is a place from which they can, and must, extract as much as possible, whether of money or food, rather than save or store for they have no future stake here but are oriented to a world elsewhere.

Their 'stranger-ness' is also their vulnerability for it is precisely as strangers that their employers owe them no obligation and can exploit or manipulate them. The

lower wages they receive [Sidhu and Grewal 1984, Iyer and Singh 1980] finds root in this vulnerability underscoring their status as outsiders. Some studies and press reports which have noted the violence toward migrants [Singh 1983] find similar roots. It is only when and if some of them are able to transform their stranger status that relations of attachment (which can also be viewed as a requisite condition for security) become possible. Such a transformation is expressed spatially on the part of the Punjabis by allowing a movement from field/outside to the village settlement/core and linguistically by the migrants in everyday speech, as experienced by Ram Julem.

An equally important idiom for conveying the tenor of relations with migrants was the mode of payment. Local labourers received harvest payments in grain or food-crop (ann) symbolically expressing a sense of commensal attachment with a group through payments in food. Migrants received cash payments confirming their transitory relations as outsiders. Cash is the symbol par excellence of anonymous, impersonal transactions when the value of the good (the labour) is stated clearly in the price (the wage). Such calculation signals the end of a relationship where all accounts are cleared and there is no room for future expectations on either side.

There were few avenues through which migrants could reduce the negative implications of being strangers in an alien place. One of the more encouraging signs of a movement in this direction was the increase in the number of migrants who came without the aid of recruiters [like Ram Julem or as noted in other studies, CSS 1990:64] to whom they needed to pay a commission or who were often spokesmen of employers. Sixteen migrants in Mundh were accompanied by a recruiter, but he was either a village or kin member who acted more as a guide than a labour middleman. Two of the migrants brought small groups with them, but they themselves were recent migrants to Punjab. One of them had been in Mundh for less than nine months, while a second had been in another village altogether and had no contact with Mundh or its landholders. The reason this is encouraging is that migrants themselves perceive travel without aid or introduction as a possibility, a perception that has transformed at least for them the alienness of their destination into a place with some known outlines, made familiar through stories told by returning migrants.

Two factors have made it possible for migrants to travel without recruiters and without a specific destination. Over the years the continuous stream of migration has smoothened the obstacles which stood in the way of the early migrants. Now the trains

on which a majority of migrants usually arrive are known to potential employers who arrive at these nodal points to get migrant labour. While the violence to which migrants are subject upon arrival has been noted in some studies [Singh 1983, CSS 1990] another possibility has also emerged, none of the migrants in Mundh had been accosted in any violent fashion, and in their own narrations quite categorically stated that they had never been forced to work anywhere or accompany any employer against their will.

Increasingly migrants who arrive for the season travel in groups and try to get employment in the same or proximate villages so as to keep in touch and communicate vital information among themselves so that each individual feels a sense of support from familiar others. The cohesiveness of the group means easier social arrangements, but more importantly it means that they can negotiate their wages by acting as a small but effective bargaining group. The success of such strategy is evident – in the four villages visited by me during the period of fieldwork, the wage rates for migrants did not vary significantly and such consistency is a fact to be noted with some degree of optimism.

CONCLUSION

The diversity of the migration patterns and the plurality of the experiences of migration outline questions the telescoping of all difference under a single frame, as though by simply posing the category 'migrant' we are able to constitute all its expressions. I would suggest that comparing the cyclical patterns of seasonal migration with other more continuous or long term forms will give us a different understanding of questions which focus on the migrants' view of their destination and the entire process of migration. Quite crucially, it also enables us to address the issue of their vulnerability as subjects of violence.

In the narratives the destination village was constituted quite differently. For Laxmi Prasad and his group from Dabra, Mundh was a work place of great importance in their lives but their relations with it were almost entirely extractive. On the other hand, for Ram Julem, it was a place of work but one within which he had become enmeshed and therefore was to an extent a second home. He spoke the language, lived within the village settlement and had close interactions with numerous people. However, and quite significantly, he did not bring his wife and family to live there so that he made a clear separation between two kinds of home, one in which he lived and worked for most of the year and the other defined and constituted by the intimacy of family ties.

Unlike other migrants, Biri was only one among five women migrants within the village. Though she was involved with some

agricultural operations her major focus of work was the home of her husband's employer. It was Jita whose employment and work cycles followed the more conventional pattern of other migrants. But for Jita as well the presence of his wife transformed the village from a mere place of work and became for both a place of refuge. Undoubtedly their stay in the village was limited and their energies focused upon earning enough to return to their own state. But it was their earnings through their stay in Mundh that opened this possibility in their lives and they looked upon their refuge with hope, not misgiving.

Limiting the analysis to a small field – one village – three narratives – has enabled me to pose the question – who is a migrant – because all criteria of classification – duration of stay, repetition of visits, position within the village structure, presence of family members, relations with places of origin, etc. – can be cut up quite differently in each instance. This does not mean that we can only look at migrants as they differ from one another, but it does mean that we can look at how processes of migration combine the same elements in different ways, making it possible to experience migration in a distinctive style.

What is important to understand is that structure and style exist simultaneously and an analysis of the process of migration must move between the two. It is the processes of work that create the stylistic distinctions and enable us to view migration as structure and practice simultaneously.

The narratives reveal another dimension equally central to the analysis of migration – that the migrants are not the sole focus in constituting themselves. So the question of who is a migrant is not something that can be asked only of the migrants; it is also a category that comes into being by what others say of it or in the way others make it distinctive. So the view of the Punjabi village folk in constituting *bhaiyan* is crucial to the questions posed at the beginning of this article.

I suggest that while the repertoire of signals (to mark a person as migrant as opposed to other kinds of strangers) available to a Punjabi employer may be of one kind and make available to him/her certain avenues of conveying the message – through modes of payment or spatial locations, for example – the ways available to migrants are quite different – ways of working, or dividing home from work place form part of their repertoire. In posing the question we must therefore also be able to say from whose point of view and in whose symbolic language we frame the response.

If we agree that there is no one focus through which we address the category 'migrant' but a series of foci which shift depending on which set we look at – short

term, long term migrants, male, female migrants, male groups, family groups, and so on, or even a combination of some sets in the series, then it is important to recognise that there is no one way in which to convey the idea or meaning of migrant and that the person becomes marked as a migrant in a series of different ways.

Ultimately all the individuals discussed in this article could be cast as migrants but under different guises, but it is important to unravel the different strands if as sociologists we wish to understand and flesh out the experience of migration.

Notes

- 1 I draw upon fieldwork conducted in village Mundh of Jullundur district in the north Indian state of Punjab in 1982-83.
- 2 The combination of irrigation well, outhouses and sheds is generically termed *khuh*, a term of Persian origin referring literally to the Persian irrigation wheel. The general phrase for going out to the fields is *khuh nuh jana* for the *khuh* is constituted as the metaphor of the outside and opposed to the *abadi*, the village settlement that constitutes the inner core of spatial and metaphorical topography. The inside/outside opposition within Punjabi culture is extremely emotive so that being housed at the *khuh* would immediately signal the status of outsider or stranger, opposed to those who reside in the village *abadi*.
- 3 The cost of living in Punjab is considerably higher than the states from which a majority of the migrants come [Krishna 1981], implicating the migrants' ability to save, which is their main concern.
- 4 For most rural employers food was not counted as an expense whereas the lengths to which they went to curtail their cash expenditure was most striking. The difference arose from the attitudes toward food and cash. Cash, the symbol of potential future accumulation was jealously hoarded. The cost of any new purchase was the first thing to be determined by employers. People who constantly bought new things were both envied and derided as spendthrifts. Even the richest folk (especially the women) kept their money in the innermost pockets of their undergarments and expressed great irritation if money was asked for. Bargaining for bus tickets was quite common on state transport buses. On the other hand it was with the greatest sense of ease that loans of food for daily cooking were made; it was more than acceptable to take a cup of flour or cooked vegetable from neighbours and people passing by the door were always invited in to eat. Food symbolised inclusions within commensal units and was part of the creation of corporate communities [Chopra 1994].
- 5 In Bottomley's analysis of international migration she points out that migration creates international people who identify with kin, friends and other migrants virtually across the globe. Sociological studies of minorities often miss the significance of continuing interaction between homelands and destinations. (1992:4). On a smaller canvas, recruiters have similar Janus-faced quality so

that they move between seeing migrants and non-migrants.

- 6 'Going out to the fields' is a metaphorical way of conveying the idea of an outside place which is both threatening and potentially powerful.
- 7 Food is an evocative symbol in Punjabi culture. Sharing food has the capacity of transforming atomistic individuals into commensal groups, and grain or cereal crops, which are the base of bread, have a particular resonance in creating the sense of shared community. Conversely, exclusions are signaled through breaking off commensal relations or denying them [Chopra 1994].
- 8 The problem of holding back or veiling information always confronts fieldworkers and the possibility that I would not be told about violent incidents always existed. However, all the migrants knew I was not of Mundh and unlike the other village folk, who spoke to them only in Punjabi, I would converse with them in Hindi, establishing a bond through language. My stay in the village was also impermanent like theirs, a distinction which made us peculiarly alike, an aspect pointed out to me by Laxmi Prasad Biswas.
- 9 Bourdieu's perceptive discussion of the habitus is very useful to frame an understanding of such a movement between structure and practice (1977).

Global Population Growth, Economic Development and Environmental Impact

Case Study of India, 1991-2100

Mahinder Chaudhry

The nature of environmental problems depends upon the level of economic development, the nature of industrialisation, the degree of urbanisation and the effectiveness of public policies. This article examines the impact of population growth and economic development separately but with reference to the conjectured global warming between 1991 and 2100, with special reference to India.

I Introduction

BOTH developed and developing economies face the challenge of sustained economic development without environmental damage. Although sustained economic growth is a necessary condition for eradication of poverty and wide-spread increase in human welfare, it is by no means a sufficient condition. Economic progress has, in general, potential adverse environmental effects. The evidence of it is not lacking in the industrialised as well as in the less developed countries. The environmental damage that is global in nature and irreversible over a very long time underscores the truly international nature of the problem. Since the external diseconomies associated with environmental damage are not a part of the private (firms and households) costs, the role for the national public policy becomes imperative. Also the environmental impacts which are global in nature necessitate policies at the international level. The formulation of economic development strategies with full consideration for environmental concerns must be based on accurate and clearer understanding of the problems involved.

The nature of environmental problems depends upon the level of economic development (gross national product per capita), the nature of industrialisation, the degree of urbanisation, and the effectiveness of public policies. In general, the developing countries experience immediate environmental problems related to scarcity and safety of drinking water, inadequate sanitation facilities, air pollution in urban areas, soil depletion and degradation, indoor smoke from burning biomass (wood, coal and dung), and outdoor smoke from burning coal for industrial production. In addition to the direct negative effects on human and animal health, the economic productivity is significantly reduced. In contrast, the industrialised societies encounter a different set of problems such as carbon dioxide emissions (CO₂), petrochemical smog, depletion of stratospheric ozone, acid rain, and hazardous wastes. Ever

expanding industrial production, agriculture and transportation systems are endangering the sustainability of the healthy globe.

This paper examines the impact of population growth and economic development separately but with reference to the conjectured global warming between 1991 and 2100. The exercise is primarily based on the CO₂ emissions which account for

nearly two thirds of global warming. The contribution of deforestation to total carbon emission is projected to decline from 12 per cent in 1985 to less than 3 per cent in 2100. Following the World Bank classification scheme of low, middle and high income countries, the total world increases in CO₂ emissions over the next century are assessed within these groups of countries. India is

treated as a separate group by itself. The basic data estimated by the US Environmental Protection Agency (EPA) (1990) and by the Intergovernmental Panel on Climate Change (IPCC) (1991) are employed for analytical purposes.

Section II outlines the scientific framework of the climate change and projected global warming. As an illustration of the economic costs involved from the projected global warming, the findings about the US economy as estimated by Cline (1992) are highlighted. Section III discusses the decomposition process and presents the findings. The period under study is divided into two sub-periods: between 1991 and 2025 and between 2025 and 2100. Section IV examines

environmental scenarios for India for a medium term period of 35 years (1991-2025) with respect to safe water supply, sanitation facilities, urban concentration of particulate matter, and urban concentration of urban sulphur dioxide. The concluding remarks follow in the next section.

II

Economics of Global Warming

The global warming or the greenhouse effect is the process of heat trapping due to rising atmospheric concentrations of CO_2 and other gases emitted from deforestation, the burning of fossil fuels, and other human activity. These CO_2 gases are transparent to

incoming shortwave solar radiation but opaque to outgoing long-wave (infra-red) radiation from earth. The scientists estimate that the natural levels of these gases raise the earth's average temperature by some 33°C , from -18°C to $+15^\circ\text{C}$. The General Circulation Models (GMCS) prepared by the international expert climatologists estimate that "a doubling of carbon dioxide-equivalent above preindustrial concentrations would increase global mean temperatures by a best-guess estimate of 2.5°C , with typical bounds of 1.5°C and 4.5°C [Cline 1992]. It is further projected that this doubling of carbon dioxide-equivalent is expected to arrive as soon as year 2025 under the assumption business as usual. Further if allowance is made for ocean thermal lag, the doubling year perhaps would be around 2050.

The IPCC estimates that the greenhouse effect will cause significant global warming by the middle of next century in the absence of any policy intervention. It may be noted that while most European countries, Japan, and Canada have set targets for reducing emissions of carbon dioxide, the policy-makers in the US have yet to do so. According to the IPCC calculations, under the business as usual scenario, the average global warming would reach 5.7°C by the year 2100. Since this process of global warming does not stop at the conventional benchmark of a doubling of CO_2 concentration, Cline (1992) estimates that global emissions could increase from 6 billion tons of carbon or 6 GtC (GtC = gigatons of carbon) today to 20 GtC by the year 2100 and over 50 GtC by late in the 23rd century. Then the atmospheric concentrations of carbon could multiply eight-fold and global temperatures would ultimately rise by a central estimate of 10°C and by 18°C for the upper bound. In brief, this is the scientific framework for the projected climate change.

As an illustration of possible economic damage from the carbon dioxide-equivalent doubling in the atmosphere (benchmark 2.5°C), some of the costs to the US economy as estimated by Cline (1992) are as follows. These estimates are calibrated in absolute dollars and are expressed as percentages of the 1990 gross domestic product (GDP) of six trillion dollars (6×10^{12}). (a) The overall economic damage suffered by the US would be of the order of \$60 billion, or 1 per cent of GDP. (b) The agricultural losses from heat stress and drought are placed at \$18 billion. (c) The sea level rise due to thermal expansion of sea water and melting of glacial ice will cost \$7 billion. (d) The increased costs of air-conditioning (increased use of electricity) would amount to \$11 billion, in contrast, the off-set for reduced heating costs would be only about \$1 billion. (e) The costs of reduced water supply amount to \$7 billion due to lesser run-off in the water basins. (f) The increased urban

(b) India gross national product US \$ 350 in 1990

Source Adapted from World Bank data (1992)

pollution (tropospheric ozone) associated with warmer weather would impose an annual cost of \$4 billion (g) An increased incidence of mortality with heat stress would amount to \$6 billion when annual life losses are conservatively valued at life-time earnings (h) The lumber value of forest loss would be over \$3 billion annually (i) The ski-industry losses due to shortened ski-seasons and relatively smaller quantities of snow would amount to \$1.5 billion annually (j) In addition there would be other tangible costs on account of increased hurricane and forest fire damage (k) If other intangible losses, particularly species loss and human disamenity, are included in the total damage, the costs as proportion of national GDP could be as high as 2 per cent (l) With upper bound warming of 4.5°C from doubling of carbon dioxide equivalent the corresponding range of damage could be 2 to 4 per cent of GDP

The above quantitative case study demonstrates substantial damage costs in the medium long-term and very long-term future. The costs of delays in policy formulation and implementation are indeed high in economic terms. The intellectual demands for a proper policy formulation are equally challenging.

III Decomposition of Carbon Dioxide Emissions

If the carbon dioxide emissions (CO_2) concentrations (or an equivalent combination of several greenhouse gases) are doubled from the pre-industrial level, the equilibrium temperature of the globe is predicted to increase from 1.9°C to 5.2°C. The climate sensitivity is conservatively assumed to be 2.5°C and the globe will be warmer by 4°C

by 2100. The US Environmental Protection Agency estimated a mean rise of 0.6°C above the pre-industrial level and predicted a temperature rise of 1.5°C by 2025 and of 4.4°C by 2100. The IPCC estimated a mean rise of 0.9°C in 1985 and predicted a temperature increase of 1.9°C by 2025 and

of 4.2°C by 2100. However, the actual warming by 2100 could be as high as 9°C in case the 'climate sensitivity' turns out to be 5.2°C instead of the generally assumed 2.5°C, or as low as 3.2°C at the lower end of the range.

The determinants of annual CO_2 emissions could be divided into two groups: population growth and economic growth. The latter group may be further subdivided into energy intensity of gross national product, carbon intensity of energy consumption, and tropical deforestation. The data estimated by the US EPA and IPCC form the basis of the decomposition into two broad determinants. It is assumed that the population growth is not an endogenous variable in the model and further it is assumed that there is no interaction term between these two determinants that is, the two determinants are independent [Bongaarts 1992]. For analytical purposes, the period under study between 1991 and 2100 is divided into two sub-periods of 1991-2025 and 2025-2100. Following the World Bank classification scheme, countries are grouped as low-income (GNP/capita in 1991 of US\$ 635 or less), middle income countries (GNP/capita in 1991 of more than US\$ 635 but less than US\$ 7,911) and high income

countries (GNP/capita in 1991 of US \$ 7 911 or more). Although India is included in the low income group, it is treated as a separate group by itself (GNP/capita in 1991 of US \$ 330).

The low income economies (40 countries with a weighted average per capita income of US \$ 350 in 1991) account for 58 per cent of global population. By the year 2100 the global population share is projected to be 65 per cent (Table 1). Over the 35 years period 1991-2025, the population growth alone will contribute 54 per cent of the CO₂ emissions and during the following 75 years, 2025-2100, their contribution will decline by 13 per cent (Table 4). The total emissions are shared almost equally by the two determinants.

In contrast the high income group includes 22 countries with a weighted average per capita GNP of US \$ 21,050, accounting for only 15 per cent of the total population in 1991. During the first sub-period, the population growth will contribute one-third and economic development the remaining two-thirds. However, during the second sub-period (2025-2100) the economic growth will contribute almost the entire increase in the emission, only a 6 per cent share is attributed to population growth (Table 4).

India's projected population growth is very sizeable indeed, almost doubling from the present level of 866 million in 1991 to 1,635 million by 2100 (Table 1). According to the very long-term projections, India's population will stabilise at 1,862 million

sometime in the middle of the 22nd century (Chart 7). During the first sub-period, India's population growth will contribute 50-39 per cent share of the total emissions, but during the second sub-period the share attributed to population growth declines by about 40 per cent. In other words, the proportion attributed to economic growth increases by 43 per cent during the second sub-period (Table 4).

The estimates of CO₂ emissions by the US EPA are based on the assumption of annual growth in per capita income at the rate of 3 per cent for the developing countries and 2 per cent for the developed countries between 1985 and 2100. The global average GDP per capita is projected to rise from US \$ 3,000 to \$ 36,000 between 1985 and 2100 in terms of 1985 dollars. These assumed rates are derived from the actual growth over the past two decades. No doubt this assumption remains very crucial in this exercise. India's average annual rate of growth rate of GDP during 1970-80 was 3.4 per cent and during 1980-91 was 5.4 per cent (World Bank 1993). If the economic growth trends of the 1980s continue and further improve in the future, our assumed rate of 3 per cent growth in real income over a long period may turn out to be on the low side.

The energy intensity is projected to decline rapidly. For the developed economies (in megajoules per dollar GDP) it declines from 20 in 1990 to 4, and for the developing countries from 25 in 1990 to 4. However, the pace of decline for the developing countries is very slow. The carbon intensity is measured as grams of carbon per megajoule. At present, the average carbon intensity in developing countries is higher than that of the developed economies. This is so because the developing countries derive a sizeable part of their energy from coal and use less energy from non-fossil fuels.

Deforestation produces about 0.7 petagrams of carbon per year. This annual rate of emissions is to rise slowly to 1.1 petagrams in 2075 and subsequently decline to 0.8 petagrams in 2100. As noted earlier, the proportion of total global emissions attributed to deforestation in 2100 is only 3 per cent by the US EPA estimates. The estimated values of different factors used in these calculations are the product of a very detailed assessment and complex computer models.

IV

Environmental Scenarios in India

A recent World Bank study (1992) has traced an 'average' relationship between the level of economic development (GNP per capita) and the corresponding environmental damage/stress. India's current position is identified on each of these average patterns of economic development-environmental relationships for the current year (1991), and

CHART 6 CARBON DIOXIDE EMISSIONS FROM FOSSIL FUELS PER CAPITA AND COUNTRY INCOME LEVELS
GLOBAL AND INDIA

- 1 India GNP US \$ 350 (Log = 2.544 in 1990),
2 India GNP US \$ 985 (Log = 2.993 in 2025).

CHART 7 LONG TERM GLOBAL AND POPULATION PROJECTIONS UNDER DIFFERENT
FERTILITY TRENDS 1985-2160

- Notes (a) Base Case Countries with high and non declining fertility levels begin the transition toward lower fertility by the year 2005 and undergo a substantial decline by more than half in many cases over the next 40 years. All countries reach replacement fertility levels by 2060.
(b) Rapid Decline Countries not yet in transition towards lower fertility begin the transition immediately for countries already in transition total fertility declines at twice the rate for the base case.
(c) Slow Decline Transition towards lower fertility (triggered when life expectancy reaches 53 years) begins after 2020 in most low income countries. For countries in transition declines are half the rate for the base case.
(d) India Assumed year of reaching net reproductive rate of one (total fertility rate of approximately 2.2) by year 2015. The projected stationary population is 1.862 million around 2150-2160.

Source Adapted from World Bank data (1992)

the likely change over the next 35 years (1991-2025) is measured. India's per capita GNP is projected to increase to US \$ 985 in terms of 1990 US dollars at the average

annual rate of 3 per cent. For calculating the change over time the log values of GNP per capita are used. The following general observations can be made: (a) The proportion

of population without safe water supply will decline from 75 per cent to 42 per cent between 1990 and 2025. Four out of every 10 households will be without safe water supply (Chart 1). (b) Similarly one out of every four households will be without adequate sanitation by 2025 (Chart 2). (c) The level of urban concentrations of particulate matter will drop by about 50 per cent from 1,600 to 800 micrograms per cubic metre of air (Chart 3). (d) The urban concentrations of sulphur dioxide will increase by about 70 per cent over the same 35 year period in terms of micrograms per cubic metre of air (Chart 4). (e) Municipal waste per capita is projected to double amounting to 200 kg in the year 2025 from the present level of about 100 kg (Chart 5).

V

Concluding Remarks

The future is uncertain especially in economic and social developments. These long term projections over the next century must be interpreted as no more than broad trends. As a member of the profession of economic demographers I must inject much needed modesty in claiming the degree of accuracy reflected in mathematical manipulations and assumed relationships. Nevertheless it is clear that any rapid decline in the population projection for India over the next two decades will result in a considerable environmental improvement in the long run. The best environmental policy will remain a rapid decline in population growth in the country in general and Uttar Pradesh in particular.

[The paper was presented at the XVII Conference of the Indian Association for the Study of Population to be held at the University of Annamalai Annamalai Nagar Tamil Nadu December 16-19 1993 in Session C: Population Growth and Sustainable Development organised by M K Priem for the *Volume of Contributions* for the United Nations World Population Conference September 1994.]

Burden and Burden-bearers of Marx

Sharad Patil

ARUN PATNAIK has pinpointed and theorised the three controversial points in K Balagopal's article (*LPW* January 7) in his rejoinder in *LPW* May 20. The basic position on which he builds his polemic is as follows.

The people's movements are not simply too numerous but terribly sectarian, disjointed and unrelated to each other. An agrarian struggle throws at the birth of dalit movement and treats any critique of caste as a divisive force in the course of class struggle. A dalit movement dismisses feminism as an urban middle class women's problem as if the latter do not have material interests in women's questions. It does not even hesitate to show now and then obvious contempt for an activist group's nationality aspirations. A women's movement raises the critique of patriarchy as if it does not have anything to do with the struggles of ryots and coolies.

A scientific scrutiny of one's own ideologies is substituted by a superstitious commitment to it. A recognition of one's own limitations which can lead to the appreciation of the others' strength and thereby to unity is substituted by a斤斤计较 discourse.

ONE'S LIMITATION VS. OTHER'S STRENGTH

Scientific scrutiny is expected by Patnaik. I think also from Marxists, or rather the communist parties. I would delete also and substitute mainly the reason being that they possess relatively the most advanced revolutionary science. He has defined scientific scrutiny as 'recognition of one's own limitations which can lead to the appreciation of the others' strength. What are the limitations of Marxism and the strength of Ambedkarism and feminism? He has not spelt them out in clear terms as he has done in case of Balagopal and the ecologists. He himself does not seem to be prepared to admit the strength of others' arguments. Balagopal's argument on ecology is clear and simple enough.

According to him [Balagopal] ecologists rightly argue that there are natural limits to the human praxis, evolution of which brings disasters for the human beings. Human potential is better realised and expanded by recognising nature's limit and humankind's praxis. Marx's cone of growth of productive forces i.e. the growing transformation of nature and human potential assumes (sometimes) that human praxis is unbounded and its limits/possibilities/ ecological sphere disproved such an assumption.

There is no harm in accepting this simple fact. But only because Balagopal connects

this fact with Marx's incorrect assumption. Patnaik tries to drag him into the intricacies of the dialectical relationships between nature and nurture, man and labour. Dialectics is usually confused with 'dialectic argument'. Dialectics is the cognition of the laws of movement, motion of objective reality while in dialectical argument reasoning is often a resort to sophism. Mao recognised correctly the objective relationship between antagonistic and non-antagonistic contradictions on the basis of his study of these contradictions in the Chinese revolutionary movement. These contradictions do not exist in watertight compartments; rather they transform themselves into each other. Lenin could not recognise this relationship in objective revolutionary reality and hence concluded hypothetically that these two types of contradiction exist in watertight compartments i.e. they do not get transformed into each other. That class contradiction is the only antagonistic and hence the only revolutionary contradiction in society and that it will cease to exist in socialism. Basavrajputra used Lenin's subjective cognition of the law of contradiction to attack Mao's objective cognition of that law of dialectics in the very centenary year of Marx's death anniversary (1983). Mao was vindicated by the fall of socialism in Europe at the end of that very decade.

What is the strength of feminism? Its contention that Marx overlooked the fact of the share of the worker's wife in the creation of surplus value. To accept this simple fact is not sufficient here. Her overemphasis of patriarchy in the subconscious of Marx played a role here. Acceptance of the simple fact should be accompanied by the acceptance of the theoretical cause underlying the fact. The denial of gynocracy by Engels and the feminists confuses. The feminists' denial is subjective. For their historical materialism is based on the dogma that women as a class were never exploiters and oppressors. As for Morgan and Engels their factual knowledge of the primitive society did not go beyond the American tribes based on mother right and also because they accepted Bichofen's thesis that gynocracy was an exception while matriarchy (mothers' rule) was a rule of the development of the primitive society. It should be noted that Morgan and Engels equated mother right with mother rule or matriarchy and matriarchy with primitive communism. They rejected gynocracy (rule of women) also because it could not be equated with primitive communism. British based *The Manchester* assumption that human society

started everywhere with matriarchy/gynocracy. These were the two dogmas that were sought to be countered by the feminists with their dogma of archetypal patriarchy. Primitive communism has been disproved by anthropology while gynocracy was proved by Gurdon's book *The Khasis* (1914) which is based on factual account. The Khasi and Garo women are now fighting for retention of matrilineality (*Indian Express*, May 21-22). Leela Duhe's paper 'Conflict and Compromise: Development and Disposal of Property in a Matrilineal Muslim Society on the Lakshadweep Muslim Malis published in *LPW* (May 21) is a reminder of Kerala's gynocratic past which has been documented by Padmanabh Menon in his *History of Kerala*. But none the less, it should be noted that human society has not passed through gynocracy as a rule everywhere in the world.

With Ambedkarism it is a totally different matter. Ambedkar's contention is that Indian society is basically a caste society though he does not deny the existence of the class system in it. His contention has still not been accepted by the traditional communist parties though they have been compelled to give their assent to reservation to the OBCs after the partial implementation of the Mandal report by the V.P. Singh government. But the left front led West Bengal government's opposition to the Mandal report continues. The Constitution had already granted reservation to the 22.5 per cent SCs and STs. With the present central government's declaration of granting reservation to 52 per cent OBCs the victims of the caste system add up to 74.5 per cent of the Indian population. The Mandal report has proved that it was the all-pervasive tyranny of the caste system which kept the lower castes socially backward and economically poor. The poverty of these castes stemmed from their social discrimination and they did not become socially backward because of their poverty (p. 40). This is the strength of Ambedkarism.

RESERVATIONS OF CASTE

But as the rigid posture of the left front of West Bengal shows that the traditional communist parties are still averse to accepting this simple but unique fact of the Indian social system. The theoretical basis of their opposition to reservation was given out by S.G. Sardesai in his booklet *Class Struggle and Caste Conflict in Rural Areas* published on the heels of the Marathwada riots (1979) in which he affirms that in principle reservation is 'basically undemocratic' (p. 33). For traditional Indian communist parties models of everything - philosophy, methodology (historical materialism), history, politics, economics, revolution, democracy, aesthetics, etc. -

existed in Europe (for naxalites in China). Did the model of ancient Indian tribal democracies exist in Europe?

Traditional Indian communist parties and Marxist scholars are afraid that if the strength of Ambedkarism is admitted it will open a Pandora's box resulting in the 'total' inapplicability of Marxism to Indian conditions. But the Pandora's box has been opened up by no human agent but by history itself. When the third world countries came on the centre stage after the second world war, their non-class social systems intensified the contradiction in the Marxist methodology, the contradiction between its class form and its content applicable to all social systems. But of all other social systems, it is the caste system of India that confronted Marxist methodology and philosophy with pertinent questions, which may be briefly listed as follows:

- 1 What is the definition of class in relation to caste (varna and jati)?
- 2 Is jati material or superstructural?
- 3 Was there class in pre-British Indian society?
- 4 If class did not exist in pre-British Indian society, what is the historical materialism of varna and jati?
- 5 In such a situation should Marxist methodology be unilinear or multilinear?
- 6 Will then the 'recorded history' of India be a history of class struggles or caste struggles?
- 7 Is then the caste contradiction antagonistic and revolutionary as averred by Ambedkar? Will the Indian democratic revolution be traditional or unique in its task of caste annihilation?
- 8 Was the Indian renaissance and enlightenment elite?
- 9 Did the class aesthetics of socialist realism prove to be inapplicable to Indian literature, arts and culture because of its epistemology of reflectionism?
- 10 Did Indian aesthetics and poetics develop only in the unilinear brahmanical current, or was it confronted by non-brahmanical aesthetics forged by the Dignaga school of sautrantika vijñānavāda (critical realism in the words of Satkari Mukherjee)?
- 11 If the epistemology of the brahmanical poetics was pratibimba-vāda (reflectionism), what was the epistemology of the non-brahmanical aesthetics?
- 12 Can that non-brahmanical epistemology offer a higher and more profound epistemology than reflectionism as hinted by Toynbee and Ikeda in their 'Chousei Life'? My forthcoming vol II, entitled *Caste, Feudal Servitude*, provides answers to these questions.

SACROSANCT CONNECTION AND AUTONOMY

I am now tempted to take up Balagopal's argument 1, dealt philosophically by Patnaik. The argument and its philosophical treatment is as follows:

'Balagopal asserts that Marxism underestimates the character of the psychic

process because it treats consciousness as a derivative of material process. But, in actuality, psychological attributes like hatred, selfishness, violence on the one hand and loving, caring, fellow-feeling on the other constitute the moral (psychic) sphere which is autonomous of the material (physical) process. Balagopal does not deny that the material physical sphere also constitutes the human existence. But he denies that it has any causal connection with the spiritual reality. Yet, he argues, they are two parts of a single process which he does not bother to define or elaborate *à la* Marx. Thus, he argues, "Marx certainly did not ignore the moral history of humankind, but for him this moral history has no parameters of its own but is a derivative of the material history... The human species possesses moral as well as physical possibilities - based on psychic and physical structures both of which it has elaborated conjointly in the course of its struggle to satisfy its constantly elaborated needs..."

'If they are autonomous of each other, how are they united (connected)...

'He accepts *à la* Marx that social being determines social consciousness but denies whether being determines consciousness...'.

Balagopal does not argue that matter and mind are independent or unconnected. What he is driving at is that mind is autonomous. Discontent in philosophy is voiced by comparative laymen (academicians having lost the sense and feel of the 'new') in confused and inconsistent terms. What is to be noted in such a crisis-ridden condition is that the concerned philosophy is no more fulfilling the growing new need of explaining the qualitatively new stage in the ever developing objective reality. The confused and inconsistent expression of the discontent has to be translated in clear and consistent terms.

Mind, on the one hand, as cerebral cortex, is an inseparable part, not even derivative, of the physical body. But, even in that relation its functions differ from the other organs of the body - it governs them, and to that extent it is autonomous. Apart from this 'physical' function, it has the unique function of thinking of consciousness, the 'highest bloom of matter' as Engels called it, with which the autonomy increases. But for Marx, Engels and Lenin this consciousness is nothing beyond the reflection (it may be of various kinds) of objective reality. Debī Prasad Chattopadhyaya has shown in *Lenin the Philosopher* that Marx did not create his own epistemology, but took it over ready-made from mechanical materialism. Though he extricated himself from Feuerbach's mechanical materialism, he shackled himself anew by adopting the reflectionist epistemology of mechanical materialism. If consciousness - to be precise, the thought process - only reflects the objective reality, it can create nothing new. This leads to the epistemology of the Sankhya, according to which everything is immanent

in Prakṛti, which in its development manifests in actuality only what is stored in her in an unmanifested form. That is why its causality is called 'sat-karya-vada' (Karyam sat, effect exists in the cause). No qualitative changes occur, only quantitative changes take place. Abhinavagupta (10th century AD), the greatest brahmanical aesthetic, based his 'abhava-vada' on this sat-karya-vada. But, chemistry proves qualitative change, the birth of the new, a break between the old and the new. It does not bother about the sundering of the 'causal connection'. Objective reality develops in discontinuous continuity. Marx's dialectics admits qualitative change, birth of the new, a break between the old and the new. But his borrowed reflectionist epistemology tries to muzzle consciousness; the highest bloom of matter was thus subjectively prevented from blossoming infinitely. That is why Marxist philosophy could accomplish the physical socialist revolution, but could not create its new man.

Buddha, Christ and Muhammad were, according to Marx and Engels, social revolutionaries. They revolted against their respective social beings and ushered feudal revolutions. In this respect they were not derivatives of their respective social beings. Their social beings, as far as the social revolutions they accomplished are concerned, were similar. But they created different kinds of moralities. The last two were social revolutionaries, prophets, but Buddha was over and above that a philosopher, who, according to S N Dasgupta, created a new philosophy which registered a break with all the prevailing philosophies. Herein lies the autonomy of consciousness.

Is the child a 'pale imitation' of its parents? According to genetics, the synthesised new is born in the womb itself and the embryo is also a break with its progenitors. The consciousness of the offspring develops and works with increasing autonomy from the consciousnesses of its mother and father, and may turn into their total opposite for better or for worst, sacrificing the sacrosanct 'connection'.

Ikeda says that 'all Western philosophies are built on a study of consciousness' (Marxism included). Toynbee develops the point by saying that 'the subconscious is the source of intuitions that can inspire rational thought but that cannot be reached by the mind so long as the mind is confining its activity to the conscious level'. So beneath the autonomous consciousness itself there lies the super-autonomous subconscious.

I will conclude this brief intervention with an apt tale told by Buddha to his disciples. A traveller encounters a river full up to both the banks. He makes a raft and with its help swims to the other side of the river. Buddha then asks his disciples as to whether the traveller, obliged to the raft, should continue his journey bearing the raft on his head, or leave the raft and resume his journey?

National Accounts Statistics of India - 4

Value Added to Output Relationship by Economic Activity

LPW Research Foundation

The focus of this fourth set of NAS series is on the interrelationships between output inputs and value added by major industry groups. These interrelationships have considerable analytical significance and the CSO constructs the input output structures of all sectors of the economy for deriving GDP or gross value added (GVA) that is gross output *minus* input (intermediate consumption). Apart from the fact that these are necessary aspects of the preparation of national income and related aggregates, the CSO has been putting out based on these data regular input output transactions tables, the latest one being for 1983-84 (CSO 1990). However, the NAS provides for public consumption the detailed input structure for a few economic activities, and for few others only data on gross output and value added are published. Accordingly, the accompanying tables present the input structure for agriculture and livestock and value added to output relationships for a few categories of major and minor minerals and for all two digit level industrial categories under registered manufacturing.

I

Methodology and Data Sources

Agriculture and Allied Activities

This sector comprises agriculture proper, livestock and livestock products and operation of irrigation systems. Agriculture and livestock activities go together and it is not always feasible to segregate the inputs like livestock feed, repairs and maintenance costs, consumption of fixed capital (CFC) etc. into those used in agriculture and livestock production.

The principal sources of information used for purposes of building up the estimates of GVA from agriculture provided by DESAg are (i) Land Use Statistics (LUS) which mainly classifies land according to its various uses, (ii) Area and Output of Principal Crops, provides periodic estimates of area and output of the principal crops generally known as food crops and (iii) Cost of Cultivation Studies (CCS) which involves collection of representative data on inputs and outputs in physical and monetary terms and thus estimating the cost of cultivation as well as production

The principal sources of information for data on various aspects of livestock production are (i) Integrated Sample Survey (ISS) that conducts sample surveys for the estimation of livestock products and (ii) Indian Livestock Census (ILC) conducted quinquennially that provides age wise and sex wise data at the district level on a number of different categories of animals separately for urban and rural areas.

As explained in an earlier part of this series, the contribution of this sector to the GDP is estimated in terms of GVA using the production approach. The estimation of GVA involves evaluation of the products in the products and ancillary activities at the prices received by the producers and deducting from these the value of inputs of raw materials and services consumed in the process of production at purchaser's prices. In respect of operation of irrigation system by government's irrigators, the approach is used where the gross factor income generated is result of providing irrigation services is estimated. The operation of irrigation system by agriculturists is not separately taken into account as its output gets reflected in the value of output of crops and the expenditure on its operation in the overall input costs. Separate estimates of value of output from agriculture proper and livestock production are prepared and the estimates of GVA are worked out for the sector as a whole.

The area and output of principal crops are put out in the publication *Area and Production of Principal Crops*. For miscellaneous and unspecified crop groups, the estimates of output are obtained by applying an appropriate average value of yield per hectare to the total area covered under these crops. In the process of cultivation of crops, several by products are also produced but only those which are readily identifiable and have some definite economic value are considered for the estimation of GVA. The value of output from livestock is the total output of milk, group meat, group eggs, poultry meat, wool and hair, dung, silkworms, cocoon and honey (CSO 1989).

The farm output needs to be evaluated at a price which measures as accurately as possible the income which accrues to

the producer. For evaluating crop outputs at the state level, crop-wise average wholesale prices prevailing in the primary markets during the peak marketing periods are used. The average prices are used along with the production estimates available from DESAg for obtaining the value of output. In the absence of current price for any crop in a state, the trend observed in the prices of the crop in the adjoining state is used. The prices of livestock and livestock products are obtained from the same source as those for agricultural commodities. The portion of the output retained by the producer for self consumption, seed, livestock feed etc. is evaluated at the average prices. However, the quantity procured by the Central and State government agency is evaluated at procurement prices obtained from the Ministry of Food and Civil supplies.

Thus we arrive at the value of output from agriculture and allied activities from which necessary deductions are made for intermediate consumption, namely the inputs used in this sector. Information on chief inputs such as seed rates are available from the CCS and the output of dung of animal husbandry is used as the input in the agriculture sector. No separate estimates of consumption of organic manure are prepared except that of dung manure. The consumption of chemical fertilisers in particular, it is assumed to be equivalent to the quantity distributed to States by Central Fertiliser Plant, Indian Potash Limited and domestic manufacturers and this is evaluated at retail prices. Stocks with traders are not included. The feed consumption of animals used for cultivation activities as well as production of livestock and livestock products is considered as input. The irrigation departments of the Directorate of Economics and Statistics (DES) collect data on the irrigation charges payable by the farmers *in lieu* of the water supplied by government owned canals and other means of irrigation. The Central Electricity Authority puts out data on electricity consumed for agricultural purposes on an annual basis at the state level. Upto 1982-83 data on quantity as well as value of pesticides and insecticides were made available by the Pesticides Association of

India (PAI), but since then data only in terms of quantity are put out by the PAI, the value of which is estimated using 1982-83 prices adjusted for change in the index of wholesale prices.

The estimates of GVA at current prices are arrived at by deducting the total value of these inputs from the total output and then adding it to the GVA from operation of government irrigation system. The GVA from the operation of government irrigation system is obtained by the income approach method, i.e. by taking the sum of compensation of employees, operating surplus, gross provision for CFC, details of which are available from the Central and State Government budgets. For estimation of GVA at constant prices, the double deflation method is used where various items of output and input are estimated at the base year prices. In a given year, the base year price data, viz. the state average price, value of yield per unit of area are used wherever applicable and a method similar to that at current prices is followed to obtain the value of output at constant prices.

Mining and Quarrying

The economic activities covered in mining and quarrying comprise extraction of minerals in all forms from underground and surface mines, quarries and oil wells, with all supplementary operations needed to render the ores and other crude minerals marketable. Only those activities carried on at the mine site are recorded by the CSO under mining and quarrying. For calculating the value of output, the mining and quarrying sector is divided into two broad groups viz. major minerals and minor minerals. The major minerals consist of coal, lignite, petroleum and natural gas and other major minerals, i.e. metallic minerals, including atomic minerals, and non-metallic minerals. The main sources of information for major and minor minerals are the Indian Bureau of Mines (IBM) publications *Financial Year Aggregates of Mineral Production (FYAMP)* as well as *Mineral Statistics of India*, while data on inputs and output of petroleum and natural gas from the ONGC and Oil India Limited (OIL) in a proforma specially designed by the CSO.

The estimates of GVA in mining and quarrying are based on the production approach calculating the value of output of each mineral at state level and deducting from it the value of corresponding inputs. The value of output of coal and lignite as given in FYAMP publication is used directly. Since the data on output of petroleum and natural gas include elements of cess and sales tax, these are deducted from the gross value of output at Central Tank Farm (CTF) prices to obtain gross

value of output at factor cost. In respect of metallic and non-metallic minerals, the data used for estimation are usually the sale value of the mineral at the mine site or pit head. In case of captive mines, the value of output is obtained on the basis of cost of production. The CSO directly obtains the latest data regarding output of minor minerals from the state geological departments.

In respect of inputs, the value of coal is obtained from the Office of Coal Controller, while that of lignite is obtained from Neyveli Lignite Corporation Limited (NLC). The ratio of value of input to value of output as worked for NLC is assumed to hold good for lignite obtained from Gujarat Mineral Development Corporation. Inputs for crude petroleum and natural gas are obtained directly from the ONGC and OIL. Mining expenses incurred for other major minerals are worked out by the IBM, but due to certain computer processing difficulties lately, the rates of 1984-85 is assumed to hold good for subsequent years. The estimates of input costs for minor minerals are not available separately and hence are based on data available in the Report No.280/6; 'Tables with Notes on Survey of Self Employed Households in Non-Agricultural Enterprises-Detailed Results', 29th Round (1974-75) of NSSO.

The estimates of GVA at current prices for mining and quarrying are then arrived at by deducting the total value of these inputs from the total value of output. The estimates of GVA thus obtained are not netted for banking service charges paid by producers. The value of such services forms a part of the income originating in the banking and insurance sector and as such the imputed banking charges are deducted further to obtain the GVA net of banking charges. The estimates of GVA at constant prices is derived by evaluating the quantity of current year output of each major mineral at the corresponding pit-head/CIF prices of the base year. In the case of minor minerals, which are reported in value terms only, the ratio of value of output of the total non-metallic minerals at constant to current prices for each state is multiplied by the value of the minor minerals at current prices in order to obtain the value of output at constant prices. This is multiplied by the rates of mining expenses for each state as available from the NSSO report mentioned above to obtain the GVA estimates from mining and quarrying at constant prices.

Manufacturing - Registered

The entire manufacturing activities are classified into two broad sectors, viz. manufacturing - registered and un-

registered. All the factories forming a part of the registered manufacturing sector are classified into 19 industry groups as per the National Industrial Classification (NIC)-1970, which has since been revised in 1987 (NIC-1987). Data on output and inputs in respect of manufacturing sector are collected annually by the National Sample Survey Organisation (NSSO) under the ASI. The field work of the survey is carried out by the Field Operations Division of zonal, regional and sub-regional offices located in different parts of the country.

The ASI frame is based on the lists of registered factories/units maintained by the Chief Inspectorate of Factories in each state and those maintained by licensing authorities in respect of bidi and cigar establishments and electricity undertakings. Though the data collected under ASI are analysed by states and within each state by census and non-census sectors separately, the results pertaining to non-census sector are not published. All the factories that constitute census sector and the industry group at 3-digit level are completely enumerated every year, whereas those constituting non-census sector are covered in two years on the basis of 50 per cent sample in the alternate years. The unregistered manufacturing sector - being complementary to registered manufacturing sector covers all those units which are not covered under the registered manufacturing sector.

The estimates of GVA following the production approach requires estimates of value of output at ex-factory prices and corresponding value of input at purchaser's prices. The output, in the context of manufacturing sector, mainly comprises (i) ex-factory value of all products and by-products including semi-finished manufactured goods, (ii) receipts for industrial and non-industrial services rendered to others, (iii) value of fixed assets produced by the factory for its use, and (iv) net balance of goods sold in the same conditions as purchased. Likewise inputs mainly comprise of purchase value of all items of (i) raw-materials, components, chemicals, packing materials and stores actually used for the production process; (ii) fuel, lubricants, electricity, water, etc. consumed; (iii) cost of non-industrial services received from other concerns; (iv) cost of material consumed for repairs and maintenance of fixed assets including cost of work done by others to the fixed assets; (v) cost of contracts and commission work done by others on materials supplied by the factories; and (vi) cost of office supplies.

The industry-wise estimates of GVA in registered manufacturing at current

prices published in the ASI are adjusted upwardly by the ratio of employment of the non-responding factories to the total employment of the responding factories of the census sector. The estimates of GVA obtained from ASI include banking charges paid by the manufacturing establishments. The value of such services forms a part of the income originating in the banking and insurance sector and as such, is deducted from the GVA of the registered manufacturing sector. In the absence of adequate details, adjustment for imputed banking charges are made only at the aggregate level.

The estimates of GVA in registered manufacturing at 1980-81 prices are obtained by adopting the single deflation method, deflating the industry-wise estimates of GVA at current prices at 2-digit level of NIC with the relevant wholesale price indices for the year for which the ASI data are available. For recent years for which the ASI data are not available, the industry-wise constant price estimates of the latest available year are moved forward by using the relevant index of industrial production. As there is no one to one correspondence between some of the NIC 2-digit level classification and the corresponding wholesale price indices classification, appropriate price indices are worked out using weighted average of wholesale price indices of relevant items.

II

Quality and Limitations of Database

With regard to agriculture and allied activities, as crop estimates are periodically revised, along with final forecast figures, revised estimates for the preceding year are also published. However, for some of the crops in some states, final forecast figures are repeated by DESAg due to non-availability of revised estimates. Moreover, farm output should conceptually be evaluated at prices which accrue to the producer at the first point of transaction, but this is not possible in practice as the producer disposes off the product at different stages. Hence average prices worked out as weighted average of district level prices during peak marketing period is considered the most appropriate.

The estimates of value of inputs prepared by using the various sources like CCS, FAL, NSSO, DES, DESAg and others are often based on certain implicit assumptions and outdated information. For instance, the estimates of seed, diesel oil and by-products of agricultural crops from the CCS data based on 900 agriculture holdings may be a representative for all India but using the same at state level may not be justified.

That apart, it is assumed that whatever amount of chemical fertilisers is distributed by the pool and non-pool agencies is consumed; data on possible stocks are absent. The concentrates used in livestock feed are estimated from the NSSO survey results (30th round) pertaining to the year 1975-76 and may not be relevant to the later years. In respect of fodder and grass the estimates of livestock feed are based on the NSSO report pertaining to 1955-56. The data on consumption of organic manure are not available and so the output of dung manure in animal husbandry sector is taken as input of the agriculture sector. The AIDIS of 1981-82 form the main source of information for preparing estimates of repairs and maintenance charges. These surveys conducted every ten years handicap the preparation of annual estimates due to the non-availability of satisfactory annual indicators.

In the case of mining and quarrying, the FYAMP publication of the IBM provides state wise estimates of output of other major minerals with a time lag of one year. On the other hand, the IBM provides data of mineral-wise quantity and value of output at an all-India level for the current year. The estimates of minor minerals are for a calendar year and they are assumed to hold good for the financial year.

Although the respective data base for the manufacturing sector is comprehensive in regard to the coverage and sample size there is time-lag in the publication of ASI results. In the case of registered manufacturing, the estimates at constant prices are prepared by using single-deflation method, whereas the ideal method to arrive at the constant price estimates is the double deflation method which is not used for want of detailed input data base.

III

What Do the Data Reveal?

The technical co-efficients as represented by the input-output ratios convey the nature of technological changes taking place in different sectors of the economy. In the present context, data on input structure in some depth is available only for agriculture and livestock on which significant results are discernible. In respect of other sectors, the only result that can be deduced is the proportion that gross value added holds to gross value of output, which is the obverse of the proportion of intermediate consumption in the value of output.

A distinct revelation in these data is that while in agriculture, the percentage share of value added in gross value of output has tended to rise since the beginning of the 1970s, in mining and registered

manufacturing the corresponding share has declined over the decades, which in turn implies that the efficiency of input use seems to have increased over the decades only in agriculture. In registered manufacturing, there was a temporary halt to the declining trend in GVA to output ratio during the early 1980s when the relevant variables were measured both at current and 1980-81 prices. The CSO themselves have raised doubts whether the emerging trends, particularly in respect of the manufacturing sector, represent true technological changes or whether they are due to use of fresh data based on the results of periodic follow-up surveys of economic censuses, etc [CSO 1990:30]. In the case of the manufacturing sector, appropriate measurement of productivity trends is also hampered by the fact that real GVA in that sector is derived by the single-deflation method [see the debate on this subject begun by Balakrishnan and Pushpangadan 1994 and 1995]. In this sector, a part of the reason for the declining trend could be the tendency for overreporting of input costs.

Data on agriculture (Tables 16A and 16B) show significant changes in the input structure over the period. A distinct change relates to the growing importance of modern inputs in total inputs in agriculture, the share of chemical fertilisers, for instance, rose from about 4 to 6 per cent in the early 1960s to 26 per cent in the early 1990s, that of electricity from less than one per cent to 4.7 per cent, and diesel oil from one per cent to over 5 per cent. These are reflected also in the productivity of 'seeds' in that their cost in total inputs has declined from 17 to 18 per cent to about 10 per cent.

In registered manufacturing, today gross value added constitutes only about 22 per cent of gross value of output at 1980-81 prices and about 20 per cent at current prices; the corresponding ratios in the middle of the 1960s were roughly the same at about 28 per cent. Almost all industrial categories have experienced these declining trends (Tables 18A and 18B).

[This note has relied heavily on definitions and descriptions contained in CSO (1980) and CSO (1989) and to an extent the Annual Survey of Industries (various issues). The note has been prepared by Paramita Debnath and Bhagyashree Mandke and along with them Prasanth V P was also involved in its statistical computations.]

Figures in brackets are percentages to total inputs in agriculture and allied activities at 1980-81 prices

Table 16B: Value of Inputs, Output and Value Added from Agriculture and Allied Activities at Current Prices

(Rupees crore)

Year	Value of Output from Agriculture and Livestock	Total (4 to 13)	Seeds	Organic Manure	Chemical Fertilisers	Current Repairs and Maintenance	Feed of Livestock	Irrigation Charges	Market Charges	Electricity	Pesticides and Insecticides	Diesel Oil	Value Added in Agriculture and Allied Activities (2-3)	14 as Per Cent of 2	Operation of Irrigation System	Gross Value Added (14+16)
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)	(14)	(15)	(16)	(17)

***Regional Representative and Project Officers
for Lucknow and Hyderabad***

Oxfam, a relief and development agency, is looking for a Regional Representative for Lucknow and two Project officers – one to be based at Lucknow and one at Hyderabad.

The ***Regional Representative*** will provide overall leadership to the team and management of our work in the northern region, mainly in Uttar Pradesh. S/he should show that they have relevant qualifications, a minimum of 8 years of development experience preferably with NGOs, good analytical and strategic planning skills and understanding of development issues, commitment to social justice, team management experience including finance, research and evaluation, good administrative and communication skills, sensitivity to the inequalities facing women in society, ability to speak fluent Hindi/English.

The ***Project Officer posts*** require at least 5 years experience of working with NGOs in relief and development. Responsibilities include interaction with NGOs, project appraisal and monitoring and providing specific need-based development support to partner NGOs in situation analysis, perspective planning, research, evaluation and training. Knowledge of English, Hindi (for Lucknow) and Telugu (for Hyderabad) essential.

All positions require considerable travel. We offer a 2 year contract for all the posts and reasonable salaries and other benefits to attract competent professionals. Women candidates are especially encouraged to apply. ***Only shortlisted candidates for all the positions will be contacted for interviews.***

Apply with full CV and a covering letter for all posts explaining fully from your experience how you meet the criteria listed not later than ***29th December 1995***. Applications for ***Regional Representative should be sent to Oxfam (India) Trust, C-6/59 Safdarjung Development Area, New Delhi – 110 016***. Interviews for the ***Regional Representative post*** will be held in Delhi on ***29th January 1996***. Interviews for the ***Project Officer positions*** will be conducted in the Regional Offices and candidates will be shortlisted directly by them. Applications for Project Officer for ***LUCKNOW should be sent to Oxfam (India) Trust, 1 La Place, Shahnajaf Road, Hazratganj, Lucknow – 226 006 AND for HYDERABAD to Oxfam (India) Trust, 3/19 Shiva Arun Colony, (Behind Police Station), West Marredpalli, Secunderabad – 500 026.***

SEPHIS

**The South-South exchange
programme for research on the
history of development** ◀

▼ **Sephis Grants Programme**

Under the subthemes of The Forging of Nationhood & The Contest over Citizenship, Ethnicity and History and Equity. Exclusion and Liberalisation. Sephis will give special attention to the search for new identities and visions on development which arise in the South

◆ **Fellowships for Post-Doctoral Research**

In 1996, six fellowships are available for Post-Doctoral research. Funding will be provided for travel and research costs, and salary according to local standards. These fellowships extend from a minimum of three months to a maximum of two years.

Eligibility: Scholars who have received their PhD degrees, preferably within the last five years and who are employed by or affiliated to a University, a research institute or development agency in the South.

◆ **Grants for PhD Research**

In 1996, ten grants are available for PhD research. PhD grants will be provided for a period from one to three years. The proposal must include a period of research and should make clear that the applicant can realistically complete his or her draft thesis in the given time. Salaries are normally not included in the Sephis PhD grants.

Eligibility: PhD students enrolled at a university in the South, who are supported by their institution.

▷ Applications for these grants should include:

- a research proposal (maximum of 4 pages prefaced by an abstract of 100 words) presenting the research problem, reviewing the relevant literature and indicating the relevance of the research to one or both of the Sephis themes

- an academic curriculum vitae
- a letter testifying to institutional affiliation
- a referee's report (report sheets can be obtained from the Sephis secretariat)
- a budget
- a timetable

In addition, applications for post-doctoral grants should include:

- an indication of the form of publication (book, article, etc.)
- a copy of the PhD certificate

In addition, applications for PhD grants should include:

a letter of recommendation by their thesis supervisor

Research proposals will be selected by the Sephis Steering Committee, which consists of historians from different regions in the world. The applications will be evaluated according to academic quality, relevance to Sephis themes, comparative potential and contribution to South-South co-operation. The application must be received before **April 30, 1996**.

Applications should be written in English. Incomplete applications, applications by fax or e-mail and/or too lengthy applications cannot be taken into consideration.

◆ The application – and all requests about the grants programme – should be sent to:

India and FDI

The Indian government's attitude to foreign investment has evolved in the post Independence period in four distinct phases. The period from Independence to the late 1960s was marked by a gradual liberalisation of attitudes. The period from the late 1960s through to the 1970s was characterised by a more selective stance. The 1980s were marked by a certain liberalisation of policy. Finally in 1991 India liberalised its policy regime further with respect to FDI as a part of reforms undertaken to increase the international competitiveness of Indian enterprises. An analysis of the evolution of India's FDI position in these four phases of government policy and levels of industrialisation and development 3228

Hindutva and Globalisation

While the contemporary rise of hindutva can plausibly be theorised as a more or less necessary by-product of the process of globalisation, the two are also mutually contradictory. It is necessary to keep in mind these two sets of relations - the one complementary and the other contradictory rather than accept a unidimensional conception of their reciprocal involvement 3220

Hindu Men, Bigamy and Uniform Civil Code

The Supreme Court directive in the Sarla Mudgal case has strengthened the Hindutva forces, one of whose main political planks in the coming elections will be the Uniform Civil Code. The debate following the judgment has failed to address the various presumptions made by the judgment. Most important, the basic issue of bigamy by Hindu men has been sidetracked 3238

Beyond Swadeshi

Our policy makers are behaving as if liberalisation, privatisation and globalisation are the panacea for all our ills. Critics, on the other hand, are suggesting resurrection of the post-Independence policies of the closed door state controlled licence regime. The starting point in envisioning a meaningful alternative to these two positions is not, however, a passionate appeal to a modern brand of 'swadeshi' but redefining what constitutes development and reassessing what are the resources for development in a country like ours 3207

Beijing Agenda

While an attempt was made at Nairobi to deflect attention from a systemic perspective by focusing instead on particular manifestations of women's oppression, the significance of the fourth world conference on women in Beijing lies in the movement towards a building of alliances on issues which are outside what is termed "women's issues" 3195

Made for Abuse

Laws permitting non-justiciable forms of detention, such as TADA, provide enormous in-built scope for their abuse which is impossible to eliminate short of repeal of the laws. 3203

State and Markets

We do not live in an isolated world we have to be able to compete. But competition is possible only among equals. So it is essential for the state to intervene to improve the people's capabilities to enable them to compete successfully with the people of the developed countries 3191

Social Clause

While the combined opposition of the developing countries to the linking of the social clause to international trade has had the effect of deterring its enforcement, it is a matter of concern that these same governments have done little to implement ILO conventions to safeguard the rights of labour 3199

Dalit Christians

Without constitutional safeguards dalit Christians continue to stagnate on the lower rungs of the socio-economic hierarchy 3201

Failed Privatisation

The 'voucher privatisation' of state enterprises tried out in the Czech republic has failed to deal with the problem of the marginalisation of the ownership function which was the bane of economic management under socialism 3206

Death Sentence on Peasant Activists

THE People's Union for Democratic Rights (PUDR) notes with concern the Patna High Court order on December 7 upholding the death sentence on eight peasants from Aurangabad district in Bihar. The death sentence was awarded by the sessions court at Aurangabad in the case registered after 42 people were killed by the Maoist Communist Centre at Dalelchak Bhagora villages in 1987.

While such a killing needs to be condemned PUDR has grave apprehensions about the meaning such a judgment has for the struggling poor in Central Bihar. The decade from the early 80s to the early 90s was marked in the region by the growth of landlord armies organised on caste lines. A large number of massacres of dalits and agricultural workers were conducted by these armies. That these armies were encouraged and actively guided by the police is even admitted by the director general of Bihar police in a policy document submitted in 1986. But in very few of these massacres were any of the accused arrested. There were no convictions.

The killings at Dalelchak-Bhagora, too, were immediately preceded by killings at Chhoti Chhechhami village in which eight peasants were killed by landlords. No action was taken by the police to apprehend the killers. Later the accused were acquitted by the court. Had the police taken prompt action such a killing as happened at Dalelchak Bhagora would not have resulted.

A progressive law requires that a punishment should not harm the human body. PUDR opposes the death sentence since it is the last vestige of bodily harm included as punishment within our law. As a deterrent to crime it has no justification as no factual evidence has established such a correlation. In addition this form of punishment once meted out cannot be reversed while the possibility of error in judicial judgments always remains. It undermines the essence of punishments based on incarceration by excluding the possibility of reforming the guilty. What makes it worse is the context of an agrarian conflict where one party in the conflict is being singled out for this kind of harsh treatment.

Since the gradual fall of the landlord armies, the police in Bihar is concentrating more and more on direct repression. Encounters as a method of eliminating political opposition is becoming the norm. Death sentences have also been awarded recently by the sessions courts at Siwan and Jehamabad against peasant activists led by the Indian People's Front and the Mazdoor Kisan Sangram Parishad, respectively. The administration continues to

remain mute on the basic issues of wages, tenancy and land reform. In this context the awarding of death sentences becomes merely one more measure of repression against the struggling agricultural labourers.

We appeal to all people concerned with democracy to oppose this death sentence.

Doublespeak?

I READ Gopal Singh's review of P S Verma's book *Jammu and Kashmir at the Political Crossroads* (October 14-21, 1995) carefully and it is with some trepidation that I write this letter. Both Gopal Singh and P S Verma are senior colleagues and it may not be politic to cross them. Moreover reactions to a book may differ from reader to reader. What one reader considers to be engrossing and wise may not necessarily hold true for all readers. The point I wish to make here however, is not concerning the book but concerning the review.

Singh starts off by panning all available books on the Kashmir problem, calling them stereotypical and vitiated by the propaganda from the media and the government. These are serious charges and, I think should not be made in a frivolous manner. Frivolity however seems to characterise the entire review and by the end of it one is left in doubt about Singh's encomiums for Verma's book.

As compared to the existing literature on Kashmir Singh finds Verma's book to be

authentic and original. And what is it that is original? "The author (PSV)", says Singh "makes a significant observation. The collapse of civil society has thus surfaced in a big way. As a consequence of the current crisis, all political parties have become dormant in the valley. Many of their leaders have fled the valley or announced retirement or dissociation from politics and some of them have taken a pro-militant stand." Surely it cannot be Singh's case that these observations have not been made routinely by almost all observers of Kashmir in the recent past. Or is it that Singh is trying to tell us that Verma has nothing original to say in the book?

One of the basic achievements of Verma's book that Singh points out is his understanding of terrorism and state terrorism. Two paragraphs later however Singh scales down the achievement to nothing when he notices serious lacuna in Verma's argument: there are a couple of points that the author should have highlighted: (1) terrorism and state terrorism are mutually reinforcing phenomena, one feeding the other; (2) militant violence and economy of the ruling classes. What should the reader take seriously Singh's praise for Verma or the basic deficiencies in the argument of the book that he notices? Or is it that Singh is engaging in some doublespeak and his review itself should not be taken seriously?

These are merely two examples from Singh's review and many more could be easily mentioned.

Forgettable Anniversary

THE last annual report of the International Monetary Fund which coincided with the 50th anniversary of the Bretton Woods Conference, claims that the anniversary had been marked by assessment of changes in the international monetary system and a forward-looking perspective on the future of the IMF. Enough information is, however, available on the deliberations of the IMF's executive board and on bilateral country consultations under Article IV of the Fund's articles of agreement to show that there can be no hope of any radical change in the working of the international monetary system in the direction of a more equitable world economic order and that the Bretton Woods institutions have reached their final destination of subserving the economic and ideological interests of the US in particular and the rich nations in general. Given the dominant influence of the US and the other industrialised countries in the voting arrangements of the IMF and the World Bank, it was perhaps simple minded to expect any other outcome. The forums of the IMF and the World Bank have been increasingly used for legitimising and providing a multilateral umbrella for the pursuit of the advanced countries' interests.

The IMF, it would appear, is being stripped of the modicum of objectivity necessary to project world economic developments with relative accuracy. Its 1994 annual report had talked of the Fund's executive directors expressing 'admiration for the dramatic transformation of Mexico's economy in recent years against the background of a "continued surplus of public finances, a reduction in inflation and further progress in structural reform, as well as a decline in the external current account deficit by more than 1 percentage point to 5.7 per cent of GDP which was more than fully covered by capital inflows"'. The Fund's board further "commended the [Mexican] authorities' efforts to consolidate the structural reform process through the further opening up of the economy, the formal removal of most restrictions on foreign investment and the approval of laws granting autonomy to the Bank of Mexico". But all this was soon exposed as sheer hype and the IMF's 1995 annual report talks of 'the financial crisis in Mexico as "the dominant single event of the anniversary year", while claiming that the crisis had "called forth a response from the Fund that was both swift and massive"'. The \$18 billion given to Mexico is the largest financial support ever extended by the Fund to a single country, but the IMF board was steamrollered into doing this because of Mexico's position as the backyard of the US and because the interests of the multinational banks of western countries were vitally involved. The contrast with the treatment of the former Soviet Union could not be sharper. The Russian Federation and Ukraine initially were given hopes of a massive assistance

of \$50 billion by the IMF and the western powers but they were finally dashed to the ground necessitating massive compression of economic activity and the imposition of untold sufferings on the people.

Similarly, the 1994 report of the IMF failed to anticipate the turbulence in government bond markets in February and March 1994 when a prolonged bond market rally since 1990 was abruptly reversed and the declining long term rates of interest began to move up rather sharply. This is now linked to a major revision of expectations about economic performance and about the course of interest rates and exchange rates in the industrial countries. Whereas the 1994 report had anticipated a more modest recovery in the world economy, the latest report brings out how the world economy rebounded strongly in 1994 with total output rising by 3.75 per cent. The robust growth was to a great extent foreign trade-led with expansion of the volume of world trade crossing 9 per cent, well above the 5.5 per cent average of the past two decades. Even as the 1994 report had been overwhelmed by the slowness of recovery in world output and trade, the 1995 report is carried away by the strength of the upturn. Despite the rapid growth in countries where the cyclical upswing began earlier (US, Canada, UK, Australia and New Zealand) and despite the beginning of recovery in Europe, the situation relating to unemployment, decline in average labour earnings and inequalities of incomes and assets seems to have deteriorated all over the western world. Each recovery-recession cycle is leaving behind higher levels of unemployment and greater degrees of inequality. The IMF's 1994 report had at least mentioned that the rise in unemployment which was cyclical in origin, might prove difficult to reverse and might lead to a further rise in structural unemployment, but this year's report makes only a passing reference to possible decline in unemployment.

The review of the performance of the Fund and its future role has similarly produced nothing of substance. Some 25 years ago when the Bretton Woods fixed exchange rate system collapsed, the then Committee of Twenty (C-20) on the reform of the international monetary system and related matters had strongly urged that a permanent and representative council of governors having decision-making powers to manage the monetary system should be established, in addition to the existing board of governors and the executive directors. The Interim Committee, the successor to the C-20, was intended to be an interim arrangement but continues after more than two decades. The C-20 had provided an 'outline of reform' which pointed to the direction which the international monetary system should take. It had envisaged (a) an effective and symmetrical adjustment process including better functioning of the exchange rate mechanism with the

exchange rate regime based on stable but adjustable par values and with floating rates providing a useful instrument in particular situations (b) co operation in dealing with disequilibrating capital flows (c) introduction of an appropriate form of convertibility for settlement of imbalances with symmetrical obligations on all countries (d) better international management of global liquidity with the SDR becoming the principal reserve asset and the role of gold and of reserve currencies being reduced (e) consistency between arrangements for adjustment convertibility and global liquidity and (f) promotion of net flow of real resources to developing countries

Though these were unanimous recommendations of the C-20 consisting of representatives of developed and developing countries, the IMF has ducked all these substantive issues over the years. There has been a general recognition that a large deterioration in the fund liquidity was likely over the next two years. Simultaneously, the Mexican crisis had shown the vulnerability of members to sudden shifts in sentiment and resultant large and unpredictable capital outflows. Yet the prolonged deliberations for the tenth general review of fund quotas was conducted in the anniversary year without finally recommending any increase. The 1995 annual report mentions nonchalantly that the IMF Board will carry forward its work on the eleventh general quota review. In its April 1995 communique, the Interim Committee had likewise noted that there had been no agreement on allocation of SDRs, despite the IMF staff and managing director recommending to the board a substantial allocation.

According to the annual report on the 50th anniversary the board specially discussed the scope for improvements in the current international monetary system. Three specific issues discussed related to exchange rate volatility, globalisation of capital markets and implications for fund surveillance. There was wide agreement that exchange rate volatility among the major reserve currencies was often excessive, that this had a negative effect on international trade and investment and that the developing countries suffered the most in the process. Even with full co operation on policies, there would be significant fluctuations in exchange rates not because of differing economic fundamentals but because of the integration of capital markets and massive cross border flows. Therefore, a system of target zones or reference ranges has been perceived as a useful disciplining arrangement for the larger economies. The advantages of even a more formal pegged system with periodic adjustments have been emphasised in the IMF board as a pragmatic step towards greater exchange rate stability. For all the lip-sympathy

no substantive decisions have been taken, instead everything has been left to be taken care of by pursuit of appropriate domestic policies which would hopefully ensure long-term macro economic stability even as the costs of short term volatility are minimised through the use of hedging instruments in deep and broadly based financial markets. Wide and deep international capital markets are also expected to bring about effective allocation of global saving and investment. Against this background of diverse exchange rate arrangements and immense stocks of mobile capital, the surveillance role of the IMF has become much more challenging and this requires an appraisal of the domestic monetary, fiscal and structural policies of the G-7 countries. Above all, there remains the age-old problem of a complete lack of symmetry between the rich and the developing countries. So long as that issue is swept under the carpet in the operations of the IMF, the instability in the global economic environment will persist with severe adverse repercussions on the economies of the poorer countries.

POLITICS

Special Treatment

ALTHOUGH the government swears by 'modernisation of the economy and democracy in its politics', it shamelessly flaunts the most hideous colours of an antiquated feudal order in its daily behaviour where the privileged few are treated under one dispensation and the rest of the people under another.

Not to speak of the crores which are spent on the security of the VVIPs, we are now being told officially that these Indians of a special category are also beyond the purview of the law of the land. Close on the heels of the scandal surrounding a union minister who did not declare goods worth over Rs 1,00,000 at the Indira Gandhi International Airport on his return from a foreign jaunt some time ago, another disclosure involving top politicians and bureaucrats has shocked the capital. A question in the Lok Sabha recently evoked a reply from the ministry for urban development which reveals that at least 65 important politicians, bureaucrats, senior police chiefs and judges, among others, who continued to occupy government accommodation beyond the time allotted to them, owed the government Rs 1.58 crore as penal rent. Under the law those overstaying in government bungalows or quarters are unauthorised occupants and are required to pay a penal rent from the day they extend their stay. But these 65 VVIPs (the arrears against each of whom range from tens of thousands to lakhs of rupees) have not only been relieved of the responsibility

of paying the penalties, but some have also been allowed to remain in unauthorised occupation of the accommodation by the government.

The list of the defaulters is a multi-political one, headed by the former union minister and powerful Congress leader of Delhi, H K L Bhagat (whose rent arrears of Rs 15,73,376 have been written off) followed by another high-profile Congressman Vasant Sathe (Rs 6,97,889), who now heads the prestigious Indian Council for Cultural Relations. We also find in the list the BJP stalwart V K Malhotra (Rs 2,09,913) and the former union minister from the Janata Dal Mufti Mohammed Sayeed (Rs 1,08,454). Not to be left out, top civil servants have also joined the impressive list which includes the current commerce secretary in the central government Tejinder Khanna (Rs 1,09,628), the present secretary-general of the Rajya Sabha Rama Devi (Rs 93,936), the present Election Commissioner G V G Krishnamurthy (Rs 22,938) and the former science adviser to the defence minister V S Arunachalam (Rs 3,63,121). To cap it all, the judiciary which is supposed to see to it that such illegal misuse of government accommodation does not go unpunished, is represented on the infamous list by three of its senior members: justices Mahesh Chandra (Rs 5,50,202), M K Chawla (Rs 1,78,260) and B N Kirpal (Rs 40,005).

While the administration and its minions display a ruthless zeal in evicting almost every day urban labourers from so-called unauthorised slums, and villagers from their homes on the plea of building dams, they have consistently refused to take action under the Public Premises Eviction Act against these VVIPs. Instead, the government has carved out a bureaucratic back-door in its steel-frame through which it seeks to protect them from prosecution and allow them to enjoy the fruits of their misdemeanour. An official body called the cabinet committee on accommodation (CCA) is reported to have been given the discretion to allot government houses out of turn, to fix rates of rent and to waive arrears. It has been elevated almost to the status of a defence ministry or home intelligence outfit, as evident from the statement made in parliament on December 7 by the minister of state for urban development R K Dhawan, who said that the "composition and proceedings [of the CCA] are secret in nature and as such cannot be furnished". A week later, the ministry came out with a further clarification saying that the decision to allow a particular person to continue occupation of accommodation after the stipulated period was over was "based on a variety of reasons". Since the CCA proceedings are secret, there is no public accountability and the people have no right to know

what are the 'reasons' which have prompted the government to show undue favour to these VVIPs

KASHMIR

Hidden Damage

THAT wars and insurgency take a toll of human lives and livelihoods, not only of the antagonists but of those uninvolved, is well accepted today. Trauma care as a speciality in medicine owes much perhaps to the violence which is endemic in times of 'peace' and war in many parts of the world today. What is however less documented is the often permanent psychological damage which accompanies civil and military disturbances over a long period.

The reasons for this near silence about psychological trauma related to strife are complex. The most innocent explanation is that the science of mental illness, if one may call it that, is a neglected area of medical practice. The roots of this neglect go back to the mind/body separation in medical science. This ill-developed field is even more neglected in the poorer countries. It has been seen as the least needed of specialities in these countries, both by the establishment and by those who critique it. And yet psychological trauma is a common enough problem which needs special care and attention. While the distress resulting from the state's failure to provide food, shelter and work cannot be treated by medical specialities, the trauma resulting from the more direct ways the state employs to suppress social (and political) dissent can and needs to be documented and treated. Only now, through the efforts of medical activists, is an attempt being made to develop facilities for the care of victims of torture.

The non-recognition of psychological problems as constituting medical issues has had damaging fall-outs. In Bhopal, for instance, although there have been studies which have documented the long-term and permanent effects that the victims, a large number of them children, have suffered, these have not been accepted as compensable injuries.

It is against this background that recent reports from Kashmir of the sharp increase in the number of people seeking help from psychiatric departments in hospitals must be read. In 1990 the Srinagar Medical College's psychiatric department saw 1,528 patients; by 1994 the number had grown to 38,000. A large proportion of the patients are children with problems as diverse as undiagnosed pains, hysteric behaviour or plain terror at loud sounds. Schizophrenia, depression and unprovoked violence are some of the other symptoms and syndromes. The range of mental

distress is not always directly related to episodes of violence, but also arises from restrictions on movement, being forced to change patterns of behaviour or life styles, uncertainties at work and general suspicion surrounding what used to be normal activities of daily living.

The actual numbers, of course, represent a minuscule proportion of those who cannot access medical care facilities, either because they are not available or because those affected are too scared. In fact, that even so many do come to the hospitals, psychiatric clinics is itself rather surprising, perhaps due to the efforts of doctors to refer them to the departments and perhaps because the stigma attached to psychiatric care does not for some reason seem to be as great a deterrent here. During the height of the 'Punjab problem', for instance, while groups of activist doctors recognised the need for these services, often they were themselves patients – the public hospitals and the state system did little to help.

The issue here is that no matter how the socio-cultural/ethnic/political problems which give rise to militancy are worked out, no attention is given to the psychological rehabilitation of the population. While resolution packages work out political, economic, social and even cultural guarantees, it is always assumed that once violence and the threat to civilian life cease, there is a return to normalcy all round. The sad fact is that psychological and emotional damage arising out of years of military action and insurgency and militancy, among those who were part of the action and those who were not, are often irreparable, making the establishment of a just society even more difficult, unless progressive people's movements acknowledge the issues and evolve ways of dealing with them.

MAHARASHTRA

Fight for Co-operatives

THE prime minister's reported decision to release Rs 600 crore for the co-operative sector in Maharashtra comes on the heels of the SS-BJP government's compromise with Sharad Joshi over the demands of sugarcane producers in the state. While both these developments are responses to the crisis the co-operative sector in Maharashtra is facing, the political calculations underlying them preclude a solution to the deeper malaise afflicting the sector.

Sugarcane cultivators in Maharashtra have been agitating under the banner of the Shetkari Sangharsh Samiti in Satara, Sangli and Kolhapur and of the Shetkari Sanghatana in Marathwada for securing Rs 1,000 per tonne of cane for 1994-95 and Rs 1,100 per tonne for

1995-96. In 1993-94, when sugarcane production was lower, the sugar co-operatives paid more than Rs 900 per tonne to the farmers. But with the bumper harvest of sugarcane in 1994-95 (continuing into 1995-96), the government has at present an extra stock of 50 lakh tonnes of sugar. As a result, the factories scaled down the price of cane by Rs 150-200 per tonne. For the farmers, on the other hand, the prices of inputs, especially of fertilisers which form 40 per cent of the overall input cost, have been increasing at a faster rate than the cane prices. The reduction in cane prices thus made it difficult to meet production cost, leading to discontent among cane producers.

The Maharashtra government has agreed to lift for one year the zoning restrictions on cane producers who are not members of a sugar co-operative. The decision, if extended to producer members of co-operatives, will have major consequences. It is true that sometimes the zoning restriction has been misused. Factory managements have declined to purchase cane from farmers who had not voted for them in elections to the management boards of the co-operatives and instead taken in cane from far-off places. Nevertheless, complete withdrawal of zoning restrictions could ultimately end in dismantling the co-operative structure completely. The producer member of a sugar factory not merely sells cane to the factory but also owns its shares. Assured supply of cane is vital to the well-being of the factories. If zoning restrictions are removed, cane will flow where better prices are offered. As a result, the condition of sick factories which are not in a position to offer a competitive price will further deteriorate. But perhaps such an outcome fits the game plan of the SS-BJP government which ever since coming to power has been bent on loosening the Congress grip on the co-operative sector in the state.

The prime minister's decision to pump in money to keep sugar factories and co-operative banks going too is a temporary remedy. A long-term solution would entail disciplining of the co-operative managements. Diversion of funds – partly derived from the cuts the farmers are forced to accept on such pretexts as the chief minister's fund, environment development fund, sugarcane development fund etc. – for personal gain or for political purposes has to be stopped. Recently the factories to reduce their costs have not been extending the facilities of sugarcane cutters and transportation to their member farmers, whereas expeditious transport of cane from the farm to the crushing site would maximise extraction of sugar. But measures for the betterment of the co-operative sector will hardly be given priority by the state government whose objective is to enfeeble the Congress bastion in the co-operative sector as much as possible before the Lok Sabha elections.

Behind Budget Dispute

A correspondent writes

THE stand off between the US president and his opponents in the US Congress should be of interest to us in India for at least one reason namely the fiscal deficit as we call it here. While the parties to the dispute have temporarily reached a sort of truce over the time frame within which the deficit has to be eliminated they are taking positions which are far apart at least seemingly so on not only the proposed estimates and underlying assumptions but also the manner in which the deficit has to be reduced. President Clinton had a 10 year target whereas the US Congress wanted to balance the budget in seven years. Now it has been agreed between the two sides to work towards a balanced budget within seven years.

It is noteworthy to start with that the two sides are one on working towards a budget balance—a budget in which *all* government expenditure will be met from government revenue and no amount will have to be raised by way of borrowing domestic or foreign. In this context it is well to remember by way of background that the US government's deficit (in absolute terms) is almost half of what it was in 1992 (the deficit for 1995 is \$ 164 billion against \$ 290 billion in 1992) as a proportion of GDP it is less than half of that in 1992 (2.3 per cent against 4.9 per cent). Even the US debt/GDP ratio is coming down—it is only 51 per cent though the figure of \$ 3.6 billion of public debt looks formidable.

Now while both Clinton and the Republican Congress are agreed that the budget has to be balanced and resort to borrowing altogether dispensed with the dispute as already stated was not about just the time frame and the manner of balancing of the budget. With agreement on the time frame of seven years the focus hereafter will be on what items of government expenditure to cut. Here it should be added that neither party speaks really of raising revenues though some of the proposals like the Republican one to reduce or eliminate the earned income tax credit would have this impact while raising income tax on an estimated 44 million low income households earning less than \$ 30,000 a year. In fact the Republicans insist on giving major tax-breaks to the corporate sector which would cost the exchequer some \$ 245 billion over the next seven years.

So the dispute is about the items to be axed. While the Republicans want to slash Medicare and Medicaid knowing fully well that as it is some 20 per cent of US families go without health cover in addition to educa-

tion and environment protection, the president proposes to achieve the budget balance by virtually putting a freeze on expenditure growth under these heads. In other words even the latter proposal would amount to a real cut but at a slower pace. Basically the president does not favour further tax-breaks for corporate America. Neither side speaks of cutting defence spending—cold war or no cold war.

In the circumstances is it any wonder if the world at large should want to know what

the big dispute is about except tax-breaks for corporations which the Republicans would like to finance by taking money out of the pockets of the poor directly through eliminating the earned income tax credit and indirectly through reducing drastically their health care. Budget balance appears to be a mere slogan that both sides raise for public consumption. Public memory is proverbially short. So no one remembers that under Reagan and Bush two Republican presidents the deficit had more than doubled.

Institute of Rural Management, Anand

INVITATION FOR COLLABORATIVE RESEARCH ON

Rediscovering Co-operation

IRMA is commissioning a year-long research programme leading to a national seminar on **Rediscovering Co-operation** in November 1996 at IRMA. This is a part of the Golden Jubilee Celebrations of the Kheda District Cooperative Milk Producers Union (AMUL).

Academic scholars, leaders of co-operatives and practitioners are invited to write analytically rigorous conceptual/empirical papers on any of the following themes:

- Bases of Co-operation** lessons from various disciplines—economics, ethics, sociology, psychology, law, history, systems theory, game theory, organisation theory, etc.—on the importance of co-operation and the conditions necessary for the emergence and success of co-operation.
- Strategies for the Models of Tomorrow** based on successful grass-root level experiments in specific sectors, formulating a proposal and a strategy for a large scale programme for promoting co-operatives and
- Co-operatives in the Emerging Context** implications of the emerging trends in economic, social, political, technological, and other environments for the management of co-operatives.

- * Honorarium and limited financial support for research is available.
- * Papers, accepted for the seminar after a rigorous review process, are to be brought out in an edited volume.
- * Papers are to be submitted on or before July 31, 1996.

ITC

Sustained by Tobacco

IMPERIAL TOBACCO COMPANY (ITC) with diversified interests in tobacco and cigarettes, financial services, hotels, paper and paperboard, packaging and printing and agri and international business was 100 per cent foreign-owned till until 1954. Over the years this composition changed following a series of public issues coupled with disinvestment of shares by foreigners. Today BAT has a 31.6 per cent stake in ITC. 37 per cent is held by the financial institutions with the rest by the public.

The company closed the financial year ended March 1995 with a sales turnover of Rs 2,834 crore against Rs 2,352 crore in the previous year. Other income rose by 36 per cent from Rs 69 crore to Rs 94 crore taking total income to Rs 2,497 crore from Rs 2,374 crore. Interest costs came down by 36 per cent from Rs 131 crore to Rs 84 crore.

In spite of the discouraging performance from some of its business divisions, namely international business, agri business and aquaculture which dented the bottomline by Rs 120 crore, the company carried on with an exceptional performance by the tobacco division coupled with the help from other income. ITC's cigarette tobacco division recorded sales of 50 billion sticks for the year, the highest ever. In March 1995, its market share stood at 60 per cent. The Bingo segment introduced by the company constitutes 13 per cent of the industry and the company has a 56 per cent share of this segment. ITC's leaf tobacco division diversified its market during the year under review. The company's plants at Chirala and Anarpati have been accredited with ISO 9002 certification. Surya Tobacco Nepal, a 49 per cent ITC company has been performing well. With a 56 per cent market share, it is the largest private sector corporation in Nepal. The company's Triveni tissues division completed its technology upgradation at a cost of Rs 100 crore. The installed capacity of the mill has now increased to 33,000 tpa from the level of 13,500 tpa. An increase in the input costs and resultant price hike in the international pulp market was successfully combated through R and D activity resulting in an increased usage of unconventional raw material and new products.

The packaging and printing division of ITC converts over 30,000 mt of paperboard into value added packaging for consumer goods industries like cigarettes, liquor, foods,

tea and beverages, matches, personal products and others both in the domestic as well as overseas markets.

An impetus to exports was the rationale behind the setting up of the International Business Division. The company did have its share of wrong decisions notable among them being rice exports to Sri Lanka at prices considerably higher than international prices which led to high export receivables, a significant quantum of receivables being uncertain of recovery leading to provisions in the accounts for the year under review.

The company entered the finance sector with ITC Classic Finance and the company has already established itself as a leading player.

In spite of the prices moving up by more than 30 per cent over the previous year's level, the company's flagship brand Sundrop registered a growth of 15 per cent on account of a renewed marketing thrust and segmentation. During the year under review, the company transferred its seeds business to a joint venture company, ITC Zeneca, with a 50:50 equity participation by ITC and Zeneca Plc of UK.

The hotels business was restructured and ITC Hotels was made the licensed user of Welcomgroup and was given the whole responsibility for operating and marketing the Welcomgroup chain of hotels. During the year under review, the Welcomgroup chain achieved a turnover of Rs 227 crore, registering an increase of 32 per cent and earned foreign exchange of Rs 137 crore.

The company continued its thrust on the use of information technology and information systems in supporting and conducting its various operations as also its investment in upgrading its technology. For development and value addition to the unutilised assets of the group, the company has promoted Greenacre Holdings. The customer base has been primarily among institutions and corporates.

The company has decided to diversify into biscuit manufacturing. A wholly owned subsidiary, United Biscuits, has been formed in Bangalore to enter into the biscuit manufacturing business. Apart from manufacturing biscuits, the company will also manufacture cookies.

The company proposes to invest Rs 550 crore to modernise and upgrade its four cigarette factories over the next five years, with emphasis on productivity and quality, new packaging styles, and improvement of the working environment. Shifting of the Bangalore factory to the city's outskirts will form an important part of this programme.

ITC has entered into an MOU with Eagle

Star for insurance services in India but the two are yet undecided on how the equity is to be split between them. The principal focus area for the joint venture is going to be large industrial risks. The area of health insurance is also being considered.

VST INDUSTRIES

Foray into Horticulture

VST Industries, a Hyderabad based company having a common parent in UK based BAI with ITC, closed the financial year ended March 1995 with a turnover of Rs 635 crore up by 11 per cent from Rs 570 crore achieved in the previous year. Other income surged to Rs 10 crore up by 28 per cent from Rs 7 crore. The total income earned by the company rose by 13 per cent from Rs 574 crore to Rs 646 crore. Interest costs rose by 7 per cent.

The exports of the company stood at Rs 11 crore, a decline compared to the preceding year while imports rose from Rs 3 crore to Rs 8 crore. The decline in exports has been attributed to slack demand. West Asia continued to be the largest market for the company's exports. The company for the first time exported 191 tonnes of processed tobacco. The total exports of cigarettes and processed cut tobaccos by the company registered an impressive increase from Rs 3 crore in 1993-94 to Rs 5 crore in 1994-95. In December 1994, the company was granted a certificate by the ministry of commerce recognising it as an export house for a period of three years commencing April 1994.

The company successfully marketed two new brands during the year under review. With a view to strengthening mass appeal, the company is sprucing up its brand image with stress on both packaging and blends. Strengthening of the distribution network was also high on the company's agenda during the year under review.

The company is making a foray into the horticultural business. VST Natural Products is setting up a processing plant with an investment of Rs 30 crore for dehydrated spices, spice products, natural food colours along with dehydrated vegetables and fresh products. The principal raw material will be sourced from the processing of taprika. The company will support taprika cultivation in the areas where it supports tobacco farmers. The project will be financed through internal accruals and bank borrowings with a debt-equity ratio of 1:1. The company had no plans to tap the capital markets to finance the diversification. The red coloured natural

agent will be exclusively exported to Europe and North America where natural colourings are getting popular. The plant is expected to go on stream by end January 1996. The company has renewed its consultancy agreements for agronomy with High Value Horticulture of UK and Asia Ventures International of Israel.

BRITANNIA INDUSTRIES

Modernisation Programme

Incorporated in 1918, Britannia Industries specialises in the production of bread and biscuits and export of cashew kernel, sea foods etc. It also manufactures computer software as well as soft drink beverage base for Coca-Cola, Sprint and Fanta. Nushi Wadia chairman and the company's French partner, Group Danone, hold about 44 per cent of the equity in Britannia Industries with 27 per cent being held by financial institutions and the balance 29 per cent by the public. The company is a leader in the biscuit market.

The company's performance has to be assessed in the light of hike in excise duty, a surge in sugar prices, imposition of dual point sales tax in some states and arbitrary allocation of subsidised wheat to its main competitor. Timely action in terms of sales support, cost savings and rationalisation saved the day for the company.

The company closed the financial year ended March 1995 with a sales turnover of Rs 501 crore, up by 16 per cent from Rs 431 crore in the previous year. Aided by rise in dividend and interest earnings, other income rose by 81 per cent taking total income to Rs 519 crore, up by 23 per cent from Rs 421 in the previous year. Interest costs rose by 5 per cent.

The company's strategy was to move away from the commodity business and build up a sound base of branded exports. The company curtailed export of soya meal and cashew nuts and rationalized its frozen sea food activities as a result of which export turnover was sharply reduced. The company has concentrated on biscuit exports where it has entered new markets like Bangladesh and Burma. Exports stood at Rs 11 crore, down by 53 per cent from Rs 23 crore in the previous year.

The company plans to spend Rs 175 crore on updating the manufacturing and packaging systems in its various factories. The programme expected to be completed in about two years, will help reduce costs and enhance the product range. Part of the funds will come from the \$20 million loan sought from the Banque Nationale de Paris. Britannia Industries has imported certain international recipes with adaptations to suit the Indian tastes.

CURRENT STATISTICS

EPW Research Foundation

Deposit mobilisation by banks continues to be tardy but their lending is growing apace. Galloping net RBI credit to the centre has led to sizeable currency expansion. The capital market remains depressed with all major equity indices showing an over the year fall of 20 to 40 per cent. In the external sector the rupee is slipping with the dollar rate touching Rs 34.80/34.90. The rupee depreciation has narrowed the spread between domestic and international prices of gold to around 16 per cent (20 per cent earlier). Gold import has nevertheless touched phenomenal proportions with approximately 288 tonnes imported during January-September 1995 (225 tonnes in the same period of 1994). Legal imports of gold of 178 tonnes in the first three quarters of 1995-96 almost equal total legal imports in all of 1994.

Capitalism, Markets, Market Socialism and Democracy

Arun Ghosh

We do not live in an isolated world, we have to be able to compete. But competition is possible only among equals. So it is essential for the state to intervene so as to improve the capabilities of the people to enable them to compete successfully with the people of the economically developed countries

WRITING in late 1995 and quite contrary to popular beliefs and perceptions, one can safely assert that barely five years after the collapse of communism in Eastern Europe and the former Soviet Union, the inner contradictions of capitalism are beginning to surface in all developed capitalist countries and that there are unmistakable portents in Eastern Europe of a popular desire to go back to some form of socialism other than the dictatorial regimes that had existed prior to 1990. Indeed, it would also appear, if history has any lessons for the future, that the left parties in India need to re-examine some of their basic assumptions and the philosophic roots of their ideology, their tactics and their longer term goals.

Consider the facts. Forget the Newly Industrialising Countries (South Korea, Taiwan and of late Malaysia, Indonesia and Thailand), the city states of Hong Kong and Singapore should be excluded from this list as they are exceptions which cannot lay down the future development pattern of less developed countries. The developed capitalist world today is undoubtedly in a deep hole. Japan, the ideal extolled by many writers and emulated by many countries (like South Korea) is now beginning to reel under the shock of the inevitable aftermath of finance capital running ahead of the real economy. Japan does not typify the 'boom-and-bust' experience of the US in 1929, yet there is no doubt that the Japanese economy is in some trouble. The Japanese real economy, as of today, continues to be strong, and its strength may help it overcome its financial distress if the US and Western Europe do not turn 'protectionist' (as they well might), but that is not what we are discussing.

Consider Western Europe. France, as of the writing, is in a deep hole, with the nation almost paralysed by the general strike called by those manning the public services, with support from the people in general. The reason is simple. The tendency observed earlier, in the US and the UK, of whittling down, in fact dismantling social security and 'welfare' measures that had once given credibility to the capitalist system, has now been suddenly pressed hard on the French

people with sudden fury by Jacques Chirac and Alain Juppé. It is ironic that when the cold war was at its height, the capitalist system quickly adapted itself into a 'welfare economy'. Indeed, soon after the second world war, the capitalist system transformed itself, perhaps to counter the threat of the appeal of communism. The widespread adoption of social security and other 'welfare' measures, the influence of 'liberal' thought which focused on political democracy leading on to the fostering of a democratic society, made the capitalist mode of production take on a humane approach, and the progress made by the industrialised developed countries of Western Europe and the US after the second world war stood out prominently. It was loudly proclaimed by 'liberals' like Ken Galbraith that the beauty of capitalism is that it is adaptable. That capitalism did adapt itself (as far back as 1933 in the US under Roosevelt, but especially under the Labour government in Britain after 1945) that the social democracy practised in the Scandinavian countries led to high rates of growth with equity are all historical facts but today they are only part of history.

LIBERALISM UNDER ATTACK

Even before the collapse of the communist countries in Eastern Europe, liberalism came under attack under Reaganite US and Thatcherite UK. The glorious days of capitalist growth in the 1950s and 1960s - partly (though only partly) made possible by the availability of cheap oil as a source of energy for the developed countries - had a rude shake-up with the two 'oil shocks' of the 1970s. And though the developed countries reacted with inventions and innovations leading to significant oil conservation, their recovery was greatly assisted by the dramatic deterioration of the terms of trade of developing countries which were dependent on the export of 'primary products'. The gain of the oil rich countries came eventually at the expense of the exporters of primary commodities, not of the developed industrialised countries. That, again, is a historical fact.

And yet, the stagflation of the 1970s had

its roots elsewhere: the continued payments deficits of the US, the announcement of the non-convertibility of the US dollar to gold at the fixed price of \$ 35 per Troy ounce, and the consequent breakdown of the Bretton Woods system preceded the first oil shock.

The 1970s saw the industrialised countries of the west focusing on price stability as the most important desideratum of policy, and this was the beginning of an attack on public spending on welfare. The Hayek in principle of minimum government as the best led to a spurt of privatisation under Margaret Thatcher. In the US, under Ronald Reagan, supply side economics, the reduction of tax rates to bolster consumer spending - which always lags behind production capability under the capitalist system - came to be the accepted policy. Essentially it was the power and strength of those controlling finance which came into play. In the US, deregulation of banking and of finance companies has led to high costs to the tax payer, but that was passed. The chorus of voices of reaction was against public spending on welfare, against regulation of all types, and it continues to be so even to this day. And now, under Jacques Chirac, the French have decided that in order to make the French franc and stable currency vis-à-vis the German mark, France has to have major cuts in welfare and social security expenditures. The hope of a common European currency, which was shaken by the devaluation of the British pound and the Italian lira earlier, must be kept alive no matter what the costs are to the French people.

Consider the facts again. Western Europe has as of now an unemployment rate exceeding 10 per cent of the labour force. United Germany, the leading light of the ECU, has an unemployment rate of 10 per cent. France has an unemployment rate of 12.5 per cent, and the UK of 12 per cent. (Spain has the dubious position of heading the list with 20 per cent of its workforce unemployed.) And though even the socialist Mitterrand had initiated cuts in welfare spending, Chirac has decided to make the axe fall sharply on the working classes in order to drastically cut government spending, so as to balance the budget and to steady the franc.

The reality is that governments (in capitalist countries) are no longer free to pursue nationally desirable policies, to promote employment, to increase the welfare of their people. The ascendancy of finance capital, the capital account convertibility of currencies, and the quick and easy transferability of large volumes of floating funds across borders, make a mockery of domestically oriented economic policy-making. Essentially, economic policies in developed countries of the west are ruled by a few who control liquid (and highly mobile) finance capital. No

wonder, the inner contradiction of capitalism – that consumption can never keep pace with production capacity – has come to the fore once again in a stark manner. Even in tradition-bound Japan, unemployment has grown from about 1 per cent of the work-force to more than 3 per cent, in less than two years, while the volatility of the stock market has left many (hitherto strong) institutions in a deep hole facing enormous capital losses.

Consider some more facts. Communism first came to Russia, not as a transformation of a mature capitalist economy into a socialist one, but as a feudal country which suddenly shook off its feudal government and opted for a communist dictatorship. In China and Viet Nam likewise – as also in Cuba – communism emerged as a result of the exploitation of the people by the feudal lords (and in China and Vietnam as a result of the native feudal lords either unable to resist external aggression or collaborating with foreign powers, denying the people a voice in their own governance).

It is not necessary to go into the reasons for the collapse of communism in Eastern Europe; there are diverse factors both internal and external, and one must accept the greater importance of internal factors in any such process. What is interesting, however, is that Poland – the first country to repudiate communism – has democratically elected former communists back to political power, despite the strong support given by the clergy (in a highly religious Polish population) to anti-communist Solidarity leader Lech Walesa. Poland, for one, appears to have repudiated the policy of a return to international market capitalism.

Obviously, no country Poland included would plan to return to the type of regimented economy that had come to be established over 1945-89 in the East European countries. And yet Poland's repudiation of market capitalism is significant. What kind of economy then are they likely to establish? There is a possibility that all the East European countries may be opting for a 'welfare state' with state ownership of the *major* means of large-scale production – in other words, some variant of what has come to be known (in many countries) as 'market socialism'. Employment guarantee and/or significant social security and the widespread supply of public goods would be one possible variant.

MARKET SOCIALISM

Is market socialism then a possibility? Strictly in theory, the market system is incompatible with socialism. The market system works on the basis of incentives (profit-making) and disincentives (the threat of the sack and unemployment) signalled by the market, all economic agents taking their cue from market signals. Again, the market system must – if market signals are truly

followed – lead to inequalities in income distribution – and thereby lead eventually to effective demand falling behind production capacity. The Rosa Luxemburg thesis of underconsumption leading to unemployment is an axiomatic consequence of a free market. It is this that Keynes had endeavoured to obviate and overcome, but Keynesian policies got discredited in the 70s because of the onset of stagflation in Western Europe. And now the liberal Galbraithian paradigm of a 'welfare and social security' regime within the capitalist system appears to be in disarray. In the context of fierce international competition, the social democratic forces (of the Scandinavian variety) also appear to be in retreat. In any case, one must acknowledge that markets are not compatible with socialism.

This is the dilemma: indeed, this poses a problem for left thinkers who need to rethink certain basic ideological and conceptual issues. We may leave these thoughts for theoreticians and ideologues, though one must repeat that left thinkers need to rethink and rework some parts of their ideology. For one must accept as a starting point that Marx's prediction of mature capitalism turning into socialist economies has been disproved historically. But then Marx was not a determinist, though unfortunately many of his followers appear to be so. The Marxian thesis of progress being a dialectical process cannot be said to have been disproved: in fact, increasingly more and more scientific discoveries tend to confirm the dialectical process of even nature, the minutest human body cell is all the time interchanging sodium and potassium in our blood stream every second of the day and night, all through life.

Secondly, historical materialism also does not appear to provide the sole answer to

human actions and human progress. The economic motivation is an important – an extremely important – one in our activities, but it is not the sole motivation of human beings. Property relations do affect the production pattern, as also the distribution of the social product. But man does not live by bread alone. One needs to ponder. There are innumerable instances of not only individuals but whole groups of people, indeed entire nations taking postures, not on the basis of economic considerations but as a result of other motivations. The family, the caste, religion, tribal affinities, many other ties bind groups and their decisions. Indeed, the very concept of nationalism transcends the calculus of the economic man. The liberal philosophy of the 18th century invented the economic man, and the philosophy of historical materialism would make sense only if all humans are suffused with the emotions and motivations of the economic man. But the economic man is only a part of the human personality; the concept does operate up to a limited extent. The vision of the economic (and moral) good of all human beings is as much a part of the human personality as Adam Smith's concept of self-interest guiding all economic activities. These different perceptions arise under different circumstances, but they cannot be brushed aside.

A rational thinking person has therefore to evolve both a philosophic and an economic answer to the fundamental issues concerning life and living. (Admittedly, there are arenas in which our sensory perceptions, our experiences cannot fathom. For example, the human eardrums can only catch a small part of the sound waves that suffuse the atmosphere. What a mercy that is!) But the limits to human perception do not imply saying

THE RESEARCH SCHOOL OF PACIFIC AND ASIAN STUDIES

The Institute of Advanced Studies, The Australian National University
Postdoctoral Fellow/Research Fellow in Australia-South Asia Research Centre,
to work on the policies and process of economic reform and liberalisation in
South Asia, specialising in international trade and investment, and in the
international economic relations of South Asian countries

Appointment Postdoctoral Fellow up to two years initially with possible extension to the maximum of three years, Research Fellow three years initially with possible extension to the maximum of five years, subject to funding
Salary Postdoctoral Fellow \$A 32,914 \$40,087 pa Research Fellow \$A 42,198-\$50,111 pa **Further particulars**, including selection criteria from School Secretary, RSPAS Fax (61-6) 249 4836, e-mail schlscc@rspas.anu.edu.au
This is a re-advertisement of a post advertised earlier in 1995, previous applicants need not re-apply. Applications to the Secretary, The Australian National University, Canberra ACT 0200 quoting reference number PA 6.12.1, including curriculum vitae, list of publications, names and addresses of 3 referees **Closing date:** 31 January 1996

goodbye to 'reason' It is in this context that the Leftist thinkers need to rethink the 'roots' of their philosophy, their economic ideology

But our concern here is not with ideology, our concern is with what may be deemed to be practical, practicable for the developing countries in the complex international framework that exists today While practice must be consistent with theory, in turn theory must be relatable to reality

In a sense if one were to work out the solutions backward the task may not be too difficult Marx envisaged a communist society wherein with the withering away of the state there would emerge a society which cares a society wherein people would find their vocation combine their efforts for production activity distribute the social product as per 'need' and each individual would have enough leisure to pursue other interests (the arts the sciences exploration, the sky being the limit literally)

That may be a distant dream but the idea is consistent with true democracy with a really democratic society And the concept of democratic society is something with which all thinkers are essentially in tune The liberal philosophers of the 19th century including those who advance the cause of individualism – would readily accept the fundamental tenet of a democratic society The concept which is not consistent with this philosophy is that of an 'economic man'

It is reiterated here that the concept of an economic man is a myth Man is a social animal the herd instinct is seen to operate in many walks of life It is the concept of the economic man which is the centre piece of neoclassical economic theory But human beings are not necessarily maximisers of personal economic well being

Economic development it is widely recognised even by neoclassical economists – not has not been even as between different peoples different locales The basic reason is the problem of externalities So, even if all human beings were rational 'maximisers', the problem of externalities would prevent equal (or even approximately comparable) development This is where the state – or some other organ of society – has to play a mediating role Markets alone cannot bring about the 'development' of societies which have been left behind for diverse reasons Indeed in a modern (and complex) world, there can be no concept of a *coined* macro-economic balance in any economy without active state intervention It is no longer necessary to refer to Keynes' refutation of classical theory that mere adherence to signals given by market prices would achieve an optimal equilibrium It is this (essential) requirement of state intervention which repudiates the philosophy of 'minimum government' for such a government would only perpetuate the *status quo ante*, whatever the *status quo*

It is therefore necessary today to repudiate with even greater force and clarity the increasing attack by the right on all welfare and social security expenditures by the state But while that applies to developed capitalist societies – who need to go back to the concept of a welfare state – what is the economic philosophy that would benefit low productivity poverty-ridden societies like India? Where broad-based economic development is the first or the basic requirement?

DEMOCRATISING SOCIETY

If we believe in democracy we must then rethink the political base of our society A genuinely democratic polity is not possible without a democratic society but the latter implies all manner of prerequisites – many of them clearly laid down in the Indian Constitution which sadly are just not part of our present heritage So one needs to ponder what is it that has to come first in this land of some 900 million people with some 40 per cent or so below the poverty line? How do we ensure the raising of these teeming millions in the present international milieu?

A democratic form of governance of the Swiss type or even of the Scandinavian variety is not possible in India today We have inherited the Westminster type of parliamentary democracy, in a highly undemocratic society Ideally, India should have been a federation of states, but in the present international framework that could be suicidal as an immediate solution But can we not attempt to live up to our own Constitution?

Today we need a strong state only because we need state intervention to introduce greater egalitarianism more widespread and equitable development We need a strong state to develop infrastructure and to raise the resources required for this purpose equitably So we need a central authority imbued with these ideals in fact a left-of-centre government with an egalitarian philosophy And, like the Chinese in the 1950s, we need to *mobilise* people our greatest strength namely the existence of a large pool of underemployed manpower, for local area development And yet, this type of mobilisation is not possible centrally Decentralisation of all matters of local interest to local authorities people's representatives at the lowest level with the people exercising constant vigilance – decentralisation of both political and economic authority on all such issues, would ensure both local area development and greater equity

This is essentially what Gandhiji had in mind when he envisaged his panchayat raj in villages, with indirect elections all the way from the villages to the district, from the districts to the state from the states to the centre That would give us as close a semblance to true democracy as one can envisage There would remain many

responsibilities that only the central or the state governments could discharge As indicated earlier, in a complex modern economy, the achievement of macro-economic balance would require intervention by the government at the centre There would arise many other such responsibilities including the build-up of infrastructure arbitrating on common resources or unevenly distributed scarce resource for which costs and benefits both need to be shared Indeed in the complex competitive world today there would arise an imperative need for the state to take up diverse other responsibilities including heavy expenditures on – and direction given to – Research and Development effort and the enhancement of the knowledge and skill base of the people We do not we cannot live in an isolated world of our own We must be able to compete Again competition is possible only among equals So it is essential for the state to intervene so as to improve the capability of the people to enable them to compete successfully with the people of the economically developed countries

It is something of a paradox in India today that the only political party wedded to the concept of democratic centralism has in practice tried to operate a system of democratic decentralisation in the matter of governance and of economic planning It is an even greater paradox that the party nursed by Mahatma Gandhi before independence has in practice concentrated all power at the centre even state level leaders have been reduced to being mere supplicants for the favours of the central leadership But these are peripheral issues not germane to the problems being discussed The basic problem of the political parties which are left of or to the left of the centre is what ideology what strategy would not only help them to power but also help the people of this country to get out of the present syndrome of low productivity low output low savings consequent low investment and low productivity?

Even though in strict theory market socialism is a misnomer in the sense that market theory and socialism do not mix well

it is necessary to accept that both the planner (the central interventionist) and the market have a role to play, the latter if only because we have seen the fatal consequences of too much reliance on the judgment of a few people and because in a globalised world we must face the competition of the market economies The role of the planner is related to the problem of externalities how best to overcome the handicaps and take advantage of the benefits in any situation as also arising from any given set of policies/actions/investments

But state intervention in India should not be confined to the centre what is required is *societal* intervention at the (micro) village and town level for planning the well being

of the teeming millions of this country in the rural areas, there has been much talk of local 'watershed area planning' and obviously such planning can be done by local communities

There would arise many problems, problems of co-ordination, problems of funding. But all problems have solutions provided that we have our objectives set in the common interest, for then, we would immediately get a consensus and willing participation of the people in the common endeavour

MAKING MARKETS WORK

And over a large area of activity, markets do exist, markets function (and where they do not, they should be made to function) and the lowest common denominator of leftist and left of centre ideology should be to accept the functioning of well regulated markets within certain limits. The market system is certain to engender inequalities, but it is the function (and the responsibility) of the fiscal system to tilt the balance towards equity through taxation and through welfare expenditures. In other words, what is feasible

and therefore the obvious objective - is Scandinavian style social democracy. This is heresy for a Marxist, but it is essential if we are believers in the dialectical process to take a look at world developments, the scenario in India, and mobilise the people for a practical, practicable programme for their development.

In any case, we need to remind ourselves that with some 85 million peasants in India, we have a system of production which is anything but socialistic. Peasant farming is not necessarily capitalist farming either, and that is one area where, in our drive for increasing the productivity of land, we must pursue two contradictory policies: first, redistribution of land to the actual tiller of the soil, there being 110 million landless labourers working on farms owned by others - and secondly, we must also encourage all farmers to maximise, through horticulture, development through dairy farming (using small tracts of land for raising fodder and mixed crops in addition to some food) through the provision of the required non-land inputs (irrigation, seeds, organic manure, extension services) including finance, the provision of widespread extension services through the panchayats. And it is through an agrarian revolution of this kind that we can hope to prepare the country for widespread industrialisation. Demand would generate the supply (exactly the obverse of Say's Law), which is the way that China achieved the extraordinary progress that we witness today.

This is not exactly a tidy philosophy, but more in the nature of an action plan. But the philosophic underpinning has to be the objectives of greater equity, faster development with social justice, for which genuine decentralisation would be a means. It would also be the means for progressing

towards a truly democratic society, which is essentially what both Karl Marx and Gandhiji envisaged through entirely different paths.

While theoreticians may work out the ideological underpinning, we need a consensus on a 'minimum programme' on the above lines, among all progressive people in India.

NEW AGE INTERNATIONAL PUBLISHERS

NEW

Urban India in Crisis

Edited by

Kulwant Singh and Florian Steinberg

This important volume evaluates the present urban development scenario in India, and takes stock of recent policies, programmes and initiatives in the urban sector.

The eminent contributors to this book unanimously point at the need to strengthen the urban agenda, and to undertake concerted effort towards the implementation of such an agenda in order to stabilise and balance the urban development process.

This book will be of immense interest to economists, environmentalists, architects and town planners.

Evolving a Women's Agenda

Report from Beijing

Indu Agnihotri

While at Nairobi an attempt was made to deflect attention from a systemic perspective of issues, focusing instead on particular manifestations of women's oppression, in Beijing the initiative rested with the international women's movement. The significance of the conference lay in its movement towards a building of alliances on issues which were outside what is termed 'women's issues'

In the history of world conferences on women the Beijing meet stands out for its reassertion that women's struggles are integral to the mounting challenge to the existing world order and that women's issues could not be segregated from larger issues related to development. It is also clear that women's struggles in various countries are not disaggregated and dissipated. Beijing and Huairou reaffirmed the vitality of the movement. At the same time the perspective of groups which advocated even issue-based initiatives made the connections with the global reality clear. While the UN document assumed this reality to be a given, there were serious contestations of this 'given' order from women in the developing countries. In this way participants challenged the feasibility of the draft document directives in addressing fundamental problems given its explicit endorsement of the current process of globalisation at the behest of the World Bank/IMF. This was tantamount to a challenge to the developmental model being pushed by the G-7 nations. The official conference was also witness to an attempt at the consolidation of the G-77 grouping. This was compelled by the shift of political forces from the last world meet in 1985 in Nairobi where the emphasis was clearly apolitical, a reflection of the complacency of the NAM alignment and the confidence of the first world. With the collapse of the socialist bloc it became clear that the struggle for women's rights was up against political forces which were pushing the agenda in favour of fundamentalism and tearing out of context the very goals sought to be achieved. At Nairobi a clear attempt was made to deflect attention from a systemic perspective of issues focusing instead in a fragmented and ineffectual way on particular manifestations of women's oppression. Gender sensitisation and training was being bandied as a panacea while it became clear that the movement itself did not set the agenda. In Beijing, the initiative rested clearly with the movement. The failure of the developed countries to cope with the crises in world capitalism was brought out by pointed critiques of the gamut of liberalisation strategies and trade agreements from within the developed world itself, drawing attention

to the effects of the 'dismantling' of the welfare state. This provided the backdrop to a consolidated critique from the perspective of the international women's movement. It showed the relevance of the international political context in the framing of any meaningful women's agenda, rather than it being based merely on biologically based sisterhood. This is not to understate the domination of the advanced west in the international political configuration which was apparent right from the preparatory stage of the conference and in the selective nature of accreditation given to NGOs. Here the influence of the donor agencies was clear. The first world dominated in terms of the presence of their governments and in the say that the first world based donor agencies had in deciding who went to Beijing. The gap between the aspirations articulated by the movement and the commitments governments were willing to make remained nevertheless.

The significance of the conference lay in moving towards a building of alliances which spilled out of strictly 'women's issues', reflective of a shift in the prevailing attitude towards the direction of global change. This was completely missed out in media coverage of the event. The dominant media representation seemed to endorse the trivialisation of women's issues which were also restrictedly seen as relegated to the right to abortion, fight against rape, sexual abuse and so on. Further these were projected as being delinked from international issues.

This delinking was surprisingly abandoned when it came to China-bashing, the other dominant trend in media coverage of the meet. The grounds on which China was picked out as an 'inappropriate venue' (its capabilities in hosting the meet, its record of human rights violations, female infanticide, forced abortion, Tibet and state censorship) reflected the hostility towards China. What was more surprising was the uncritical acceptance of this bias by the media of the third world, which even though not always shared by the journalists present, was carried over through western news agency copies carried by the newspapers. To those who were present in Beijing-Huairou it was

clear that China was more than capable of hosting the meet: the arrangements made in terms of accommodation and transport facilities were excellent. It needs to be pointed out that these arrangements were made even for those on a tight budget—a fact glossed over by the strident critics of the venue. As far as apprehensions about surveillance and security go, it was clear that it was largely restricted to procedural requirements of such a large meet and did not infringe on delegates' freedom of movement or speech. Pamphlets of all kinds were freely distributed and demonstrations were held at the Forum site every day. Finally, the belief that violence and crimes against women are a third world problem was belied by the various personal testimonies by women from developed countries of the first world in the public hearings on women's rights as human rights in Beijing itself. Amongst others there was a testimony given by a lesbian from the US which is indicative of the state's record. She was put in a mental asylum between the ages of fourteen and eighteen on grounds of "gender identity disorder" at the cost of a million dollars. The first world's role in the commodification of women through promotion of sex tourism and trafficking of women was highlighted in a number of workshops. That the state reflected patriarchal norms in dealing with women was highlighted by a speaker from Ireland where both divorce and abortion are frowned upon. Along with others, the US has yet to ratify the Convention on Elimination of Discrimination against Women (CEDAW). The violence that multinational companies generate in Mexico across the US border in the lives of the *Makiladoras* was very revealing. To single out China for a pointed attack was clearly a motivated political strategy. This however, is not to imply that China or other social countries should be glossed over when assessments are made of denial of women's rights/human rights.

IMPLICATIONS OF SAPs

The critique of the current stage of capitalist development was mounted from different standpoints throughout the Forum. There was near unanimity over the havoc wrecked on women's lives by SAPs and globalisation strategies by lowering their status and dismantling of social structures created for their support leaving them at the mercy of market forces. There were over 300 workshops dealing with economic issues which indicated the effects of international trade agreements on national policies and the role of international funding agencies. The baselessness of the claim that peace, equality and development could take place in the prevailing ethos of the global economy was questioned by delegates from Denmark, Canada, the Scandinavian countries, Ireland, Latin American, Asian and African countries, especially given the complicity of the north in the development of the arms industry. And

the interference in the democratic processes of the south by such monies e.g. the UK's funding of the Mozambique elections. Across the board women emphasised that women are not a unitary category that the indignities heaped on them had their roots in economic and political structures that these were not neutral *per se*, and that material realities had a crucial bearing on their lives.

Feminisation of poverty figured as a major theme. The International Association of Feminist Economists organised a series of panel discussions which put women's property rights, control over land and resources and challenges posed by globalisation on the agenda. Strategies and struggles against SAP were also focused on. The implications of new laws regarding intellectual property and the threat to the environmental balance was specifically discussed in many sessions, also with specific reference to the hazards of the consumption and production patterns of the developed countries.

In a workshop organised by the Women's International Democratic Federation (WIDF) the dominant ideology leaned to the left. It was pointed out that 60 per cent of the world's rural population were women and two thirds of the poor are women and that half a million women die every year due to maternity related problems. A delegate from Cuba noted the effect of the economic blockade on Cuba which is tantamount to the denial of Cuba's sovereignty as a nation. A representative of the All China Women's Federation affirmed that in China too the brunt of the new 'open' policies was faced by women. A delegate from erstwhile East Germany spoke of the problems faced by her people after the reunification in terms of education, housing and other social and welfare issues.

A consolidated opposition to religious fundamentalism was clearly sought to be built in the Forum. This was heartening in the wake of the organisation of the Christian and Islamic fundamentalist groups for the meet. There was a formidable presence of large numbers of female supporters of these orders. They attacked women activists as being godless, non-feminine, anti-family, unnatural and attempted to portray Virgin Mary as a feminist and a religious symbol. Discussions on violence, law and reproductive rights would inevitably veer towards the issues of fundamentalism along with economic globalisation. Considerable attention was focused on issues like abortion and inheritance rights of women under different personal laws, especially women under Islamic laws. There was a formidable opposition sought to be mounted to the fundamentalists and women from countries, including those with theocratic governments, were outspoken in viewing religious fundamentalism as the greatest challenge to the women's movement.

It was also clear that to enlodge the concept of women and agent in a de-contextualised and de-politicised sense was dangerous. Hereby, beliefs and practices of an exclusivist gente are sought to be sanctified on the basis of 'differences' and women are projected as

being active participants in the perpetuation of such ideologies. In fact the presence of such a large number of women upholding religious fundamentalism in an international conference on women points to the insidious manner in which the feminist facade of fundamentalism operates. Unable to present an outrightly anti-woman face fundamentalism has tried to adapt itself to many modern agendas and even cites 'cultural difference' as the basis for deflecting criticisms. This is something that a liberalist agenda cannot theoretically counter. Doubtless cultural difference does exist and need to be given their due. However it does not necessarily follow that cultural frameworks become the paradigm within which these issues are to be confined. The most significant question lies in analysing the precise basis of gender inequality which is systemic. Culturally relativist stances lead to selective tinkering with some aspects of women's existence without undermining (sometimes they even strengthen) the systemic basis of this existence. The fundamentalist agenda would at best be confined to cosmetic mitigation of women's conditions that too along the lines of prescribed norms. Countering the woman fundamentalist remains a challenge before the women's movement.

VIOLENCE AGAINST WOMEN

Judging by the importance given to discussions on violence against women it was clear that despite the number of action programmes focusing on different aspects of violence, the issue continues to remain an important one for the women's movement. If anything there seems to be an intensification of mental and physical violence against women in the recent past. A plenary session organised at Huarou consisting of public hearings of personal testimonies before a panel of judges revealed the gross violation of women's rights at all levels. It underscored the fundamental point that women's rights were human rights and that the inability of the state to safeguard the rights of its citizens was a violation of the state's commitments and responsibilities towards them.

These hearings were the culmination of efforts begun in Vienna 1992. Radhika Coomaraswamy, UN's special Rapporteur on Women placed the preliminary findings of a report on domestic violence. The proceedings highlighted in general the different aspects of violence: domestic, child abuse, rape in situations – of war and strife, dalit women's oppression in India, violence arising out of power situations at the work place, due to class and social structures, violence emanating from moral precepts against lesbianism, the sufferings of the Korean comfort women' and so on. The state whether liberal democratic or authoritarian was equally implicated in the denial of civil rights and justice to women. More than anything else, the session made clear that all societies were witness to problems on this count and not just societies from the peripheral regions of the world.

The women's movement has, since the outset, engaged with the law as both reflecting dominant attitudes as well as instrument of

effecting change. Within the movement though standpoints and strategies differ, a tradition of legal activism exists which emphasises that law cannot be treated either as a given nor as static, even as specific sections and clauses are invoked for implementation. There were workshops on the rights of women under different laws, more particularly personal laws. Judicial bias also came in for criticism. There were also discussions on the strategies to expand the horizons of laws and legal concepts in a workshop on 'Basic Laws – Basic Needs'. One argument advanced by a participant from the Caribbean region was that talk of legal rights is rendered meaningless unless enabling conditions are created for the actual exercise of these laws. Equality cannot be secured merely by provision of legal guarantees. In the discussion on CEDAW attention was drawn to the fact that no follow up legislation had been brought forward to advance the implementation of the concerned clauses after the signing of the convention by several nations. Furthermore in many countries countervailing laws continued to exist alongside the CEDAW and in some cases new laws had been passed which were violative of CEDAW in letter and spirit. The AIDWA delegate cited the example of the Muslim Women (Protection of Rights of Divorce) Bill 1986 which continues to be in force despite being challenged in court and, by all accounts, being violative of both CEDAW and fundamental rights enshrined in the Indian Constitution. Participants pointed out that the convention lacked teeth and could not be implemented. Also that the reporting procedure was extremely lacking. Countries like India could get away by merely ratifying the convention and subsequently violating it. In a workshop on women's rights in Nepal the manner in which majority fundamentalism was practised was discussed. Nepali women suffer under brahmanical Hindu laws of Manu e.g. in Nepal bigamy is valid, the second marriage is not void. The maximum penalty imposed, if at all, is that the bigamist goes to jail for a few months.

The context to the discussions on reproductive rights was the Cairo Conference in 1994. At Beijing fundamentalists, Islamic and Christian, were well organised. Activist groups from the south were also well prepared to challenge the Cairo draft which seemed to push population control measures through social policies which made contraceptives proven to be hazardous part of an aid package. This reflected the paranoia of the first world of being engulfed by a population bomb. So battle lines were drawn on two fronts: one favouring reproductive rights along with availability of long-acting barrier method contraceptives as part of a more comprehensive health policy, the other focusing on the autonomy argument, based on freedom of choice against the repressive social policies based on fundamentalist precepts represented by the Vatican and Islamic fundamentalism, led by Iran.

Sexuality as an issue, only beginning to surface in the women's movement in India, was high on the agenda of a sizeable section

in Beijing. Despite reservations about the single point nature of the sexual rights agenda, often at the neglect of other related problems, there was recognition of the sexual rights issue as a part of human rights. Indian laws, though regressive in many aspects, remain silent on the issue of lesbianism though discrimination and fear of discrimination prevail.

In a number of workshops participants from the Philippines, Nepal and Thailand pointed to the manner in which women from their countries were at the receiving end of sex tourism. While prostitution is an age old phenomenon, sex tourism seems to have grown in the recent past. This was obvious also from the fact that more western men frequented sex workers than Thais in Thailand.

The question of rights of prostitutes was raised very forcefully. Speakers from the International Collective of Prostitutes argued that their work constituted an occupation and therefore they ought to be given rights as workers. Some conceded that this work was abusive to women, and that the institution as a whole was abusive to women. A peculiar argument was put forward drawing an analogy between marriage and prostitution to argue that women face a lot of abuse within their marriages but the institution of marriage is not condemned and women are not told not to get married so why should sex workers who are abused in their profession be told not to engage in such work? This was countered by those who maintained that the two institutions could not be counterposed, even though abuse of women within both institutions poses social problems, the two can neither be collapsed nor encapsulated in a single legal gesture. Speakers pointed out that prostitution was on the increase in countries where social securities were being withdrawn and new opportunities were not being opened up. In the developing countries women were forced into prostitution as a survival strategy for their families in the face of ever increasing unemployment and poverty. Also the problem with respect to children as sex workers was raised and here the argument for rights of sex workers as women's rights and based on choice just could not hold was made clear. There was some ambivalence with respect to the relationship between the demand for rights of sex workers and women's rights. Some reservation was expressed over the connection on grounds that prostitution as an institution was perpetuating oppression on women, so recognition of sex work 'like any other work' would violate the fundamental principles of women's struggles which is against prostitution *in toto*. Nonetheless reasons for prostitution were recognised: poverty, unemployment, racism. Another consensus that emerged was that there should be de-criminalisation of society in general so that women are in a better position to counter the abuses by police, pimps and clients. There was a strong general opinion against trafficking. A Chinese delegate said that prostitution was increasing in the new economic zones with the increase in difference between the rich and the poor.

PLENARY ON INTERGENERATIONAL DIALOGUE

This session was intended to be a dialogue between the doyens of the women's movement and some of its younger proponents. Helvi Sipilä spoke amongst others. Gloria Steinem who was unable to attend, sent a message which made three main points: (1) Feminism is not about telling women what to do but to enable them to make choices and decisions, (2) The older generation should lead by example, (3) For older women there was great joy working with younger women since this awakened the child in the older women, a sentiment which is killed through years of suffering and violence.

A young teenaged delegate from Australia noted that it was important for the older generation to be more sensitive to the needs and problems of younger women, and to allow them a greater role in decision making in organisations. Sipilä, one of the 32 women present in the UN Geneva meeting which gave the call for 1975 to be observed as Woman's Year said that 'we talk about power to decide to intervene. We have to make women system makers, and not only victims of war or other events'. Another delegate said that this is the right time for political action, to move from demands to proposals and from demands to action. Women have effected far reaching changes without shedding any blood - they have done it peacefully which is a remarkable achievement.

Participation in political processes and a greater involvement of women in decision making featured through a series of workshops on democracy, grass roots initiatives, governance and policy. Whereas for some it was the question of solving the problem of lack of women in decision making by ensuring the greater physical presence of women in decision making bodies, for others it was linked to the advance of democratic forces and interventions which were both pro women and pro development. It was clear that women's participation was low under military regimes and that the context of democracy and a commitment to development underlay any meaningful demand for women's role in decision-making. Beginning with the message from Suu Kyi and the experience of the Burmese people under successive military regimes, to protests for a nuclear free Pacific and the pointed display of anger at US policies while Hilary Clinton spoke at a plenary, a large majority of activists gathered at Beijing emphasised that this struggle was against oppressive structures which had their roots in macro-policies and larger structures: nations, classes, communities and to the balance of power prevailing between them. The fact that women's participation and representation in political fora was not reflective of their contribution to society was a reality cutting across the north-south divide. Their participation in political bodies continued to be dismal at all levels in all countries except the Scandinavian. In fact, as the UN claimed, it was itself far ahead of member states in putting more women at the top. Women's participation in institutions of local self-governance was much higher though, especially in the socialist states.

Running through the conference was the emphasis on the need for greater participation in the political process in institutions of governance at all levels and the need to get more women into decision-making bodies. This was a clear advance on the earlier slogan of the personal is political or the focus on body politics. Developments over the past two decades had made it amply clear that while one could attempt to liberate oneself from the shackles of oppressive patriarchal ideology at the level of interpersonal relationships, the structures of oppression remained intact. While the critique of these came from a predominant section of women from the developed world only on account of their being anti women, the critique mounted from the third world countries directly linked it to the process of democratisation. Thus women from the developing world felt the need to associate with political bodies so as to not just get policies that were pro women but to influence decisions so as to push for policies that were more amenable to development and women in particular.

This year's *Human Development Report*, released at a special session at Huairou, emphasised the central message that human development must be 'gendered'. Speaking on the occasion the UN representative argued that if development is meant to widen opportunities for all people then not only is there no rationale for the continuous exclusion of women, but also that this denial of opportunity warps the processes at the outset. The report itself asserts that history is likely to judge the progress in this century by one major yardstick: is there a growing equality of opportunity between people and among nations? Advance in this direction cannot be a technocratic goal but has to be recognised as a political struggle. The criterion used in arriving at an all inclusive gender development index in the report is open to discussion.

WOMEN'S STUDIES

At Beijing the tremendous information boom accompanying feeding into and drawing upon the women's movement was very visible. This was extraordinarily well brought out by the display and sales counters set up by Women's Ink, Feminist Book Store, The Institute of Development Studies and so on. While most of the publications came from countries/publishing houses based in the north, the south was by no means unrepresented. Activists' reports and pamphlets combined perspectives emerging from women's studies with those from the movement. Interestingly divergence in perspective or stated/unstated tensions between activists/researchers were not as visible as they sometimes are in our own women's studies conferences in India although in each workshop one could see a healthy mix of activists and academics who together contributed to the standpoints that emerged.

Why should this be the case? There are two likely explanations: one in such a large

conference, pre-selection would minimise tension given the simultaneity of workshops. Secondly, women's studies' scholars from centres or fora as diverse as the International Association of Feminist Economists, Croatia, Latin America, Canada spelt out the contexts in which they were (a) conducting women's studies, (b) framing the parameters of their analysis. The combination of activism and research was evident in these studies, as also in workshops related to themes such as 'Valuing Women's Work' (which included sales of baby suits with the slogan 'I am a fulltime job!') or 'On International Coalition against Debt', 'For the Comfort Women in Korea', 'Against the Nuclear Arms Race'.

The Feminist Press, CUNY, and the Centre for Research on Women along with WSIS organised a series of panel discussions which tried to put across a comprehensive picture of women's studies across the world. The sessions took stock of both structural and analytical inputs in the field. While global trends in women's studies did not emerge with any sharp delineations, the sessions gave a fairly comprehensive picture of the state of women's studies through the 1970s-90s, as well as the problems faced in including gender into the educational curricula.

The focus of discussions on 'Women's Studies and Public Policy' can be summed up in the title of a book on display at the Feminist Press bookstore: *How School Shortchange Girls*. General discussions were held on the quality of education, the lack of infrastructures, as well as questions of who comes to school and who stays on. A panelist from Canada raised the question of political agendas being tied up with education. With the visible shift to the right in politics and greater privatisation a two-tiered structure of education was emerging: one for those who could pay and one for those who could not. Along with the increase in racism in the west, growth of cynicism accompanying privatisation was also discernible. It was clear that the women's movement itself had given a push to women's studies by drawing attention to: (a) women and education, (b) analysis and review of curricula from a gender perspective, (c) institutional review of the gender bias in academic institutions, (d) analysis of classical studies to make gender more visible. An entire series was organised on a range of issues by the City University of New York. Some of the themes on which panelists presented papers were: 'Engendering Institutional Change', 'Research Theory and Activism', 'Post-Colonial Women's Studies', 'Teaching about Mothers and Daughters', 'Women's Studies and Public Educational Policy', 'National Report on Women's Studies Centres/Programmes' begun in the 1970s till the 90s, and towards a worldwide federation of women's studies scholars.

At a plenary organised in Huairou the role played by UN agencies in advancing the cause of women's empowerment and gender equity strategies came up for discussion. Representatives of various UN organisations such as the UNFPA, UNIFEM, UNICEF, and UNDP reported on the manner in which women had emerged as a target group in

agency programmes/projects. The status of women within the agencies was commented on and observations made on the success of training programmes to focus on gender issues. However the panelists resisted being drawn into discussions regarding the positions being advanced in UN documents and the extent to which these advanced the fight for gender equality. When attention was drawn to the fact that the UN could perhaps be lending itself to what was seen as 'retreats' and that the history of the UN was now being talked of only as of Rio, Cairo and Copenhagen whereas important documents such as the Alma Ata one were being consigned to the archives as pre-history, this was seen as 'negative assessment'. For the record it must be mentioned that the UN programme had put pressure on some governments to specially focus on women. As a prominent functionary in the UN rightly asserted, "in the UN when equality is achieved it will be not only for women but for the organisation as a whole".

The functioning of NGOs and their relationship with donor agencies came up in discussions. Many took positions which were critical of donors and funding agencies. Questions were also raised about the role of donor agencies and the attempts to influence agendas and NGOs which were accepting funds. This aspect becomes particularly crucial in the light of the preparatory process of the UN conference where donor agencies were very influential. Countries need to make financial commitments about their own Gross Domestic Products (GDP). But budgets and the decision as to who got to the conference and who could speak was also a question of money. At least half of the delegates to the NGO Forum were US- and Canada-based. Japan, China and Thailand too had a large presence. The extended preparatory process has to be critically reviewed. Many activists could not make it to the conference. There is a pattern to the networks that have been built up. For the first time the Indian government was forced to have a mediated relationship with its own NGOs through an Inter-Agency Facilitating and Co-ordinating Bureau, which itself is a creation of the donor agencies. This pattern was repeated in Beijing. Briefings and meets at the official UN conference could only be organised through such established networks. Furthermore, the NGOs and NGO caucuses are based in the first world: their heads, and spokespersons are largely from there though a token presence of the others may be seen. These are not always allowed to voice their opinions.

Given the hostile press the Beijing meet received it is necessary to put on record that the organisation of the conference was really admirable. Having heard about long queues at Cairo, etc, delegates were prepared for the worst. In fact the entire conference was extremely well organised. Not only were basic needs met in terms of accommodation, even TV, telephone, ISD, Fax, banking facilities and transport were easily available. The same goes for medical facilities, though a friend who required dental care found that she had to pay far more for the ambulance to be taken

to the hospital than for the dentist's fee. Food was available generally at about five minutes walk from different conference venues. The Golden Arch of McDonalds could be seen at a few spots and even as Judy Small sang a song about the onward march of American junk food (amongst other things), there was a demonstration outside McDonalds one afternoon. Food was, however, slightly expensive going by Indian food budgets. On an average some of the delegates managed to live for 15 days on about \$ 300-350 which is fairly reasonable going by the amount one pays in the west. Translation facilities were available in all the plenaries, and for some of the larger workshops.

The dismantling of the socialist bloc was evident in the waning of the peace movement. The Peace Train group from Helsinki had problems co-ordinating itself leave alone link up with the others. The presence of Japan was marked in the peace initiatives. The Peace Tent was the centre of many activities.

The WIDF-organised workshops on the post-socialist scenario which included some interesting discussions on women's rights in the eastern bloc countries. A awareness on the post-soviet unipolar reality was strong among the Palestinians. Many of these delegates were using this conference to regroup and take stock of the specific challenges faced by them. As one Croatian put it, in a discussion on women's studies there is far greater talk of women's rights now since the earlier climate of the 'ideology of equality' no longer exists.

It is important to note that while critiques of capitalism and opposition to imperialism were forthcoming from varied quarters there were no alternative 'models' being advocated. It was as if activists had realised that for the moment coming to terms with this phase of globalisation was the issue at hand and that the economic agenda of conservatism was not entirely divorced from the aggressive political stance being adopted by fundamentalism. Recognition of this double-edged sword was a first step towards stemming the tide of conservatism and asserting that the women's movement was a significant component of the forces working towards structural transformation.

Notes

[This report is based on impressions of the meet as part of the All India Democratic Women's Association delegation to the Forum and does not claim to be an exhaustive account of the entire meet. I would like to acknowledge the inputs received from the other members of the delegation and through discussions with Vina Mazumdar. Bela Malik kept up a healthy pressure on me to write the report.]

1 While there was a consensus on the failure of the existing policies to deliver, there was no unanimity on the alternatives, not even from the standpoints from which the criticisms were being made. Even so, the meet was characterised by a remarkable openness in attitudes, cutting across regional and ideological lines (barring the fundamentalists). This was reflective of the overall need to obtain a broad picture which was necessary in working out counter-strategies.

Social Clause: Is Its Opposition Justified?

Sharit K Bhowmik

While the combined opposition of the developing countries to the linking of the social clause with international trade has had the effect of deferring its imposition, it is a matter of concern that these governments have done little to implement the ILO conventions safeguarding the rights of labour

INDIA happens to be one of the few countries where there is near unanimity between the government, the employers and the trade unions on opposition to linking the social clause with international trade. Indeed most developing countries fear that whatever competitive edge they have in the world market through lower input costs will be offset by the imposition of the social clause. By unfairly highlighting the provisions in the social clause the developed countries can create trade obstacles through issues like human rights and unfair labour practices.

There is a lurking fear among the developing countries that in the present unipolar world these measures will be used by the developed countries especially the US to intervene in the internal affairs of the developing countries thus eroding their political sovereignty.

These fears are without doubt well-founded. The US especially has linked trade with developing countries with human rights in a selective manner. For example, the US is spearheading the economic blockade of Cuba in the name of human rights even though there is no concrete evidence of any major violation. At the same time China is given the status of Most Favoured Nation despite the fact that it has unabashedly curbed democratic opposition. Such examples of double standards are very common which makes one doubt the genuineness of the concerns voiced by many of the developed countries about the sad plight of labour in the developing countries. Are these countries taking up the issue of the social clause because they sincerely believe that this would enable a better deal to labour in the developing world or are they using it as a ploy for their own interests by raising non-tariff barriers to international trade and in the process causing greater harm to labour in these countries?

Reactions of developing countries towards the imposition of the social clause have been quite strong. They have unanimously rejected its linkage with international trade. The fifth conference of labour ministers of non-aligned and other developing countries held in Delhi on January 18-23 rejected what it termed as

the 'west sponsored move seeking to link international trade and labour enforcement standards. The conference, which was attended by labour ministers of 57 countries, decided to oppose at all international fora any attempt to link ILO conventions with international trade. Speaking at the valedictory function of the conference India's commerce minister Pranab Mukherjee said that the social clause was a means of depriving developing countries of all the opportunities provided to them by globalisation and free trade following the GATT agreement. This united opposition of developing countries has had some effect on the World Trade Organisation (WTO). It has temporarily decided to delink the social clause from international trade.

An immediate fall out of the aggressive attitude of the developed countries in this matter is that the developing countries are becoming increasingly wary of any attempt by international bodies to grant protection to labour. This could be clearly seen in their attitudes towards a proposed convention on home-based workers by the ILO recently. While the international trade union movement was unanimous in supporting the move for a convention most of the governments having large sections of home based workers thought otherwise. Some such as India and China favoured a recommendation rather than a convention while most others opposed both. Interestingly countries like the US and the UK which have been at the forefront on the issue of the social clause opposed both convention and recommendation on home based work. Perhaps they were worried that this protection would result in higher wages to the large section of informal sector workers (comprising mainly immigrants who work in sweat-shops) in these countries. Here too we can see double standards at work.

ISSUES RAISED BY SOCIAL CLAUSE

The developing countries have for the present been able to defer the adverse effects of the social clause on international trade. Nonetheless it is necessary to take an objective look at the basic issues raised by the controversy, namely, the sad plight of labour in the developing countries and to view the

social clause from this aspect, rather than as a tool of the developed countries to suppress the developing world (which it has unfortunately become due to its linkage with trade).

The six ILO conventions comprising the social clause have been passed at various times and some of them have been in existence for at least two decades. Governments in most of the developing countries have endorsed these conventions. Yet most of the provisions are yet not fully implemented in these countries. These conventions are Freedom of association (convention no 87) right to organise and bargain collectively (convention no 98) minimum age for employment of children (convention no 138), freedom from discrimination in employment (convention no 111) equal pay for men and women (convention no 100) and freedom from forced labour (convention nos 28 and 105).

Many developing countries, including India, have passed laws on the issues concerning the social clause but these made no significant difference to the actual conditions of work. The Equal Remuneration Act was passed by the government in 1976 and the Child Labour Act was modified in 1985. Yet women in the unorganised sector still get wages lower than those of men and children below 15 are widely employed in all types of hazardous work. Similarly the right to freedom of association has been granted since long but the overwhelming majority of India's workers especially those in the unorganised sector are yet to know what are trade unions. The Constitution of India abolishes all forms of discrimination based on caste, religion and race but we find that in public sector undertakings the job quotas for scheduled castes and scheduled tribes are never filled up. Is it so difficult to find workers or class IV employees belonging to these categories or is it because the largely upper caste officers who dominate these services refuse to do so?

These are some of the issues which should have been discussed earlier by the government and the trade unions. Unfortunately they crop up only when there is a threat to international trade. Hence it is ironic that while some countries in the developed world attempt to use the social clause to better their own position in world trade developing countries are counteracting these manoeuvres by opposing any attempt to protect their workers. They now tend to view any move to improve conditions of workers as external threats. How else can one explain the government's opposition to the ILO convention on home-based workers?

Had the conventions embodied in the social clause been sincerely implemented by the government the position of labour in India may not have been as helpless as it is now. In this respect the support of trade unions,

along with the employers and the government, in opposing the social clause seems somewhat incongruous with the objectives of trade unionism. The trade unions have opposed the social clause in order to uphold the national interest. However, had the provisions of the social clause been implemented the quality of life of the workers would have improved and this too would have served the national interest.

The major trade unions in India have largely ignored the problems of workers in the unorganised sector. This sector employs 92 per cent of the workers in India and it is also the major employer of women and children. The problems of these workers have largely remained invisible to the policy makers. Hence it is not at all surprising that the sad plight of child labour in the country became an issue only after international exposure. The pressure for eliminating child labour was built up only after it became an international issue. As a result the labour ministers of the developing countries who met in Delhi gave sufficient importance to the elimination of child labour. The government of India too has announced an ambitious scheme for the elimination of child labour. The question now is were not the government and the trade unions aware of the gross exploitation of children earlier? If yes, then why was it necessary for international pressure to mount before any substantive step could be taken towards its elimination? Why have the national trade unions not given enough importance to the question of child labour in the past? The high incidence of child labour is not merely a reflection of poverty in the countryside. It also implies that hundreds and thousands of children have been denied elementary education which in turn will affect the quality of the population in the future.

SOCIAL CLAUSE AND UNORGANISED SECTOR

Perhaps one of the reasons for the indifference towards implementing the provisions of the social clause was that they were relevant to the unorganised sector which has remained largely outside the interest of the national trade unions. The organised sector has implemented the provisions to a large extent. Here too the exception is the tea plantation industry which, with nearly one million permanent workers, happens to be the largest employer in the organised manufacturing sector. In the tea plantations of West Bengal and Assam which collectively employ around 750,000 permanent workers, wages are abnormally low and child labour is officially permitted through the Plantation Labour Act. The figures provided by the Tea Board indicate that these two states employ around 60,000 children (those in the age group 12-15 years) as permanent workers.

Though there is a high degree of unionisation among tea workers these basic issues have never been on the agenda of any of the national trade unions (including the more radical ones like AITUC and CITU).

It is mainly in the unorganised sector that there have been violations of the ILO conventions. Because of the absence of trade unions in this sector the meagre legal protection provided by government is hardly ever enforced. The workers are not organised in order to ensure that the legislations can be enforced. Their protection is left to the good offices of the bureaucrats in the government (the officials in the labour department).

At the same time it can be seen that wherever agricultural workers or workers in the informal sector have been unionised they have been able to improve their living conditions. Trade unions like the Self-Employed Women's Association (SEWA), National Federation of Construction Labour, National Forum of Fishworkers and some of the unions of agricultural workers have been fairly successful in making some gains for the workers in this sector. These attempts are limited and are restricted to the areas of operation of these unions. They are also disparate and they seek to make sectional gains for the specific workers. These unions are unable to focus on the problems of the myriad occupations comprising the unorganised/informal sector. The national trade unions on the other hand are able to take up the problems of workers in the organised sector at the national level and thus force government to pass legislations in their favour. The recent move of the major unions in the unorganised sector to come together to form a national federation, National Centre for Labour (NCL), is a

promising development. The NCL has been formed precisely because the unorganised sector workers have no forum to raise their issues at the national level. This move will hopefully gain visibility to this large section of underpaid unprotected workers. However, this move also exposes the failure or, more likely, the indifference of the national trade unions in taking up issues confronting the majority of the working class in India. One can therefore hope that with a national level union of unorganised workers the issue of implementing the social clause with sincerity will be brought to the forefront. The point to be stressed here is that organisations of the working class (viz. trade unions) alone can be effective in solving workers' problems. Neither the bureaucracy nor any other organisation can fill in this need.

The manner in which the developed countries (especially the US) have been using (or misusing) the social clause cannot be supported by any self-respecting people. The way in which some of these countries have utilised this issue will lead to worsening of conditions of labour in developing countries rather than improving them. At the same time while opposing these moves should we oppose the social clause itself for reasons of national interest? Moreover, why should the working class alone make sacrifices for the nation? Reduction in costs can be achieved by lowering the profit rates of industrialists and not merely by cutting down wage rates but how come nobody sets this on the agenda? While on the question of national interest it should be borne in mind that any move to improve the living and working conditions of the vast majority of unprotected labour should serve the national interest as these people too are a part of our country.

Women's Action Research and Legal Action for Women (Public Interest Advocacy Trust) requires a Programme Coordinator having a law degree preferably with feminist legal theory and women's studies. Practical experience of field work, research and publication. Capable of conducting seminars and legal literacy workshops. Capable of drawing fund proposals and maintaining accounts.

WARLAW – Programme Coordinator (Legal Editor) for publishing a journal on gender cases having a law degree preferably with feminist legal theory and women's studies with practical experience of field work, research and publication.

Salary depending on experience and qualification. Please apply to Chairperson, **WARLAW**, 9-10 Bahadurshah Zafar Marg, New Delhi 110 002.

Will Mariamma's Grandson Catch Up with Maramma's Grandson?

Arunoday Guha

Bereft of constitutional safeguards, dalit Christians continue to stagnate at the lower rungs of the socio-economic hierarchy

MARIAMMA was visiting Maramma. They were born to the same parents and her given name was Narassamma. In Maramma's hut in the harijan cheri of Chundur in Guntur district of Andhra Pradesh, they reminisced about the different paths their lives had taken since that fateful day 40 years ago. That was the day when Narassamma and her beloved Jimmanna had been married in a church under new names, Mariamma and Joseph. The padri had told them that Christianity was a brotherhood and as Christians they would be able to pull out of the madigas' cheri. It appeared true at least on Sundays. For the obligatory one hour they could share the rituals of the service at the church with the entire Christian community of the Chundur environs, even though the few upper caste reddy and kamma Christians had their separate places in the church.

But they returned to the cheri after the service and for the rest of the day and indeed for all the ensuing six days, they remained cut off from the Christians' milieu. Just like Maramma's family was shunned by brahmins, reddy and kmmas, Mariamma's family was ostracised by brahmin Christians, reddy Christians and Christian kmmas.

As the years rolled by, a chasm opened up between Mariamma's harijan Christians and Maramma's madigas. True, they continued to live in the same cheri, visited each other and dined together. But visits were becoming increasingly embarrassing for Mariamma. Maramma's husband Pothayya, with his 40 per cent SSLC marks, had first got a small job in the taluk office and later got elected to the state assembly. Maramma often went to Hyderabad when the assembly was in session and lived in the MLA's hostel and hobnobbed with the wives of upper caste MLAs. Pothayya had his sights already on a seat in the Lok Sabha and Maramma looked forward to her trip to New Delhi after the next general elections. Maramma's only sorrow was that her son Mohan Rao no longer lived with his parents in the cheri at Chundur. Maramma and Pothayya had seen to it that Mohan got a good education. It had not been too difficult with stipends, scholarships and free hostel accommodation and seat reservation. He had graduated from the Guntur medical college and married the daughter of

an MP who put the newlyweds in a nice little house in Hyderabad after Mohan got appointed as a junior doctor in Osmania general hospital.

Mariamma was not jealous of Maramma's happiness. After all, she was her own sister. But she could not understand, let alone appreciate, her own lot. She and Joseph still scavenged the streets of Guntur. Their own mission school showed no special consideration for Michael, their darling son. So they enrolled him in the municipal school. Since there were no stipends and scholarships, Mariamma took up toilet cleaning jobs in higher middle class homes after the municipal job. She earned enough to buy him textbooks and notebooks as well as clothes which compared favourably with those of his classmates. This she achieved by denying herself and Joseph things that were taken for granted even in Maramma's household. Joseph had a matriculation certificate but his 65 per cent marks were not enough to compete with other applicants for the taluk office job. The posts reserved for SCs were not open for him. His nomination papers for fighting a reserved seat in the state assembly had been rejected by the returning officer during scrutiny. Everywhere, at school, taluk office and election office, they heard the same refrain: "No, no. You may be a scheduled caste madiga. But you are also a Christian! We can't help you. It was no use their saying, 'Christianity is our religion, our faith, not our caste. We remain scheduled castes. Our social status, our economic position has not changed, only worsened compared to our own kith and kin in the cheris who remained Hindus'."

Some of their neighbours and relatives had become neo-buddhists and Sikhs. At first, nothing had changed for them. But by and by, the parliament had amended the president's constitution (scheduled castes) order, 1950 and both Mahendra Kumar and Buta Singh were going places. Joseph could never understand the logic of the government favouring the SCs in certain religions while he was denied his brother-in-law's reservation facilities just because he (Joseph) went to church on Sundays. "What is the meaning of secularism that is told during the election speeches," he wondered.

Joseph attended a mass gathering of ten lakhs in Tiruchirappalli, went to New Delhi for a mass rally at the Boat Club and made trips to Vijayawada, Nalgonda and Eluru for mammoth public meetings. He also signed a petition that was submitted with 50 lakh signatures. But Delhi was not moved to end discrimination against scheduled castes professing Christianity.

Michael passed the 12th class examination with 76 per cent. He wanted to go to college in Guntur but could not make the grade in open competition. Registering at the employment exchange had not brought even an interview card. He could only relieve Mariamma a little by taking over a few of her residential toilet cleaning calls. He was of marriageable age but there was no question of getting a bride from any of the reddy Christian or Christian kamma families of equal financial status. There were no girls of the right age among Christian madiga families either. Luckily, Mariamma could arrange Michael's wedding with Shakuntala whose parents had like Maramma and Pothayya not succumbed to the blandishments of the missionaries.

Mariamma often felt like taking the old padri to task. But then the church had confessed its failure to eradicate casteism among the Christians and had pleaded with the government to recognise the reality and not to deny reservations to Christian converts among harijans. The Catholic bishops' conference India (CBCI), national council of churches India (NCCI) and united Christians' movement for equal rights (AUCMER) have been campaigning for the inclusion of Christians of scheduled caste origin in the constitution (scheduled castes) order. A joint commission of the church of north India, the church of south India and the Marthoma church had urged the government not to view it as a communal problem but consider it a human issue. The minorities commission noted that the social and economic disabilities of dalit Christians are not getting mitigated because their voice is not heard in the legislature where they are unrepresented.

Michael came one day to Mariamma excited. He had a copy of the newly published handout by AUCMER, 'The Cry of the Dalit Christians: an appeal to the leaders believing in Secularism, Human Rights and Equal Justice'. He read out the quotation from Babasaheb Ambedkar: 'To the general mass of the Hindus, the untouchable remains an untouchable even though he becomes a Christian. Michael also read out the statement by Mahatma Gandhi: 'A Harijan may change his garb and call himself Catholic, Harijan, neo-Muslim or neo-Sikh but his untouchability will haunt him during his lifetime.'

Michael told Mariamma it was ironical that

the harijans who remained in the Hindu fold had exercised untouchability by climbing the social/economic ladder taking advantage of reservations in schools colleges and government services. So had neo-Sikhs and neo Buddhists. Why should Christian harijans also be still haunted by untouchability? he asked.

The question became even more poignant when one day their Chundri cheni was torched by those who called themselves upper caste. Families of Maramma Mahendra Kumar and Buta Singh could fight the perpetrators of the atrocities with the weapons of the protection of civil rights act and the SC/ST (prevention of atrocities) act but the likes of Mariamma and her family could only get some ex-gratia compensation payment.

Indignant for a while Michael after some reflection calmed down and wrote to P V Narasimha Rao:

Respected Pradhan Mantri

My parents converted to Christianity four decades ago. They have done their best to see that I grow up to be a self-respecting Indian with rights and duties equal to those of other citizens. They scavenged the streets and made domestic calls to clean toilets so that I could go to school although there were no stipends

and hostel accommodations. But they could not give college education. So I too clean toilets. During these past 45 years the Christian community as well as believers in secularism have pleaded for human rights and equal justice for the scheduled caste converts to Christianity.

Several probe bodies right down to the Mandal commission have shown how we suffer from socio-economic disabilities and educational and cultural backwardness and have recommended statutory benefits on par with scheduled castes professing other religions to us as well. The parliamentary forum of SCs and STs at the historic national convention on June 16-17 1992 in New Delhi recommended our inclusion in the constitution (scheduled castes) order 1950.

The Supreme Court judges in their 8-1 judgment in the Mandal case said that caste does not change with the change in religion and there should therefore be no denial of reservation to us.

The AILCMER and the national coordination committee for SC Christians in symposium have pointed out that upper castes targeted us along with other scheduled castes in Chundri, Karimchedu, Nerkonda and Gokkulipally in Andhra Pradesh. But we alone among the bleeding victims were denied safeguards under civil rights and

atrocities prevention enactments.

Like Rajiv Gandhi when he was prime minister you too have promised to extend us statutory benefits.

We are spread out among all the states and union territories but form a microscopic one per cent minority of the population. Verification of us by revenue officers presents no difficulty as we mostly live in isolated harijan colonies and chenies and are known to all villagers.

We already enjoy non-statutory benefits extended to scheduled castes. So the extension of reservation in the services and in people's representative bodies involve almost no financial burden on the exchequer.

Since no article of the constitution of India needs to be amended but only para 3 of the president's constitution (scheduled castes) order 1950 as in the case of SCs in Sikhism and Buddhism with a simple majority I earnestly plead that you fulfil your promise to us during the term of the present Lok Sabha itself.

I am expecting my wife to present me our first child before the year end. May I expect my child will not miss in life what I and my generation of Christian harijans have been denied?

Yours sincerely
Michael Joseph

NEW FROM SAGE

THE IMPACT OF TELEVISION ADVERTISING ON CHILDREN

NAMITA UNNIKRISHNAN
and SHAILAJA BAJPAI

highlights the impact that television and television advertising have on the values, attitudes and aspirations of children. It provides an insight into the lives of children from different social strata and their respective ways of handling, negotiating and understanding information made available to them over television.

1996 ■ 428 pages
■ Rs 450 (cloth) ■ Rs 245 (paper)

Based on in-depth interviews with over 730 children between the ages of 5 and 15 and some of their teachers, parents and family members, this pioneering book

This volume focuses on the historical, sociological and pedagogical aspects of English language teaching in India. The twenty-two articles in this volume discuss important issues involving the interaction of first and second language acquisition theory, social and psychological aspects relating to learners, language pedagogy in formal settings and the historical, social and educational aspects of English in India.

TADA and Indian Democracy

Sudha Pai

Laws like TADA give extensive powers to the state vis-a-vis ordinary citizens, thus providing grounds for its misuse

THE increasing authoritarianism of the state has long been a major concern for analysts of Indian politics. The 1980s witnessed the enactment and extensive use of laws such as TADA which permit non-justiciable forms of detention. These evidences of state authoritarianism in the face of growing economic and political crises raise questions of public accountability and rule of law as the foundation of democracy.

On March 11 1994 the Supreme Court upheld the constitutional validity of TADA and did not suggest any changes within the structure of the act as it would jeopardise the functioning of parliament. However the judgement records large-scale misuse of the act. The union home minister has admitted it in the parliament. A review committee consisting of secretaries of various departments and police officials was formed to screen out the cases of misuse. Although the points of contention are many the government realised that the act has been misused and a review of TADA cases was begun. These events have initiated a public debate upon the necessity of TADA in a democratic society. Since then under the pressure of public protests the government has announced to amend it although the demand is to repeal it altogether.

The centre for political studies Jawaharlal Nehru University convened a one day workshop on TADA and Indian Democracy on February 11 1995. The workshop addressed itself to the implications of authoritarian measures for the growth of democracy in India and the possible ways in which questions of equity and justice could be dealt with in our society. More specifically the discussion centred upon (a) the factors which permit the enactment of laws such as TADA (b) its use and misuse and (c) whether such an act is required at all on the statute books or should it be repealed or amended.

In his introductory remarks Aswini K Ray outlined the background of the emergence of TADA. The 1980s in contrast to developments in other parts of the world, witnessed the twin phenomena of economic liberalisation accompanied by political de-democratisation. The latter process has been marked by technological modernisation of the security establishment and use of unaccountable coercion by the state apparatus. This has reinforced the process of reversal of democratic rights won after years of struggle in the era of national liberation.

Ray outlined the increasing duality within India's post colonial democracy between an uninterrupted process of periodic elections in the present phase under strict scrutiny by the election commission a vibrant pluralistic print media a strident democratic rights movement encompassing many deprived groups on the one hand and the increasing proliferation of police and para-military organisations and repressive legislations on the other. It is in this context that the debate on TADA becomes a peg on which to hang the discourse of India's democratic governance.

In his inaugural address the chairman of the National Human Rights Commission (NHRC) Justice Ranganath Misra covered a wide range of issues dealt with by the commission with regard to TADA and the problems and limitations it faced. Underlining the importance of transparency accountability and legitimacy in a democratic polity he focused upon the objectionable aspects of TADA and the manner in which it has been used particularly since 1989. It has been brought to the notice of the commission that in most cases it is the police that creates a situation where TADA is invoked. Two incidents that became test cases for the commission mentioned by Justice Misra are the Sanjay Dutt case and the branding of pickpockets on the forehead. Discussing similar legislations in the UK against the Irish people he held that their provisions were not as severe as TADA.

He informed that the commission has been trying to impress upon the government that the act must be withdrawn the reasons put forward being its draconian nature which is against the tenets of democracy its gross misuse its low rate of conviction (0.8 per cent only) which reveals its ineffectiveness and the administration of the statute being left solely to the executive. In conclusion he emphasised upon the need for sensitisation of the police and the public against the act for the healthy functioning of democracy in India. Agreeing with Justice Misra Y K Alagh was critical of brutalisation of power and urged the participants in the workshop to explore institutional mechanisms to resolve the many dualities within India's democracy threatening to undermine the creative opportunities of the new era of economic reforms.

The opening paper by S K Chaube, examined the context and the manner in

which the Constitution of Freedom, i.e., the framing of the fundamental rights took place within the constituent assembly. The steel frame of imperial rules over Indian subjects, limited largely to the Indian Penal Code (IPC) and Criminal Procedure Code (CPC) had generated a consistent and growing demand for rights during the colonial period from the Indian nationalists. This is seen in the Indian National Congress resolution of 1918, the Nehru committee of the all party conference 1928 and the Karachi resolution of 1931 etc. The nationalist preference for fundamental rights with few limitations on them was presented in the draft of fundamental rights prepared by K M Munshi for the fundamental rights subcommittee of the constituent assembly. It was intended to be a legal instrument creating definite and legally enforceable rights and corresponding duties between the union units and citizens of India.

However the nationalist lawyer-freedom fighter approach clashed with two other powerful opinions in the subcommittee. The first the administrative approach of B N Rau drawing upon the narrow colonial system of rights warned against merely enumerating the fundamental rights in general terms and leaving it to the courts to enforce them. This would create uncertainty restrict the power of the legislature and enable an irremovable judiciary less sensitive to public needs in the social and economic sphere than the representatives of the periodically elected legislative body the power to veto legislation. The second the purely legalistic approach of Alladi Krishnaswamy Ayyar held that rights needed to be qualified on grounds of national security public order and morality. It was the latter two opinions which prevailed. As a result Chaube argued the chapter on fundamental rights (part III) of the Constitution reflects the law against which the national movement had fought. This is particularly evident in the discussion on freedom of speech and secrecy of correspondence dealt with in clauses (a) and (g) of article 19 in the Munshi draft. The former was qualified by inserting a provision bodily lifted from the IPC which made publication of any seditious obscene slanderous libellous or defamatory matter punishable. The latter was dropped from the list of fundamental rights as it would give every private correspondence the rank of a state paper and obstruct the establishment of any case of conspiracy against the state. As Somnath Lahiri the communist member observed in the assembly these are fundamental rights from the police constable's point of view. Here we find none of the existing powers of the executive have been done away with."

In any discussion of TADA today, it is relevant to note that even though an elaborate

protection against unreasonable detention after arrest was added in the Constitution, at the same time it excluded preventive detention' from the scope of such protection. This according to Chaube was the cause of the non-availability of 'due process of law' to Indian citizens and the preference in the Constitution for "procedure established by law". In conclusion he pointed out that it is most unusual for a constituent assembly to be guided in the making of a constitutional law by the prevailing criminal law. While the communal situation might have been one of the reasons for this, yet there are clear evidences of colonial legacy in the constitutional law providing space for laws like TADA.

Reflecting on the enormous growth of all central police forces (CPI) in the country since independence and pointing out the feudal and colonial legacies of the police in India Jayatilak Guha Roy's paper emphasised the need for reform of the police system. Referring to the increasing use of police forces, he maintained that even though under the Constitution law and order is a state subject over the years there has been increasing dependence of the state governments on the central police forces (under article 355) which is not a healthy sign for the democratic system in the country.

The paper provided details of the genesis and enormous growth of the CPFs or para military forces in India. Raised as small forces on a moderate budget with limited and clearly defined responsibilities the CPFs have over the years expanded both in terms of size and nature of responsibilities. The Assam Rifles for example raised in 1835 as the Cachar Levy and renamed in 1917 was originally a collection of men poorly armed, partially trained, haphazardly organised, assortedly clothed and miserably paid, all commanded by a civil officer. Today the force comprises 31 battalions and its sanctioned strength is 52,460. The demands made upon the CPFs have continuously increased. The CRPF provides the best example. Beginning as a small unit in 1939 and reconstituted as one of the armed forces of the union under the CRPF act 1949 for maintenance of internal security, it has now become the main force deployed in almost all states/union territories. It has been deployed in various parts of the country to cope with critical law and order situations arising out of naxalite violence, communal riots, terrorism, insurgency, to reinforce state police forces during elections, natural calamities etc. and was also used during Operation Blue Star in Punjab in 1984 and as part of the Indian Peace Keeping Force at Sri Lanka in 1987. Its strength has risen from 870 in 1947 to 1,64,000 in 1994. The number and type of CPFs and expenditure on them

INVITATION TO AUTHORS AND EDITORS

We are pleased to announce the establishment of the "Spell Bound Publications Pvt. Ltd.," at Rohtak – a city situated in the National Capital Region of India – about 50 miles from New Delhi.

The Spell Bound Publications has a target to emerge as one of the world's premiere social science publishers. The reference programme we are launching this year will provide a major service to the whole social science community. This is reflected in the launching of the publications primarily in the following areas:

Business Economics	Environment	Politics
Business Management	Gender Studies	Psychology
Commerce	Geography	Public Administration
Development Studies	History	Rural Development
Economics	Law	Sociology
Education	Philosophy	

Ranging from student texts to monographs, our publications would combine specialist knowledge & expert opinion in areas of study which increasingly demand the world's attention. Throughout our ultimate aim would be to publish exciting & innovative work for the students, researchers & practitioners.

Authors/Editors are invited to write to us

Spell Bound Publications Pvt. Ltd.

have increased since independence reflecting the growing dependence of the state upon use of force. While the Border Security Force with 149 battalions, and the Indo-Tibetan Border Police with over 24 battalions are used to guard the northern borders, the Central Industrial Security Force and the Railway Protection Force are specialised need-based forces, but they are also at times utilised for internal security duties. The National Security Guard (NSG) and the Special Protection Group (SPG) are two specialised forces raised between 1986-88. While the former was raised to meet the emergent threats of extremism and terrorism including hijacking, the latter was raised for providing security to the family members of the prime minister and former prime ministers. These are the most expensive CPFs compared to their strength. For instance in 1993-94, the expenditure incurred by the 3,000 strong SPG was approximately Rs 19.92 crore while the 7,000 strong NSG spent around Rs 57 crore in 1992-93. With the demand for VIP security increasing, there is demand for augmentation of these forces and the annual expenditure of the SPG is expected to jump to Rs 150 crore.

Guha-Roy argued in conclusion that mere increase in the number of CPFs without implementing the required internal reforms within the police system in India to make it more effective will not help in dealing with deteriorating law and order and increasing threats from terrorists, casteist and communal forces and insurgents in the country. He points out that the failure of the government to improve the living and service conditions of the central police personnel, particularly at the lower levels has contributed to the brutalisation of power. They are compelled to live in huts and tents with total alienation from their families for long periods. There is no fixed hours of duty for them and barring the BSI, the internal grievance redressal machineries are ineffective and unsatisfactory. He emphasised that "training in human rights" should be part of the pre-induction programme for the central police personnel before they are sent for counter-insurgency or similar kinds of operations.

Justice Rajinder Sachar in his presentation held that the recent Supreme Court decision upholding the act will weaken the fight for protection of human rights. TADA has already negated various rights that have long been established as essentials for fair trial of the accused and is in conflict with international human rights covenants of which India is a signatory. The most important ground on which the constitutionality of TADA can be challenged relates to section 15 by which confessions to a police officer of the rank of superintendent of police were made admissible as against the general law of

evidence. Another challenge pertains to section 16 of the act which permitted the court not to disclose the names and identity of witness for the prosecution thereby denying the accused his fundamental and effective right to cross examination. TADA also violates article 14 and 21 of the Constitution. He argued that misuse of TADA is evident from the large number of cases recorded in Gujarat which is not a terrorist-affected state and has the low conviction rate anywhere in the country.

Govind Mukhoty emphasised the limited role of the NHRC in dealing with the TADA as it has only recommendatory and not implementative powers. Giving details of various cases of atrocities on women and dalits, and the feudal character of the state apparatus in dealing with such cases, Mukhoty made a strong and impassioned plea for the repeal of the TADA act.

While majority of the participants endorsed the view that TADA must be repealed, different reasons were advanced for the step. Some pointed out that the victims of TADA were usually the minorities or the poor while others held that TADA illustrates the alienation and breakdown of the police force.

The discussion in the second session concentrated on the socio-economic basis of violence, the coercive state and its implications for the reinforcement of democracy in India. Initiating the discussion, Manoranjan Mohanty argued that the authoritarian measures inherent in TADA have a social base and are part of the growing crisis of the state from the mid-1970s. This process creates situations for use of authoritarian measures in order to cope with the crisis. One has to take note of the socio-economic basis of violence in India, the communal problem, the alienation of tribals and of minorities in Punjab and Kashmir etc. Experience has shown that use of repressive measures only creates grounds for further violence. Mohanty felt that on the one hand there is an increasing demand for fulfilment of democratic rights, and on the other the state has resorted to more and more coercive measures. The justification of TADA as being necessary for democracy creates dangers to democracy.

In contrast, Kapil Sibal took the position that the fault lay not with the law, but with those charged with the task of implementation. He cited the anomaly that "TADA is like a surgeon's knife placed in the hands of a butcher". The extraordinary situations existing in areas such as Punjab, Kashmir, etc. necessitate acts like TADA. However, he agreed that the draconian provisions need to be scrapped and the act must be made consistent with ordinary law. As the terrorist problems quantitatively vary in different parts of the country Sibal suggested that the answer lay in (i) looking at the politico-economic

cause of the problem, (ii) increasing the accountability of the persons implementing TADA, and lastly, establishing "a non-governmental independent screening committee to give clearance for prosecution of cases. Gurpreet Mahajan pointed out that a society which adopts a democratic structure of governance must give priority to individual-based civil and political rights although there would be social costs involved in doing so.

In the discussion that followed many participants pointed out that if objectionable elements were removed, then TADA would be indistinguishable from ordinary law, which is the same as the demand for removal of TADA. Opinion remained divided upon the restrictive use of TADA as against its total removal.

Presenting an overview of the provisions of TADA, Harish Dhawan's (PUDR) paper opined that the overriding powers it gives to the state apparatus violates almost every safeguard guaranteed by the Constitution, the mechanism of checks and balances, principles of liberal jurisprudence and natural justice won after years of struggle by the people. By constantly presenting an array of statistics on terrorism, the government has tried to show that TADA is an absolute necessity. However, Dhawan pointed out that the power to legislate is but part of a larger structure that includes the power to coin words, construct images and thereby shape public opinion. Further the manner in which legislation has defined terrorist and disruptive activities makes holding and practising of certain political beliefs a crime. The act has been used by every major political party that has formed a government at the central or state level. The misuse is built structurally into the act for narrow political gains or for 'making a fast buck'. Although initially meant to be used against Khalistanis, the act has been used against minorities, tribals and political activists in various parts of the country thereby giving it a sectarian character. Dhawan felt that the present attempts to create 'TADA with a human face' are reinforcing the arbitrariness of the executive, at the cost of existing institutions of democracy.

Against the background of the implications of TADA on specific cases, N V Baba cited instances from Kashmir to show that violation of human rights go beyond laws. He explained that the process had become a vicious circle in Kashmir militancy creates conditions for repressive laws and vice versa.

Concluding the session Aswini K Ray noted that the workshop helped to underscore the extensive power that TADA gives to the state vis-a-vis the ordinary citizen, its gross misuse, and the need to revoke it. He echoed Justice Mishra's exhortation "TADA must be repealed" because measures like TADA have a built-in proclivity for misuse.

Problems of 'Voucher Privatisation'

Stephen Steiger

'Voucher privatisation' of state enterprises has failed to deal with the problem of the marginalisation of the ownership function which had taken place under socialism

THE proclaimed aim of Czech privatisation - similar to all the other privatisations in Eastern Europe - was 'to find a concrete owner'. It is only such an owner who manages the property economically with responsibility and efficiency since it is he personally who experiences profits and losses of his entrepreneurial deeds and decisions. Few post-revolutionary ideas were accepted by public opinion in such a general way without objections as was this thesis. This is easy to understand if we take into consideration the socialist experience of how anonymous state ownership had been working.

Economic liberalism comprehends the concrete owner as a unity of the execution and ownership functions. The ownership function is titular. When I am the owner then the given property is mine and because of this title I can dispose of it as I wish. This right is being guaranteed by law. However I can delegate the execution of my property to some other person who would dispose of it more skilfully than myself. Such a person could be called a manager.

If the titular ownership and its execution are in different hands then there is a possibility they can be separated or even divorced actually. The ownership function is a titular one only. The ownership and its execution are being divorced on a grand scale especially when execution/entrepreneurship becomes very demanding professionally when it necessitates special professional qualifications which the owner does not have or want to have. The development of industry, technology and technique have gone in this direction. The managerial revolution took place, a part of the broader process of devaluation of property rights and growth of bureaucratic state regulation of ownership. This is what happened in the industrialised countries.

The remedy the neo-conservative political parties in the west began to prescribe against this devaluation is privatisation. This should unite again ownership rights with their execution and thus renew the function and cogency of ownership.

Czech privatisation was accompanied by similar rhetoric. The authorities were looking for a concrete owner to renew the weight of property rights and to surmount the marginalisation of the ownership function which had developed beyond measure under

socialism. The voucher privatisation was regarded as the most effective solution. It seems however, that the above-mentioned problem is not being solved by this method, it even reproduces it in another form.

The authors of voucher privatisation knew that the ownership function was menaced by its marginalisation in the form of an ownership which could be dispersed in the hands of a mass of small shareholders. To prevent a wild breakneck process of gradual concentration of this dispersed ownership, investment funds emerged which executed the concentration in parallel with the course of privatisation.

Yet the problem of dispersed ownership has not been solved in this way. Were it not for the funds the dispersed and marginalised property could have been seized by its executor - the manager of the enterprise. After the disappearance of the state and party representatives the manager could turn the dispersion of the owners and their functional inability to his advantage. This advantage would not represent a reward for his labour but would follow from the imbalanced structure of the property relations.

However the investment funds did not eliminate this possibility - they only gave it another form. An advantage similar to that of the enterprise manager can now be taken up by the fund manager. He is disposing of the property because he is representing its owners - the shareholders of the fund who are dispersed - in other words, mostly imaginary. The majority of the shareholders can hardly apply their ownership function in any way other than by buying or selling their shares on the stock exchange. The petty shareholders should like to be invited to the general assembly which if 'well prepared' can be just a formality. As a matter of fact nothing is being really solved there since everything has been agreed, discussed and 'approved' in advance. One can expect that the process of concentration and sifting of the fund properties is yet to come, but it would be a surprise should it not proceed to the managers' satisfaction. The losers will be - because of the marginalisation of their property function - most probably the petty shareholders of the funds.

The funds manager can even multiply his advantage resulting from the weak control of

the owner by getting directly to the execution of the property in his enterprise, for example, as a member of the board of directors. A kind of a double separation of ownership from its execution takes place. The fund manager is fusing with the enterprise manager. Both groups can behave as owners in spite of not being so and not experiencing the consequences of their ventures on their property.

Under the communist regime the manager was 'responsible' to his ministry, his activities were 'directed' by the State Planning Commission - and the Party 'watched' over all of this. These authorities represented the people's ownership and took advantage of this difference between the imaginary titular owner and the actual real factor they represented. Now when the party has disappeared and the Planning Commission has been dissolved, the 'concrete owner' is being represented by an investment fund (besides the marginalised small shareholders). Thus the real owner is also imaginary to a certain degree, yet the resulting advantage for the managers of both kinds is real.

All in all it appears that after the mass privatisation of the Czech economy the execution of the ownership and the ownership functions have diverged and the managers of the funds and of the enterprises are using the loophole to their advantage. The new structure of property relations should now be examined thoroughly as to its real functioning. The rhetoric about the merits of the 'concrete owner' cannot be a substitute for such examination.

Salvaging 'Traditional' Knowledges

Nirmal Sengupta

By constructing false tradition-modern dichotomy, that which was useful in traditional knowledges was institutionally suppressed. The time has come to recognise the mistake and bridge the fissure

WHAT is our economic strategy? Policy-makers depict as if liberalisation, privatisation and globalisation are panacea of all evils. Critics tend to suggest resurrection of the post-independence policies of closed door state controlled, licence regime. Can we envision a meaningful alternative?

The starting point for such an exercise is not an unscientific passionate appeal to a modern brand of swadeshi but redefining what constitutes development and reassessing what are the resources for development in a country like ours. How do we characterise the present state of our development? After 50 years of independence our achievements are far above nominal. But there are serious shortcomings. For example, even after nearly half a century since independence, we have still not been able to feed, clothe, shelter, educate, employ and extend health care facilities to all our people. If houses can be built only with cement and steel, then it is quite possible that housing for all is a utopian dream. The picture changes substantially if we include in the list the wide variety of materials and techniques traditionally employed by our people in different parts of our land in making houses for themselves. If we include in our plans the wide variety of proven medicines, practices and principles that have been indigenously evolved for health care in our society, then the resource position on the health care front may not appear as bleak as it now seems. If the wide range of materials and techniques that our farmers have traditionally employed to ensure and fertility, pest control, high yield, etc. — are included in the list of resources at our command then the prospect of enhancing food production substantially in an ecologically and economically sound manner may not appear as daunting as it seems now. And so on.

This is not a mere wishful thinking. In the last decade development analysis have undergone substantial change which contests in many a sphere, the existing notions of development. With the discovery of newer and newer technologies once unimportant materials become important resources. The latest in this series of discoveries is in the area of biodiversity. While we have neglected this very rich heritage of ours for years

sometimes even destroyed our traditional biodiversity conservation techniques in over eagerness to show our modernist attitude the world has come to a critical stage where this is one of the most valuable resources. It is this kind of rich heritage which now need the support of modern science and technology to carry us forcefully into the next century.

Another recent development — increasing awareness about environmental problems and sustainability — too has increased the importance of traditional technologies. This has occurred in more than one way. Tradition and sustainability are indeed tautological identities. All that ever occurred in the past were not glorious or sustainable as revivalism tends to think. There certainly appeared non-sustainable practices in the past, even in *Ramayanas*. They did not last. Only those that withstood the test of time are handed over to us as traditional. Only these are the eligible candidates for understanding alternative models of sustainable development. No new model can be declared as sustainable until it has been tested in course of time or in other words has become traditional. The world commission on environment and development (Brundtland Commission, pp 114-15) has drawn attention to this role of traditional societies though in a very limited sense. That does not mean that the past situations can be reproduced or that all traditional systems are sustainable. But important principles of sustainability can be learnt from these traditional systems.

Besides the tools for analysing economic development are also changing. Its consequences are very broad. If environmental impact assessment is integrated into the conventional cost benefit analysis for project selection then many major dams may turn out to be less attractive than the traditional small storages or rainfed farming. The newly developed tools like natural resource accounts or energy accounts impute values not only to production and consumption but also to conservation. There is an interesting consequence to it. If in future these tools are integrated into the social accounting frameworks — which is likely — many tribal communities residing in symbiotic relations with the nature may appear as affluent even

in the modern sense. These are significant for the developing countries. On the one hand these countries must oppose the use of these tools by advanced countries to perpetuate the status quo of extravagant lifestyle by the rich and thrift for the poor. On the other hand these developing countries must also realise that they need to redefine their developmental goals in the light of the emerging valuation methods. Even if by some magic political economic and technological factors eliminating rapid growth possibilities are revoked it will still be impossible to attain the high standards of living of the western countries for everyone. Nature and the problems of resource availability will not allow that. We must have an alternative vision of future which is feasible and sustainable.

The third important reason is not exactly a new one. It is the obtusation of developmental goals by dominant political ideas and vested interests. Every society must build up on its past — developing what is useful and rejecting what is obsolete. But objective judgment has not prevailed in all situations. It is well known that the colonial regime had often discredited the Indian ways and favoured several modern practices that were not necessarily superior in scientific or technological considerations. Even after the independence the sectarian understanding of science of technology remained in vogue. Under the influence of modernisation syndrome one particular kind of lifestyle and values — popularly but misleadingly known as western model of development — has come to be regarded as superior to all others. This is best known to economists through Rostowian model of growth. This paradigm has been amply criticised indicating that this is an apology for neocolonial hegemony — a continuation of the white man's burden thesis. Even radical theories like that of Marx are not devoid of this bias. The west centric views of Marx's writings have been criticised by Marxists themselves. Under the influence of this paradigm people all over the world have desired not just fulfilment of their needs but to fulfil those in some particularly fashionable ways. Consumerism has spread into many undesirable directions. The rich repository of human knowledge has been partitioned from the vantage point of powerful organisations. Modern institutional structures, not scientific methods *per se* came to decide what should be regarded scientifically correct and technologically superior.

False dichotomy of traditional and modern has its origin in the colonial period but it has gained wide acceptance in the last few decades. Under the modernisation paradigm

the indigenous intelligentsia the social activists the philanthropic organisations have become important agents of subversion. The planning of Damodar valley corporation on the model of Tennessee valley project speaks of the great scientific and economic acumen of the builders of new India. At that time one third of the irrigation facilities in the country were from traditional sources. While the colonialists had shown considerable interest to learn from traditional Indian irrigation system the builders of modern India knew little about them and paid no attention to their development potentials. But for that summary rejection there would not have occurred the sharp dichotomy between modern and traditional in the irrigation sector. It soon became unfashionable to talk of traditional systems and the ignorance about Indian reality was legitimised under the garb of modernist attitude.

Or take the case of primary health care. Here too the major onslaught has occurred in the post independence period. Realising that the western medical model was failing to deliver adequate support to the needy in the 1970s agencies like WHO and UNICEF adopted a revolutionary approach to primary health care. The comprehensive approach originally adopted was reduced in practice to oral rehydration therapy and immunisation for child survival. There are two basic approaches to oral rehydration therapy by manufactured packets of oral rehydration salts and by home fluids prepared rapidly and in a less costly manner from cereals and starches which was the traditional practice in many areas. David Werner (*FPW* January 21 1995) describes how from the start WHO UNICEF and USAID put their biggest investment into factory made packets. The result was disastrous. In the last few years the mistake has been realised and lately UNICEF and WHO have begun to place more emphasis on increased home fluids. But after a decade of marketing the packets as wonder drug it is proving difficult to re-educate people. It is in fact proving more difficult to re-educate the health practitioners who have come to believe that the factory made packets are scientifically superior to traditional home therapy.

Because of these various reasons all over the world currently considerable interest is being shown towards understanding traditional technology and traditional knowledge. The purpose is not revivalist but scientific assessment not to go back to the past but to bridge the false dichotomy between traditional and modern. The juggernaut of modernity supported by global institutional bases seems indomitable. The gigantic challenge appears demanding Herculean effort in reorienting the trend. But success stories have also started trickling in. Indonesia initiated successfully a ban on modern

pesticides. Israel has successfully revived its millennia old traditional irrigation systems and Zimbabwe has courageously refused the oral rehydration salt packets in favour of home fluids. None of them have suffered any adverse consequence.

OVERVIEW OF POSSIBILITIES

The process of bridging the fissure between modern and traditional consists of a four-fold task: identification, investigation, improvement and incorporation in the modern society. This process is continuing all the time. We are indebted to our past even for such things as language and agriculture. The exact task therefore, is identifying the neglected but still functionally significant aspects of our tradition and developing them towards their incorporation in the modern society. Note that thereby the technology ceases to be identifiably traditional. This is why we call the dichotomy tradition/modern a false dichotomy. Owing to the colonial heritage and strict adherence to the western model of development we have neglected a lot of traditional resources and knowledge which are useful. Time has come when this fissure between modern and traditional need to be bridged. Thereby we will be able to open a much broader horizon for developmental goal and will obtain much more in both material and human resources to design development not merely for India but for the whole world.

Particularly during the last two decades we have built up a large repository of knowledge about neglected but functionally useful traditional technologies in India. I will briefly introduce a few to substantiate the point.

Agriculture and irrigation are indeed the best examples to establish deceptive nature of traditional/modern dichotomy. Various technologies used here from seed selection to well and canal irrigation have millennia old traditions behind them. Only certain practices introduced later have come to be known as modern. In closer analysis, traditional and modern are existing here side by side complementing each other. This would have been the desirable state of affairs if only the shares of each were determined by their relative merits. But that is not the case. The modern component receives the major share of investment and policy support. Very little effort is made to perpetuate and improve the traditional aspects. This is in spite of the fact that the applicability of many modern techniques is still limited to small areas and to some spheres.

The conventional argument in favour of such a distribution is that the modern mode is more productive. On a closer scrutiny however, one would find considerable institutional support has gone to create this relative advantage. Tubewell irrigation often

thrives on massive rate of power subsidy. Canal irrigation and chemical fertiliser uses too rest on considerable subsidy. No doubt all modern innovations are not of this class. Several innovations have definite merits over the traditional ones. But the choice is made by institutional considerations than scientific and economic merit. If the open and hidden subsidies given to the modern technologies are accounted for many of them would not be economically viable. If apart from productivity other aspects like health hazards and sustainability are taken into consideration the relative advantages change substantially. Increasingly, these other aspects are being considered in valuation systems like cost-benefit analysis. Increasingly problems of perpetual subsidisation is becoming a difficult proposition.

From technological considerations too, some of the modern technologies in use in agriculture and irrigation are not superior to their traditional counterparts. The modern mode is (a) energy-intensive, (b) input-intensive, (c) expert oriented instead of being participatory and (d) sometimes unsustainable. Since each of these criteria have assumed greater significance in recent years interest in traditional systems is increasing in wide variety of areas in agriculture and irrigation, e.g., groundwater identification, techniques of irrigation, salinity and flood control, soil and water conservation, drinking water collection and purification, traditional seed varieties, dryland farming, organic farming, nitrogen fixation methods, green manuring, pest-management and other plant protection methods, post-harvest technology, food preservation and storage, nutritional practices, veterinary practices and livestock management, agro-forestry, aquaculture and so on.

In the area of renewable resource management, like in fisheries and forestry, the traditional modes of resource extraction are currently of great interest among scientists because of non-sustainability of modern production. While this is so the Indian government is dispossessing traditional communities and destroying traditional practices. The government has recently introduced steps like large-scale commercialisation of deep sea fishing and privatisation of forests for commercial interests proposed in the new forest act. Against both these measures there were recently countrywide agitations.

I will not go into the details of biodiversity and intellectual property rights (IPR) questions. Here again the traditional knowledge has been realised as immensely important. Currently, there is race not only for identification and investigation but also to monopolise these knowledges under IPR. The future will see their improvement and incorporation. This is a tremendous resource

it only we can retain our control over it and can use it meaningfully

Industries are considered to be the forte of modern sector. Although in highly truncated and withered forms, a large number of traditional industries still survive throughout the country. These include agro-based industries like gudi, khandasari, sugar, oil, soap, palm products and processed foods etc. metal-based industries like tools, implements, vessels and ornaments, hand-made textiles, silk, paper, jute and leather industry, gems and jewellery, pottery, handicrafts, wood and bamboo works, etc. Not only do they generate lion's share of employment in manufacturing sector, even a significant part of our export earnings still come from those sectors where we have been traditionally strong.¹

During the Indian freedom struggle khadi had become a symbol of national resistance to colonial hegemony. In the post-independence period governments in the states and at the centre have been helpful to cottage and village industries. But the outlook was to use them as mere employment generating subsidised activity. Even in government policies a sharp difference between traditional and modern was maintained. The traditional sector never received due attention of massive modern science and technology research organisations to develop itself. The patronising attitude of the officials also lacked capacity to appreciate the significance of many advanced traditional knowledge and techniques. These, and not the run-off-the-mill productions, are indeed the endowments which are able to impart distinctions in Indian products in the ensuing globally competitive scenario. I will discuss here the case of only one of the industries, the textiles, to give an idea of the wide variety of prospects of traditional industries.

India is the only country to grow all four cultivated species of cotton. American and Egyptian cottons were introduced from the late 17th century till the 1960s. In the present state of cotton cultivation in the country, American hybrids have acquired a predominant position. However, it has been realised that the traditional varieties are definitely superior with respect to pest-resistance, low requirement of inputs like water and fertilisers and general hardiness. Efforts are being made to improve their staple and yield. Some new hybrids are being developed using at least one of the parents from a native strain.

There are definite economic reasons to encourage traditional charkha and pitlooms. The simplest charkha can be used to spin all kinds of yarn - the finest to the coarsest. The simple pitloom can be adapted to weave all varieties of cloth. The rejection of charkha was because of its being a slow instrument having a low productivity. Today, however,

productivity alone does not dictate choice of appropriate techniques. Charkha is also the only instrument to produce cloth by bringing into use two otherwise unused resources: (a) the time of the old, retired and disabled people who have no productivity in the present system, and (b) short-staple cotton cultivable on wasteland as against long-staple cotton required by mills which can be cultivated only on irrigated land using fertilisers and pesticides. Programmes like rural development and wasteland development should seriously look at these possibilities.

Widespread concern over the pollution created in the manufacture of chemical dyes and the health hazards associated with their use has led to a revival of interest in natural dyes. Nearly 8000 dyes and chemicals which are in use in the textile world have already been analysed and many of them have been put into red list to be phased out. The EEC countries have started insisting on eco-labels for various products. The diversity of vegetable and mineral resources and the sophistication of dyeing techniques perfected over centuries makes India a potential world leader in this technology provided of course, the rights are protected, techniques standardised and improved, and extension and training works are undertaken.

The famous Dacca Muslin had lost not to economic competition but to forcible suppression. The very high standards could not have been reached in one product alone. Although the technique of Muslin-making is lost, many others survive. In weaving, printing and designing there still exists lots of rich traditions of quality production. In particular, in the market of quality sarees, different local techniques have earned the significance of brand names and in spite of tough competition from mill-made products, have retained their positions. The skill and the knowledge need to be used imaginatively over a wider range of textile products.

Similar prospects exist for other small scale and cottage industries. In more sophisticated industries the prospects are not as wide-ranging. But still significant gains can be made by studying the traditional methods. In the area of metals and metallurgy, for example, there were such achievements as the Ashok Pillar of Delhi which does not rust. The technique of making it is not yet known, and if understood the knowledge will surely enrich modern metallurgical sciences. Once again, the pillar could not have been an isolated feature. The traditional metal working practices have almost, but not completely, died out. Many traditional metal workers still continue to produce useful objects in their small workshops. If properly investigated, these can still add to the knowledge of metallurgy and metal processing. Some works have been done in areas like the crucible process of making

'wootz', metal working techniques like Dhokra craft and the lost wax process and making of metal mirrors and utensils. Whatever can be added is a definite gain.

Even in the area of electronics and computer softwares, there is scope of using traditional Indian systems of logic, linguistics, mathematics, cognitive science and epistemology. Indian theoretical traditions relied more on numerical discourse than logical. In the era of computers, interests in numerical languages have increased. Already their application in the areas of computational linguistics and numerical processing have borne significant results and several research groups in the country are currently engaged in furtherance of inquiry inspired by traditional theories.

Enrichment of the modern knowledge is only one way of using traditional science and technologies. Another important source is proper utilisation of the skills of traditional artisans. Modern industries are understood as mass scale factory based production introduced after industrial revolution. But in today's world, several modern industries thrive on decentralised organisation of production. Further comparative advantages in production and exports today are obtained more from skill than cheap labour. In many countries in Asia, the traditional artisans and craftsmen have been the major supplier of such skilled worker. In India, however, many communities who were involved in financial and market management in the past, did move over to play similar roles in the modern industry. But they did not take our skilled workers and craftsmen with them to play a more important part in modern industrial production. Partly, it was because within the colonial situation the indigenous financial communities could become traders and moneylenders, not industrial leaders. But even after Indian industrialisation began, the attitude did not change much. The fine-skilled artisanal classes were brought into the modern economy as unskilled labour in agriculture and industry, pauperised from loss of traditional markets. There still is scope of using their skills.

As part of the new basic needs approach, development planners sought ways to make western medical and health service systems more widely accessible to the third world countries through primary health care systems. While the rural penetration of western medicine brought some benefits, it also created new problems. One was the added cost in form of money as well as time spent in travelling etc. In consequence of the spread of modern system, people's faith in low cost home remedies began to decline. It came to a stage when the poor families were required to spend even 30-40 per cent of their incomes on health related costs. Little was left for nourishment after recovery and disease attack.

became a vicious circle. Budding multinational pharmaceutical companies capitalised on this growing drug habits. And currently after the system has been altered by the initiative of governments and international agencies, they are gradually withdrawing subsidies stressing more and more privatisation and cost recovery.

While the dishonest profiteering of Indian pharmaceutical industries need to be checked by providing for patents, the future need to be planned. Per capita consumption of drugs in India is one of the highest thanks to the medical culture that developed here. Unless it is changed, in the new scenario a very substantial part of subsistence will be unduly wasted in the name of health care. Local knowledge need to be revived and revitalised.

In the area of housing we have already told that if houses can be built only with cement and steel then it is quite possible that housing for all is a utopian dream. The number of our homeless is expected to go up from the current figure of about 25 millions to about 45 millions by the turn of the century. On the other hand, our architectural traditions include a wide range of designs, building techniques and material technologies with rich regional variations and local adaptations. It is still a living tradition. A lot of our house building work, particularly in the rural areas, still rely largely on traditional building and depend almost exclusively on local crafts and skills. Lack of access to resources and opportunities is what our traditional designers and builders have been suffering from in the last 40 to 50 years. Our current policies and regulations are marginalising the scholars and practitioners of our architecture. No housing boards consult the sthapatins. New structures meant to be the symbols of our national pride and glory are contracted out to western architects.

In the recent years however, there is an increasing awareness that excessive and exclusive dependence on western styles, techniques and material is neither desirable nor practical in our context. Serious efforts have begun to be undertaken by individuals to explore the contemporary uses of traditional building materials like mud, bamboo, stone, lime plaster, etc. Modern architects are also beginning to realise the capacities of our traditional builders to adapt their skills and knowledge to the modern needs and requirements. The challenge that lies ahead is how to get these things formally accepted for large-scale application and improvement.

THE AGENDA

Two distinct attitudes to traditional social institutions, structures and processes are discernible among educated Indians. The first is characterised by a certain reverence, fort addition, and views tradition as a museum object. In the past this reverence for tradition

rarely went beyond pious wish. Investigations were meant for publication in journals of history and archaeology. Appreciation often was limited entirely to the aesthetic and the decorative dimensions of the products of our traditions, not their functional aspect. These were viewed solely as beautiful relics of a dead and gone past worth preserving. Lately however, reverence for tradition has been misled by political interests, extracting fanatic energies sometimes towards restoration of a temple. On the one hand, these political interests are selective in eliciting aspects of our tradition, carefully avoiding not only the oppressive and exploitative facets but also any reference to the anachronistic moral and ethical standards. On the other hand, they are overzealous in tainting with their own ideological moorings, any scientific inquiry establishing continuing functional significance of our tradition. It becomes a tight-rope walking for a committed investigator to retain a distinct identity from these legitimacy hunters.

The second attitude is characterised by open and unambiguous hostility to anything traditional. This hostility stems from the faith that the greatest obstacle to our progress is the traditional social order and institutions. It is therefore held that only by rejecting the traditional we can build anything worthwhile in India. No doubt, many aspects of tradition need rejection. But a scientific assessment demands not a gross judgment but a case-by-case scrutiny. To many educated Indians, a case by case detailed study of traditional knowledge and technologies seem to be misdirected investment. Unfortunately under the influence of modernisation paradigm even committed social reformers have usually shown this attitude. It was the champions of

Indian independence and development struggle who disregarded investigations into traditional irrigation systems. It is not a corrupt doctor in collusion with company salesmen, but more often a socially committed physician opting to serve the poor, who prescribes the rehydration packets, being driven by a firm belief that this is more scientific than home fuids. The debate on scientific temper and rationalist movements had shown much greater eagerness to develop penchant for criticism of the past practices than scientific faculties of investigation and appreciation of functionally important aspects of tradition. I dare say re-establishing a neglected aspect of functionally useful tradition may require a lifetime of effort. Instead, most science activists will opt for easier course of involvement like timely criticism of syndromes such as milk-sucking Ganesh idols.

In the early stages of our investigations into functionally important traditional phenomena we have faced serious problems from friends belonging to either of the quarters. One group demanded romanticisation and idealisation and were not happy should we also record the exploitative and regressive nature of many traditional systems. The others were impatient critics eager to dissuade us from revivalist trap and technological determinism. The situation has changed considerably. Still, the casualty rate among nascent attempts in this area of investigation is very high. Science movements in the country are acknowledging and spreading the limited set of already accepted findings about the merits of certain traditional technologies. But this is again a communicated knowledge, it does not promote by itself, investigations and validation — both acceptance

ind rejection – of new traditional phenomena. The need of the day is extensive scale of identification and investigation.

The existing norms of scientific inquiry unduly restrict investigations into traditional systems. Existing validation and certification procedures are in reality controlled by institutions although the empire modernisation retains its legitimacy out of a pretension of being scientific and objective. There is no qualm about scientific methods *per se*. But in the area of application it is the institutional sanction and not scientific methodology *per se* which plays a decisive role. Experiments conducted within the confines of laboratories and experimental plots are touted as the most reliable. Improper setting of experiments, careless recording of data, limited range of parameters and obliviousness to the side effects restrict the real scientific merits of accepted norms of validation. Yet laboratory approach tend to be accepted as well tested methods. The silver lining is that unreasonable respect for experimental methods is on the wane. Particularly during the last two decades the use of alternative data bases by consumer action groups, health activists etc. discrediting several certified food, drugs and other materials have partly crumbled the legitimacy of the existing institutions of validation and certification procedures. The claims of superiority of in house and controlled experiments in scientific validation procedures is also under doubt. Alternative validation methods like long history of successful application thus find a better climate today for acceptance. The consequences of many traditional practice used by millions for generations are evident. These are often expressed as folk knowledge of various matters. It is possible to use that data as meaningful to draw conclusions about their merits and demerits. Investigations into traditional systems can prosper only if this alternative method of validation is accepted on a wide scale.

The objective of this exercise is of course improvement and incorporation of traditional science and technology in the mainstream. Not everything requires improvement. But all that does not require immediate improvement are not condemned. Currently useful functions need perpetuation. And for perpetuation sufficient support measures must be extended. In the cases of many traditional systems little effort is given towards their perpetuation. Many of them have continued to this date with great difficulty. But continue they did being essential for day-to-day life of the people. Traditional irrigation systems are an excellent example. Although they still provide the major share of irrigation in several states, and there is no suitable alternative to them for more than a half of the land area

in the country, the general attitude is one of condemnation. Little financial, legal and technical support is received by many of these techniques. Incorporation in their cases means extension of support measures for their perpetuation.

Extension and improvement are only the next steps. These requires investment be it by individuals through research time or by agencies in terms of finance. Any investment presumes an amount of trust in the future prospects of the object. This was what was badly lacking in the past. Although climate has improved, even now it is difficult to get financial support for developing methods of standardisation of natural dyes or for extension of traditional pest-control methods. Recently introduced courses of alternative medicine remained vacant – understandably students hesitate to commit themselves for a lifetime. Indeed, it is the established scientists and practitioners who alone are able to invest parts of their time and money in such ventures. Also greater entrepreneurship is shown by multinationals and international agencies. They are able to make considerable investments in developing information bases. The data often point to bright prospects in many areas of traditional science and technologies. One can only hope that the climate of investment in general, will change in proportion to the success and investigations, improvement and incorporation of functionally significant traditional science and technology.

That brings us to the last question – what kind of incorporation do we envisage? This is not merely a task of administration, management training, extension. Distribution of benefits is a major issue. Some approach may lead to monopolising knowledge by a few. Some others may lead to equitable and sustainable development. In retaining their traditional expertise, some members of artisanal communities have faced serious odds in the past. But today, in spite of increased interest in the society, they are not very secure. There is a strong likelihood that their knowledge will be misappropriated leaving them as pauper as at present. Many tribal communities have retained the biodiversities of the country. By not exploiting it they have remained poor so long. In the question of incorporation one must also consider which approach will benefit the tribals and in which the knowledge will be stolen away from them. The contribution of ethnobotanists in enriching the drug companies is by now, well known.

In general, in any development programme today the question of distribution is of crucial significance. Designing suitable approach that favour the women, the downtrodden and the deserving instead of being a privilege for a few is a great challenge. Whether the nature of dissemination will lead to community

based practices of self help or will be expert-dependent depends on the approach we are able to adopt at this initial stage. Participatory approach to development and realisation of grass roots democracy also requires appropriate orientations in science and technology. Currently, traditional communities are being dispossessed at a very fast pace. Although it is said that this is the inevitable consequence of the advent of commercialisation, closer look reveals that is far from the truth. Artisans are losing grounds not always because of inferior production techniques but also because of deliberate interventions in their channels of raw materials supply, preferences shown by officials to uses of factory-made products and similar institutional suppressions. The recent steps taken by the government in fisheries and forestry to promote multinational and large company interests were met with countrywide protests. Those who reason that economic progress rests on commercialisation conveniently overlook that the artisans, the fishermen and minor forest product collecting tribes have always been practising commercial activities. The institutional design to dispossess them is strictly violation of their rights to livelihood.

Notes

[I acknowledge my gratitude to numerous scholars and activists whose contributions have been used here. Many of the findings mentioned were presented at the First Congress of the Traditional Science and Technology in India in IIT Bombay, November-December 1993. They are available in the Proceedings of the Congress. Remaining findings were not part of the Congress. However, the views expressed in the paper are my own.]

1. This realisation had led, after the first Traditional Science and Technology Congress, to the citing of figures like 40 per cent and 60 per cent as the contribution of traditional sector to Indian exports. I am told one such citation was by P V Narasimha Rao in Jaipur Science Congress. The supporting data for such statements may be as

Percentage Share of Exports	
Gems and jewelleryes	18.1
Ready made garments	11.7
Leather and footwear	6.1
Handicrafts	4.2
	40.1
Agriculture and allied products	16.0
	56.1

However, I do not favour this kind of analysis for there is no strict compartmentalism between traditional and modern sectors. The contribution can be judged only qualitatively. Strong traditional production areas is one of the important characteristics which give us a relative advantage over others in certain products in the global market.

MADRAS SCHOOL OF ECONOMICS

Madras School of Economics (MSE) is a Centre of post-graduate studies in economics which strives to maintain excellent standards in teaching and in research, comparable to those maintained by well known international centres. MSE started its P.G. Diploma course in August 1995. The Ph.D. programme will commence in July 1996 to be followed by M.A. Programme in July 1998.

Faculty Positions

Hindustan Level Chair in Industrial Economics: Professor
Professor/Reader in (i) Capital Markets and Financial Services and (ii) Environmental Economics.

Research Fellows

Candidates for Professor/Reader must have Ph.D. with an outstanding academic record in their fields. They must have the capacity for rigorous theoretical and empirical research and publications in standard professional journals and/or books which have been judged to be of high quality. Candidates for Research Fellows must have Ph.D. with good academic record and at least one refereed publication.

The gross salaries at the minimum scales of pay are Rs. 15,500 p.m. for Professor, Rs. 11,500 p.m. for Reader and Rs. 7,000 for Research Fellow. MSE will also consider appointments on contractual basis for periods ranging from one to two years.

Interested candidates may send their applications along with curriculum vitae and names of two referees to the Director, Madras School of Economics, C/o Centre for Biotechnology, Anna University, Madras 600 025, INDIA on or before January 16, 1996. Fax 91-44-235 2155.

GUJARAT INSTITUTE OF DEVELOPMENT RESEARCH

Gota 382 481, Ahmedabad

GIDR invites applications and nominations for the position of **Director**.

The Director is expected to be an eminent scholar and researcher, conversant with academic administration and willing to interact with governments, development agencies and the community at large.

Established in 1971 as the Gujarat Institute of Area Planning, the Institute has been receiving an annual maintenance and development grant from the Indian Council of Social Science Research since 1987-88, with a matching grant from the Government of Gujarat. These grants and other assured income cover about 55-60 per cent of the total annual expenditure; the balance is raised from projects.

The Institute's faculty has a record of research and publications in crucial areas of socio-economic development including population, health, education, labour, rural development and poverty. The results of faculty's work are frequently used in discussions on public policy at various levels.

The Director will be appointed initially for a period of five years. At present, the emoluments correspond to those of a Professor according to UGC norms, with a special monthly allowance of Rs. 500/- p.m. and a telephone. A suitable accommodation will also be offered.

Applications and nominations accompanied by detailed bio-data should reach the President within six weeks of the appearance of this announcement at the following address.

Dr. Kirit Parikh, (President, GIDR)
Director
Indira Gandhi Institute of Development Research,
General Vaidya Marg
Goregaon (E), Bombay 400 065.

Relevant Macroeconomics

Vinod Vyasulu

Macroeconomics for Developing Countries by Raghendra Jha, Routledge, London and New York 1994

It is one of those ironies of life that this book came along just when I had retired from the teaching world. Macroeconomics is the one branch of economic theory that appears to have immediate policy relevance and teaching the subject can be a challenge especially to good students.¹ In recent decades most books on macroeconomics have presented either simple minded Keynesian prescriptions or simple minded Chicago ones. This book also has the Keynesian touch but not in any rigid way as it consciously tries to go well beyond that limited perspective. I would therefore have loved to teach a course with it as the basic text for it enables one to discuss issues of importance to developing countries without sacrificing rigour and without asking the student to wait till she has learned the tools of the trade before addressing questions that are of interest to her. Till then she has to study utterly unrealistic models!

What Jha has provided is a textbook that combines the rigour of neo-classical textbooks with an openness of mind that is quite uncommon in that school: the line between rigour and rigor mortis is clear and distinct. Compare this book with other standard texts such as Branson. The latter would appear to subscribe to the view that there is such a thing as Economic Theory which is both Objective and True and go on to present one version of it. Anything else in this universe is not Science. In contrast Raghendra Jha acknowledges that there may be many points of view not all of which agree with one another. And so far as the student is concerned he tries to present different viewpoints highlighting their strengths and weaknesses. He gives the student the opportunity to make up his or her own mind in this matter: the book itself deliberately takes an agnostic position. For a textbook this is a welcome feature.

After going through the main themes that constitute the core of modern macroeconomics Jha has a section on alternative approaches. And in each chapter he makes an effort to relate what has been discussed to developing countries. And he has three archetypes – the Latin American, African and South Asian – of this group thus both avoiding over-simplification and making the point that there is great diversity within the developing countries themselves that needs to be carefully taken into account in theorising. Thus in his teaching in the west, he has exposed students to something of develop-

ment: this is something that is most welcome. We who use these textbooks here uncritically should be grateful that such a discussion has indeed been included so that we as teachers can expand and elaborate on these issues without apology in our own colleges and universities. Of course macroeconomics approached *de novo* in the specific context of developing countries would be most welcome. We have to wait for such a book. Till then this is one of the best I have seen.

There are many advantages in terms of facilities, opportunities and academic interaction in writing such a book while teaching abroad but the limitations too, in terms of the approaches that are acceptable and questions that are considered interesting, must be understood. It is not very surprising that there is no mention of the Paul Baran and Paul Sweezy analysis of the US macro scene in which government intervention would necessarily show up as increasing military expenditure nor of the less radical military-industrial complex characterisation of Galbraith which is much more Keynesian in its inspiration. Nor is Kaldor's very popular. These works rarely find a place in the academic scene in America (these economists are more widely read in this country). This apart, Jha's efforts at presenting plural views deserve special commendation.

The book is divided into four parts. Part One deals with mainstream macro, in a closed economy. Part Two deals with an open economy. The material in these sections is standard and to be found in many other text books. This one adds a discussion of the relevance of tools studied to developing countries and that places it in a different market niche.

Parts Three and Four, on alternative approaches and key policy questions in developing countries are unique to this book. Jha makes the point that for LDCs what is important is long term growth and not short-term stabilisation. Of course, this does not mean that stabilisation is unimportant. It just means that it must be seen in the right perspective.

The first section has a clear Keynesian flavour, discussing as it does national accounts and related concepts. It then goes on to the 'neoclassical synthesis' or an exposition of the IS-LM analysis developed by Hicks and refined by many others. The creation of money, the role of interest and so on are clearly discussed (see pages 78 to 81, for

example). The real balance effect and the money illusion are duly dealt with. When trade is introduced the treatment retains its rigour in the discussion of different conditions with fixed and flexible exchange rates, both diagrammatically and in algebra. It is all very user friendly. The book is easy to use because material is divided into clearly marked sections each dealing with a specific sub-theme which are then all brought together at the end.

And, for a book published in 1994 the approach of rational expectations or how people use all the information available with them finds its due place. The work of Krugman and the new trade theorists also finds a place in the treatment. Truly Jha has brought research questions of recent years into the classroom. I would have liked to see the strategic implications of this work for developing countries elaborated upon in greater detail. The book also devotes space to the assignment problem, the need to have as many independent policy instruments as targets and to assign an instrument to the target where it has maximum impact. This is a welcome feature not generally found elsewhere. The various analytical tools are clearly explained and the student who works through the diagrams should be ready to venture into the world of journals to pursue his or her own interests independently.

Chapter 9 in which a stylistic macro model of a developing economy is built is an important contribution in a macro text drawing its inspiration from the structuralist school of which Lance Taylor is perhaps the best American example. Aggregate supply and aggregate demand are discussed with developing country features built in. Equilibrium is examined and the policy options like monetary contraction and devaluation are examined. The different results that emerge are explained for example how devaluation may lead to inflation. In Chapter 10 dualism is introduced and discussed in the Keynesian and neo-classical frameworks. Chapter 11 is devoted to an understanding of inflation: the empirical data in Table 11.1 gives an important focus to the discussion. All this provides the base for the discussion in Chapter 12 of the IMF Stabilisation package and the criticisms levelled against it. For students in India this should be particularly useful. For teachers it provides the point of departure to discuss the new economic policy. And if they so choose, even to criticise it.

The last section is devoted to the major issues of debt and 'repression' or physical and quantitative controls and their costs. This discussion is useful, but limited: the issue is not so simple as this model suggests. The various dimensions of regulation and regulatory institutions need much more discus-

sion. But it provides a useful starting point, and that is what I appreciate.

This book helps teaching macroeconomics in developing countries like ours in a rigorous way. If I were using it as a text, I would supplement it with others such as Bhaduri,⁴ and Rakshit.⁵ Bhaduri's book to introduce the student to the work of Kalecki (whose name appears in Jha's bibliography but not in the index), and Rakshit's for its analysis of the dualism model. Both would serve to round off the material for the Indian student. From there the student can move on to other things, for example Pasinetti's recent work on structural economic dynamics,⁶ although this would be a big jump as issues of technology, learning, and other things will have to be brought in from elsewhere.

Other books that have recently appeared would make a student's life easier and also add to the value of an Indian macroeconomics course – for example, those by Pulapre Balakrishnan,⁷ Narendra Jadhav,⁸ and Uma Datta Roy Chaudhuri.⁹ I am also surprised to see no reference to the work of Prabhat Patnaik: for example his 1984 R C Dutt lectures.¹⁰ But then, one cannot expect everything from Jha: he has done enough, and provided us with an excellent text. Something must be left for the teachers themselves to do.

Notes

- 1 There is a view that economic analysis is about proving interesting theorems; policy is the business of those who make

value judgments. If the initial distribution of income and wealth leads to an equilibrium that is not satisfactory, then that should be changed. How this is to be done is not addressed. In macroeconomics such detachment is not very easy.

when he realised - revealed for the first time in this book that it was a lost cause. To such comments and angry protests, McNamara pleaded understanding and provided his version of the situation then: "We all believed that if the US let Vietnam go, communist China and the Soviet Union would be tempted to flex their muscles elsewhere in the world - and a nuclear confrontation would be all but inevitable". And he concluded thus: "I don't agree with that analysis now. At that time the danger of communist aggression was very real and very substantial. In retrospect, US could have withdrawn on any one of several occasions - between 1963 and 1973 - and the dire predictions would not have materialised".

Lastly, while the sight of the aged and sad McNamara on his intensive tour to promote this book, alternately grovelling and pleading for understanding or even acceptance of his personal sorrow every moment of the way, has prevented many in US from reading it, in anger or disgust - but Vietnam grabbed and published a pirated Vietnamese version of this book in May 1995 by the Hanoi-based, state-owned National Political Publishing House. This pirated Vietnamese version was released with an additional preface by the local publishers which maintained that "McNamara's assessment and conclusions may be different, even contrary, to ours, nevertheless we hope this book will provide our readers with useful information, helping us to a deeper understanding of our nation's struggle... After three decades, we have some one talking on our sufferings and sacrifices."

For several reasons, *In Retrospect* is a must read. This is the most detailed book from the highest-ranking US policy-maker we ever heard on the most brutal and barbaric Vietnam war. All three of the important presidents who relentlessly escalated the Vietnam conflict in the late 1950s through mid-1970s died without casting much useful light on the history of what is generally known as 'McNamara's War'. More crucially, one has to read it because of the stories 'I was there' feature. In addition, this book has several fascinating and provocative narrations that match the confessions of a serial killer. For the first time, new material from Kennedy and Johnson presidential archives is researched and published. As the blurb to the book notes: "We hear presidents talk; we sit in on secret meetings, we read private cables, and we hear the voices and arguments of the men who battled over America's Vietnam policy". It provides deep insights into US administration, its defence establishment and the CIA.

This book is divided into 11 chapters with a detailed appendix, bibliography and notes wherein McNamara appropriately examines the mechanics, lapses, politics, enthusiasm and senselessness - especially irrationalities - involved in war-making at the highest level's of the world's superpower. The contents of

Ignorance, Arrogance and Vietnam War

M S Shivakumar

In Retrospect: The Tragedy and Lessons of Vietnam by Robert S McNamara with Brian VanDeMark, Times Books, USA, 1995; pp xviii + 414, \$ 27.50.

A brief note on the timing, style and events that surrounded the launching of this book might be revealing. It was released in March/April 1995 when Vietnam was preparing itself to celebrate the 20th anniversary of its victory over US, and the ceremonious integration of south and north into one nation. During that time US-Vietnam dialogue on normalisation of diplomatic relations was progressing well: indeed, in August 1995 secretary of state Warren Christopher visited Hanoi and opened the US consulate signifying 'return of the normal' era. Robert McNamara, author of the book under review, and a former US defence Secretary, is expected to visit Vietnam early October 1995 for the first time since the war. He will join a group of historians and archivists, who hope to persuade Hanoi to take part in a conference on the Vietnam war in the latter half of 1996. This effort is expected to use the documents on the conflict which are now regularly declassified, initiate discus-

sions and record 'facts' of that war. It is sponsored by the New York-based Council on Foreign Relations.

In April, McNamara came to Kennedy School of Government, Harvard University, to seek publicity for his book and declared that "in continuing the Vietnam war we were wrong, terribly wrong". Old emotions returned with a vengeance and as he spoke a small group of protesters milled near the building's entrance. They were mainly Vietnam war veterans, not angry students who in 1966 forced McNamara, at the height of the Vietnam war, to flee through the campus' underground tunnels. Several veterans screamed: "There are several indications that you had doubts as early as 1965. Now you tell us that we fought, lost and several died for 'geopolitical reasons'. Is this not a vulgar explanation? Your book and your presence is an obscenity." Unforgiving veterans wanted to know why McNamara did not stop the war

his book can be divided into three broad parts. One, McNamara's years under two presidents, i.e. John F. Kennedy (January 1961 to November 1963) and Lyndon Johnson (November 1963 to his departure from Pentagon in February 1968) where he provides a broad and sharp overview as to how did the US administration [and presidents] arrive at decisions? Two, McNamara looks at a few important particular incidents that generated intense debate and controversy. For example: (a) the Tonkin Gulf Congressional Resolution of August 1964 (b) The six months between January 28 and July 28, 1965 saw the US embark on a course of massive military intervention in Vietnam, an intervention that ultimately destroyed Lyndon Johnson's presidency and polarised America like nothing since the civil war, and (c) periodical bombing pauses that were expected to bring Vietnam to the negotiating table. How did such incidents condition the course of the events? How did the US administration handle such crisis situations? Three, McNamara responds to persisting questions such as: 'Was the Vietnam war inevitable? Did US really learn lessons from the Vietnam war?'

BACKGROUND

During the early 1950s and particularly after the beginning of the Korean war, the Americans saw France's colonial war in Indochina as an important part of the world-wide struggle against communist expansionism. By 1954, US military aid to the French reached US \$2 billion (at 1950 rates). In 1950, about 35 US soldiers arrived in Vietnam as part of the US military assistance advisory group, ostensibly to instruct troops receiving US weapons how to use them. American troops remained on Vietnamese soil for the next 25 years. At about the same time, US State Department was rumbling with recriminations over who was to blame for 'losing China' to communism – later, it recognised that Bao Dai's government was a reaction to those events. From that point to date, US policy in Indochina has been a reaction against whatever the communists do.

When the last French battalion left Vietnam in April 1956, the US soldiers, numbering a few hundred, assumed responsibility for running the South Vietnamese military. As the military position of the South Vietnamese government continued to deteriorate, the Kennedy administration (1961-63) sent more and more military advisors to Vietnam. Despite growing opposition in the US, president Johnson and his successor Nixon continued to pour American troops into Vietnam, at the same time beginning negotiations with North Vietnam leaders. Millions of refugees poured into other nations. In 1969, the US began secretly bombing neighbouring nations like Cambodia and Laos. This new escalation nurtured previously quiescent elements of

the American public, leading to bitter anti-war protests. Australia, New Zealand, South Korea, Thailand and the Philippines sent military personnel to South Vietnam as part of what the Americans called the 'Free World Military Forces' whose key purpose was to internationalise the American war effort and thus confer upon it legitimacy. In April 1975, US forces left Vietnamese soil and leaders of South Vietnam surrendered to the North, commencing integration of two zones into one nation.

WAS THE VIETNAM WAR JUSTIFIED?

McNamara succinctly (and page after page) agrees that continuation of Vietnam war was not justified; however, he is silent on 'whether the beginning of the war itself was based on some sound reasons?'. On this question, he provides a round about response. He admits that during Vietnam crisis, US administration was pursuing efforts to 'contain' spread of communism and operated on two premises which were contradictory, viz, the fall of South Vietnam to communism would threaten the security of the US and the western world, and that only the South Vietnamese could defend their nation, and that America should limit its role to providing training and logistical backing.

In support of this, he extensively quotes several meetings, discussions and notes exchanged. In particular, he mentions the meeting between the then president Eisenhower and president-elect Kennedy on January 19, 1961.

We covered an immense number of subjects that afternoon, but the emphasis was on Indochina. Focus in that part of the discussion was actually on Laos, not Vietnam. President Eisenhower stated that Laos is the present key to the entire area of south east Asia. If Laos were lost to the communists, it would bring in an unbelievable pressure to bear on Thailand, Cambodia and South Vietnam. If Laos is lost to the 'free world' in the long run, we will lose all of south east Asia. Thus, at the time of transition of presidents, Indochina was seen as the test-case for US in implementing its '321' containment policy of communist expansionism. In bare words, the earlier principal argument by the US administration that it was Hanoi's quest for regional hegemony that forced the American intervention and invasion now stands erroneous.

Did the US policy succeed? Certainly not, asserts McNamara and deduces that "we badly misread China's objectives and mistook its bellicose rhetoric to imply a drive for regional hegemony. We also underestimated the nationalistic aspect of Ho Chi Minh's movement – we equated Ho Chi Minh with Fidel Castro – such ill founded judgments were accepted without debate by the Kennedy administration as they had been by its Democratic and Republican predecessors. The

foundations of our decision-making was gravely flawed' (pp 32-33). Then, McNamara makes an inventory of 'eleven key events' that logically emerge as errors of omission and commission of US leadership and administration. However, defence historians and analysts argue that these key events could not be examined in isolation but are to be studied as part of the containment policy of US. For example, vis a vis Cuba or China, nevertheless, they squarely place the burden of responsibility on the US administration for this misdemeanour in Indochina.

In his effort to make the reader understand the situation, he returns repeatedly to the overwhelming dilemma of the US Vietnam war. On the one hand, America was primarily dedicated to assuring South Vietnam's right to determine its own future, knowing that if the country failed to help itself, the mission had failed. On the other hand, McNamara and all his colleagues saw almost daily evidence that the South Vietnamese were dodging hard work and depending on the US to assure self-determination. Nevertheless, he avoids discussing the arrogance of US in claiming that it could do the job. Overall, intervention in Vietnam began only to contain communism and was never expected to develop as a major war. There was no sound geopolitical reasons either. Thus, the US intervention remains as an unwarranted action with no rational foundation.

ESCALATION OF WAR

McNamara claims that US never declared war and had no direct interests in its outcome. Then, how did the war intensify? Was the escalation based on better understanding of the circumstances? He acknowledges with a strong 'no'. For example, here is the personal confession in regard to Asia when he assumed post as defence secretary and knowledge of other members: 'I had never visited Indochina, nor did I understand or appreciate its history, language, culture or values. The same must be said to varying degrees about president Kennedy and others. When it came to Vietnam, we found ourselves setting policy for a region that was *terra incognita* – with innocence and confidence we approached Vietnam in the early days of the Kennedy administration. We lacked experience dealing with crises. Finally, and perhaps most importantly, we were confronting problems for which there were no ready or good answers. I fear that in such circumstances, governments – and, indeed, most people – tend to stick their heads in the sand. It may help to explain, but it certainly does not excuse, our behaviour' (pp 37-39 and 40). Those at the helm of affairs were ill informed or had no better understanding of Asia and presumably decisions taken were poor and irrational.

According to him, apparent change happened by the fall of 1961 as guerrilla infil-

etration from North Vietnam into South Vietnam had increased substantially, and the Vietcong had intensified their attacks on Diem's government. At this stage senior officials suggested that the US recast its policies in a transition from advice to partnership. On November 8, 1961 McNamara submitted a brief to president Kennedy agreeing with the above policy change. Thus, he was instrumental in arriving at the wrong decisions based on inadequate reading of the situation. Contradictorily, he claims that in line with above policies and efforts, the US actually began planning for the phased withdrawal of its forces in 1963, a step adamantly opposed by those who believed it could lead to the loss of South Vietnam and very likely all of Asia (pp 30). Did this containment of communism policy work in the US's favour?

McNamara claims that way back on November 8, 1961 he was uncomfortable with the decision that allowed additional reinforcements to be sent to South Vietnam and offers some evidence in his defence. As soon as I sent the memo to the White House, I started worrying that we had been too hasty in our advice to the president. For the next couple of days, I dug deeper into the Vietnam problem. The more I probed, the more complex the situation appeared to be and uncertainties of our ability to deal with it by military means became apparent. I realised that seconding Taylor Rostow had been a bad idea (pp 38-39). Highly catastrophic decisions were taken despite personal ignorance.

On the strategies he says, 'The joint chiefs agreed we should prepare plans for US air strikes against North Vietnamese targets and the Ho Chi Minh Trail with the objective of destroying Hanoi's will to fight and its ability to continue to supply the Vietcong. That in conjunction with our later ground effort eventually became the military strategy we followed in subsequent years' (pp 152). How did this and other such strategies fail?

If one agrees with the claims of McNamara, then it was the defence establishment which consistently furnished a rosy picture and repeatedly asked for more reinforcement of men and supplies. Civilian administration merely obliged them as implementing the containment policy was considered as critical for the free world. Nevertheless, he provides clues to his personal involvement in decision-making that confirms the impression that Vietnam crisis was McNamara's war. Overall, he admits that once you had US soldiers fighting and dying, the administration was forced to protect and support them, including committing more troops and funds. Consequently, the war was escalated. But this fails to explain the severity of the war.

It is obvious that US was not prepared to accept a long war while the Vietnamese were determined to fight until the end. At the battle field, some of the fundamental mistakes of

the American administration had devastating consequences for the US troops. The gradual escalation, for example, in the hope that each step would prove the last, meant only that the US had surrendered the initiative to its rivals. Similarly, US strategists simply assigned each pilot 100 air raids, an arbitrary number assumed as near victory figure. As documents now establish, US pilots were more concerned with staying alive than hitting their targets. It was a kind of involvement for which neither American society nor its military were prepared.

He admits that the personal understanding and knowledge of senior officials of the White House was weak. Therefore, several crisis management teams and networks to mobilise information were established. At the defence department and US administration, there were many tiers of information gathering, sharing and decision making, viz., White House cabinet, defence establishment, CIA and several Vietnam committees were based in US. In South Vietnam (and in other bases like Thailand or Philippines), ambassador and diplomatic personnel, field leaders of military and informants formed a cluster of decision making. Interestingly, McNamara has good words for the CIA and their assessment. In addition to such information routes, during his tenure McNamara personally made several weekend trips to Vietnam or Hawaii for consultations. In spite of such well organised information and analysis network, US's performance was woeful.

He argues that 'Some critics have asserted that the US lacked a military strategy in Vietnam. In fact, we had one—but its assumptions were deeply flawed. Beneath West's [Westmoreland] strategy lay the implicit assumptions that pacification and bombing would prevent the communists from offsetting losses inflicted by US and South Vietnamese army forces through recruitment in the South amid war and to reinforce from the North in the face of our air attacks' (pp 210). Finally, he agrees that 'All these assumptions proved incorrect. We did not force the Vietcong and North Vietnamese army to fight on our terms. We did not wage an effective anti guerrilla war against them. And bombing did not reduce the infiltration of men and supplies into the South below required levels or weaken the North's will to continue the conflict' (p 211).

A close reading of the works of other defence historians, analysts, journalists and McNamara's book itself shows that US administration was not willing to look at the realities but remained inflated with its gains made during the second world war, Korean interventions, etc. Finally, he concludes that 'the best and the brightest Americans led us into tragedy'.

The closest the US came to a declaration of war in Vietnam was the Tonkin Gulf Resolution of August 1964. The events sur-

rounding the resolution generated intense controversy that continues to this day. It was an important turning-point in US strategy as two American destroyers, the Maddox and the Turner Joy, claimed to have come under 'unprovoked' attack while sailing off the North Vietnamese coast. Here McNamara's arguments remain illogical. On the Tonkin Gulf incidents and congressional resolution, he writes, 'The key questions and my answers are these: [a] Attacks by North Vietnamese patrol boats against US destroyers reported to have occurred on two separate occasions, August 2 and August 4, 1964. Did the attacks actually occur? Answer: The evidence of the first attack is indisputable. The second attack appears probable but not certain' (p 128).

In this reasoning, McNamara overlooks vast information now available which convincingly establishes that the first attack took place while the Maddox was in North Vietnamese territorial waters assisting a secret South Vietnamese commando raid and that the second attack simply never took place. He continues, 'At the time—and still more so in later years—some elements of Congress and the public believed the Johnson administration deliberately provoked the attacks in order to justify an escalation of the war and to obtain under a subterfuge congressional authority for that escalation. Does this view have any merit? Answer: None at all' (p 128).

Even here, his reasoning is faulty. In fact, a few days after the Tonkin incidents were reported, an indignant (and misled) Congress almost unanimously (only two senators dissented) passed the Gulf of Tonkin Resolution which gave the president the power to 'take all necessary measures to prevent further aggression'. Until its repeal in 1970, the resolution was treated by US presidents as a blank cheque to do whatever they chose in Vietnam without congressional regulation. Such an analysis, even he agrees, rather reluctantly.

The fundamental issue of Tonkin Gulf Resolution involved not deception but rather misuse of power bestowed by the resolution.

Congress expected full consultation before expansion of US forces in Vietnam (p 142). However, that was not to be. Substantial evidence is now available to prove that Congress was not fully kept informed of the developments in Indochina and public received massive propaganda material of the US administration. For example, William Shawcross in an excellent analysis of Nixon administration's manipulation of power demonstrates as to how the Gulf of Tonkin Resolution was used by the US administration for many years and how decisions made in Washington affected the lives of one particular and distant people of which the Congress was not probably aware of [*Sideshow*, The Hogarth Press, 1979].

Did the US administration mismanage only the Vietnam war? It will be a definite 'no' if the fresh material McNamara provides (as

an appendix to this book and known for the first time) on the Cuban Missile Crisis of 1962 that brought Soviet Union, US and Cuba to the verge of war is accurate. But what was not known then, and is not widely recognised today, was how close the world came to the brink of nuclear disaster in 1962 based on "distorted information, misjudgment, and miscalculation" (pp 338-40). He admits that the experience of the Cuban Missile Crisis makes clear that so long as superpowers possess large inventories of nuclear weapons, the world will face the risk of their use! Despite such possible threats, periodical mismanagement and bungling by the US administration, he pleads: "The point I wish to emphasise is this: human beings are fallible. We all make mistakes. In our daily lives, they are costly but we try to learn from them. In conventional war, they cost lives, sometimes thousands of lives. But if mistakes were to affect decisions relating to the use of nuclear forces, they would result in the destruction of whole societies. Thus, the indefinite combination of human fallibility and nuclear weapons carries a high risk of a potential catastrophe" (p 342). This is a remarkable transformation of a war hawk to a peace dove!

Vietnam war was known in US as 'McNamara's war'. Anti-war sentiment was solid in US and elsewhere, and continued to be directed at McNamara personally too. Sometimes, as he claims, it came from very close circles such as an incident of Jackie Kennedy's outburst at him. Despite such sentiments McNamara claims that public support for US intervention in Vietnam was strong and only 'students and misled youth' were protesting against the continuation of the war. He writes: "What disturbed me most during my campus visits was the realisation that opposition to the administration's Vietnam policy increased with the institution's prestige and the educational attainment of its students".

He further writes: "From early 1966 through mid-1967, public support for the administration's Vietnam policy remained surprisingly strong, despite rising US casualties and increasing media scrutiny of the war"; later, he quotes a columnist and writer on public opinion thus: "If there is a movement of opinion in the country it is toward seeking a military solution to what is generally regarded as a frustrating stalemate" (p 152). Everyone knows that western administrations rely much on media and public opinion surveys that are periodically carried out on key issues. However, no one, even at the highest level of administration, had failed to challenge the reliability or relevance of such surveys, where the information base was generally weak and knowledge of media persons on such matters was also questionable.

McNamara was in charge of actually running the Vietnam conflict. He alone had the unique and ultimate responsibility to inform

the president of his doubts or his opposition to continuing it. Why did McNamara abstain from counselling against the war that he now perceives as a 'doomed crusade'? Even his last important memo to the president on May 19, 1967 – one day before he lost his job as defence secretary – 'should have' recommended ending the war. But it did not. At that time he had no excuse. Now, in retrospect, he thinks he had the duty to help Kennedy and Johnson, not least because each was, after all, the president. It is here one cannot accept his pleas for 'understanding'. In other words, his loyalty to his masters was given priority; probably knowing it was wrong, he would do the same thing again! One can assume that he was reeling with power – previously he had held no government position and had no military experience when president Kennedy appointed him – or one can imagine he was just impetuous. Either way, there is no 'lesson' here. There is no solution to this problem of blind loyalty whether implied or imparted.

Post-war books can be broadly classified into three groups. First, written by defence analysts who scrutinise the "military strengths and weaknesses alongside strategies adopted". Second, political personalities or journalists, who prefer to write a memoir and generally opt to "set the record straight" which may include a commentary on the political scene. Third, social science researchers who pay attention to pre- and post-war trauma faced by the people, and the nature of socio-political processes. McNamara's memoir does not fall into any of these categories. As we observed in this review, in sum, this book fails to "set the record straight", complicates basic issues of the war, provides some excuses whereas explanation to the events was expected, and lastly, pleads guilt 'in style'.

Vietnam war was fought by two nations who are geographically apart, profoundly differ in their respective levels of economic development, their culture and their philosophy. It is clear that the mistakes of the US administration in Vietnam reflect fundamental differences between two societies that leaders like McNamara never understood. In the end, it is obvious that US simply could not accept the fact that its global supremacy was challenged by a 'tiny Asian' nation, and consequently war was intensified despite numerous loss of men and resources.

The Vietnam war was the aftermath of Japan's traumatic impact upon Indochina after 1941, France's later effort to restore a depleted colonialism and America's decision to intervene to 'contain' the spread of communism. None of them adequately understood the nationalist spirit of Vietnamese. It was this overriding context that caused the major events in Vietnam after 1943, including its immense sacrifices, and effectively challenge three of the world's superpowers. It is sometimes said that the post-cold war world will be so different from the world of the past that the

lessons of Vietnam will be inapplicable or of no relevance to the 21st century. It is not so. At least three points quoted as lessons by McNamara remain relevant even today which are: "(1) We misjudged them – as we have since – the geopolitical intentions of our adversaries, and we exaggerated the dangers to the US of their actions; (2) We viewed the people and the leaders of South Vietnam in terms of our own experience. We saw in them a thirst for – and a determination to fight for – freedom and democracy. We totally misjudged the political forces within the country; and (3) We failed then – as we have since – to recognise the limitations of modern, high-technology military equipment, forces, and doctrine in confronting unconventional, highly motivated people's movements. We failed as well to adapt our military tactics to the task of winning the hearts and minds of people from a totally different culture" (pp 321-23).

These are lessons to the US administration which constantly throttle many developing nations on issues such as democracy or human rights, still bombing Serbs' hopefully expect them to come over to the negotiating table. More than this key message, there is no new lesson one can gain from this book.

Vietnam, after all, was a war that changed America more than any event in the last century, even ignoring the deaths and problems in Vietnam and across south-east Asia and the world. Cambodia and Laos, the two neighbouring nations, generally referred to as a 'sideshow' to the Vietnam war, had been almost obliterated, with hundreds of thousands dead in the intervening processes. Available evidence provides a horrifying testament to the destruction of small, neutral nations through the violent and corrupt outlook of superpower policy-makers. McNamara is also deceptively silent on the sufferings of Cambodia and Laos.

For 30 years the world had asked Robert McNamara what he had to say about the Vietnam war and his role in it. With this book that wait was over. For McNamara the spread of the fighting and of US bombing are not matters to be discussed; the flood of peasants off the land, fleeing the warfare and then the growing cruelty is not relevant. He has no interest in the collapse of the society in Indochina. Indeed, *In Retrospect* illustrates more forcefully and more conclusively than any of his critics could do that for McNamara Vietnam was a stepping stone in his long career, its people expendable in the great game of large nations. Then there is little doubt McNamara now suffers anguish, although of course he lacks no creature comforts in his declining years. He will die as he lived for more than 30 years – wealthy, pampered, and cared for. Whereas US continues to engage in fallacious military interventions in many parts of the world, and still Vietnam, Cambodia, and Laos suffer from the legacy of that unjust war.

A five-year Bond of confidence.

**Annualized yield, computed @16% p a payable half yearly*

***Under the Indian Trusts Act, the Bombay Public Trusts Act and the Rajasthan Public Trusts Act*

PUBLIC ISSUE OF 10,00,000 16% UNSECURED, REDEEMABLE BONDS IN THE NATURE OF PROMISSORY NOTES OF RS. 5000/- EACH FOR CASH AT PAR AGGREGATING RS. 500 CRORE WITH A RIGHT TO RETAIN OVERSUBSCRIPTION UP TO RS. 500 CRORE (IN ALL RS. 1000 CRORE)

HIGHLIGHTS

- One of the premier all-India development finance institutions in the country
- Assisted over 4 800 companies in various forms for over 12,800 projects involving total disbursements of over Rs 34000 crore
- Uninterrupted dividend payments since 1956 (i.e. from the second year of operations)
- Professional Management: Board of Directors comprises personalities having vast experience in various fields
- Terms of the Issue
Face Value Rs 5000/-

Interest 16 % p a payable half-yearly

Maturity 5 years

- Bond is transferable by endorsement and delivery
- Listing on the Bombay Stock Exchange (BSE) and the National Stock Exchange (NSE)

RISK FACTORS

The present issue of Bonds carries the following normal risks associated with the activities of a development finance institution

- **Project Failures:** Projects financed by the Company may encounter delays in implementation, overruns and, in some cases, failure as well

- 16.64% annualized yield.*
- "AAA" CRISIL rating.
- NRIs, OCBs and FIIs permitted to invest on repatriable basis (NRIs and OCBs also on non-repatriable basis).
- "Public/Approved Security" status.**

Section 80L benefit available.

THE INDUSTRIAL CREDIT AND
INVESTMENT CORPORATION
OF INDIA LIMITED

Regd. Office: 163, Backbay Reclamation,
Bombay 400 020. Fax 204 6582.

Issue Closes on December 23, 1995.

Interest Rate Risk: Maturity mismatches between interest rate-sensitive assets and liabilities may expose the Company to interest rate risk.

Competition for Business: As a result of the liberalization of the Indian financial sector the Company expects to face increasing competition.

Competition for Resources: Due to the non-availability of low-cost funds through Government-guaranteed bonds, the Company has to resort to raising funds from various commercial sources including the capital markets.

CREDIT RATING: CRISIL: AAA

Credit rating indicates highest safety with regard to timely payment of interest and principal.

Communalising the Nation-Space

Notes on Spatial Strategies of Hindutva

Satish Deshpande

In its attempt to understand the spatial strategies of hindutva this essay tries to answer questions such as 'What kinds of places has hindutva successfully transformed into heterotopias?' 'What specific strategies have enabled this success?' 'What kinds of contestation and struggle are these spatial ideologies involved in?' 'How do these ideologies overcome the refractory nature of the materials they deal with?' 'How can one begin to think of defensive and offensive counterstrategies?'

ONE can hardly dispute the fact that hindutva is among the most important sources of social change at work in India today. In this essay I make a preliminary attempt to explore the spatial aspects of this would be hegemonic ideology by identifying the different ways in which it seeks to redefine the nation-space, rearticulate the link between an imagined community and its territorial domain.

The argument can be summarised in four basic propositions. (1) Considered as an ideological project, hindutva has an identifiable spatial dimension in the form of a strategy designed to refashion the social space of the Indian nation. (2) Historically, hindutva has attempted mainly to essentialise the nation-space by re-sacralising it, thereby stressing its irreducible and exclusive affinity for Hindus alone. (3) The contemporary spatial strategies of hindutva may be said to be based on three specific ideological constructs (or heterotopias), namely the site, the locality and the route. (4) These strategies partly complement and partly contradict other contemporary ideologies (notably that of globalisation) so that the overall outcome of their complex interactions is difficult to determine.

The theoretical context for these propositions is summarised in Section I, after which they will be briefly elaborated in the following sections along with some preliminary evidence.

I

Nation, Space, and Nation-Space in Contemporary Social Theory

Perhaps it is only by coincidence that recent social theory has simultaneously rediscovered the concepts of space and nation. Even so, this seems to offer rich theoretical possibilities, especially because the manner and the context in which these concepts have been revived are particularly conducive for cross-cultivation. Contemporary social theory has begun to reconsider both space and nation in ways which attempt to transcend (or at least to sidestep) the traditional dichotomy between the material and the mental. Moreover, questions of power and domination have come to be highlighted in both contexts. The way is thus cleared for exploring the spatial

aspects of the nation – the imagined community considered as a nation-space – and the ways in which social groupings with hegemonic ambitions attempt to reshape and appropriate this space.

Theorists of nationalism have long recognised that a claim to an identifiable territory is a necessary, though not a sufficient condition for the emergence of a strong sense of nation-ness. And though it has also been known that such a physical territory also functions at a meta-physical level as a collective representation, it is only recently that the full implications of these insights have become visible. This is in large measure due to 'the reassertion of space in critical social theory' through the claim that space is not 'natural' but socially produced.¹

Thus, contemporary social theory reminds us that nations inhabit a space that is simultaneously abstract (imagined, mental) and concrete (physical, geographical). These contrary aspects of the nation-space can be linked because of their common existence in, and only in, the social realm. However, it is only when this potential for linkage is realised through active social practices and processes that the nation-space can take shape. Nations are emergent phenomena; they become visible only when, in ideological terrain and an identifiable territory, can be cross-mapped onto each other to produce a sense of nation-ness shared by large numbers in society. Even after it has been successfully produced, the sense of nation-ness remains vulnerable to history and must be continually nurtured, partly through efforts to ensure that ideology and geography do not get out of synch.

However, contemporary social theory also tells us that both space and nation are implicated in power relations. The production of a sense of nation-ness clearly involves ideological and material contests. In a colonial context, this includes both the dimension of nationalism as anti-imperialism, as well as the more complex internal contestations among different possible nationalisms, each with its own equations vis-à-vis various regions, classes or ethnic groups within the proto-nation. The idea of the nation can thus be suitably inflected to facilitate its use as a

weapon in a broader social struggle for hegemony. Similarly, it is now recognised that social space is not merely an arena in which power relations 'happen' but also one of the means with which power is sought to be exercised. This is what gives meaning to the notion of spatial strategies.

A spatial strategy not only unfolds in space, it is also often about space – its appropriation, deployment or control. Such strategies are among those designed to support and maintain relations of power or of resistance. Considered as ideologies, spatial strategies can be seen as articulating the physical-material and mental-imaginative aspects of social space. In short, successful spatial strategies are able to link, in a durable and ideologically credible way, abstract (imagined) spaces to concrete (physical) places.

SPATIAL STRATEGIES AND IDEOLOGICAL SUBJECTS

In one of his unpublished lectures, Michel Foucault offered some suggestive comments which, despite being fragmentary and inadequate, may be a useful starting point for theorising the ideological practices that link abstract spaces to concrete places in politically productive ways.² Foucault took as his point of departure the assertion that we live not in a homogeneous and empty space³ but, on the contrary, inside a set of relations that delineates sites which are irreducible to one another⁴ [Foucault 1986: 23]. In the process of justifying this assertion, he identified two kinds of sites that are crucial: 'utopias' and 'heterotopias'.

Utopias are "sites with no place" or "fundamentally unreal spaces" (1986: 24). They are, in terms of the previous discussion, abstract spaces with no immediate or necessary reference to any concrete place. They may represent 'society itself in a perfected form' or else 'society turned upside down', but their relationship to concrete, physical places is indeterminate – they point to no particular place or to all possible places without any discrimination. In short, utopias are universalised, abstract spaces that are not marked as referring to any particular place.

Heterotopias, on the other hand, are 'real places – places that do exist' that can be

pointed out on a map, lived in, visited or, in general, empirically experienced in an obvious fashion. But heterotopias are very special kinds of places because (and here I depart from Foucault's formulation) they mediate in a mirror-like fashion between utopias and ideological subjects. In other words, heterotopias enable – incite, compel, invite – people to see themselves reflected in some utopia. They are places which function as an ideological hinge, linking social subjects (people) with a possible political, moral identity (utopia) that they could assume (inhabit).¹

However, though heterotopias are real physical places, they are not products of 'nature'. Considerable ideological labour is necessary in order to transform a given concrete site into a heterotopia. It is true that different places, by virtue of their particular history, physical attributes or geographical location, are more or less suitable raw material for producing a heterotopia. Thus, the unique natural properties of a place do help and may sometimes be a necessary ingredient, but they are never sufficient, always requiring additional efforts that consciously seek to transform a mere place into a culturally meaningful, politically charged space.

One way of understanding spatial strategies is to think of them as ideological practices involved in the construction of heterotopias. In this sense, spatial strategies attempt to tie an imagined space to a real place in such a way that these ties also bind people to particular identities and to the political/practical consequences that they entail.

A concrete example may help, and there can be few better than Ayodhya, the small town in eastern Uttar Pradesh that is also among the most potent heterotopias in our recent history. Hardly an unreal place, Ayodhya has nevertheless acted as a mirror opening into the imagined space – the utopia – of Ramrajya, hindutva, Hindu pride and so on. Seen from another angle, Ayodhya (or, more accurately, the Ram Janmabhoomi/Babri masjid) as a heterotopian site has offered thousands of people (particularly young Hindu males from urban and semi-urban middle class backgrounds) a social identity as inhabitants of the utopia that it projects, namely, the identity of the 'kar-sevak'. The transformation of this rural small town from merely another geographically specific place into a heterotopia was the result of a conscious spatial strategy. There was nothing 'natural' about it.

Although historically, several other places have claimed the name, it seems reasonable to assume that this particular Ayodhya has always been roughly where it is today. It has been known for several centuries as the supposed birthplace of a mythological hero, who is also one of the principle deities in the pantheon of Hinduism. That a Hindu temple

was supposed to have been destroyed here by a general representing a Muslim king this too has been known for more than four-and-a-half centuries. Thus, the 'natural' endowments of Ayodhya as a particular physical place have been the same for quite some time, but its successful transformation into a heterotopia is a very recent occurrence. This transformation has been effected by a spatial strategy that has, firstly, strengthened the link between the concrete place and the abstract utopian space of hindutva, and, secondly, forged a bond between the utopia and the people for whom it provides a renewed sense of belonging, a bond in which the place as heterotopia acts as the glue. It has to be noted finally that the relationship between the strategy and the place is an instrumental one – the same ends may be pursued by a similar strategic use of other suitable places.

This essay is an attempt to understand the spatial strategies of hindutva that have had a significant impact on contemporary social and political life. It tries to answer questions such as the following: 'What kinds of places has hindutva successfully transformed into heterotopias?' 'What specific strategies have enabled this success?' 'How do these strategies deal with their rivals – what kinds of contestation and struggle are spatial ideologies involved in?' 'How do these ideologies overcome the refractory nature of the materials – both geographical and human – that they have to deal with?' 'How can one begin to think of defensive and offensive counterstrategies?'

II Hindutva and Emergence of Indian Nation-Space

It will be readily appreciated that in order to understand the specific spatial strategies of hindutva today, it is necessary to look into the historical context from which they have emerged.² From the perspective of this essay, the relevant historical context is that of the interaction among the spatial aspects of colonialism, nationalism and communalism, which was also the process through which India emerged as a nation-space.

The spatial strategies of nationalism involved the attempt to translate the facts of social geography into matters of faith, belief and ultimately received experience. These included conscious efforts to 'historicise' or to anthropomorphise nature, the most obvious manifestation of which is the figure of Mother India. Through insistent and widely disseminated patriotic songs and writings, the physical features of the subcontinent – mountains, rivers, oceans and regions – were transformed into a common national heritage over which every Indian, even if she/he had never seen that particular part of the country, was invited to feel a sense of proprietary pride.

Our national anthem, for example, is a typical nationalist device for converting geography into ideology.

However, crucially, such spatial strategies included those that explicitly or implicitly appealed to shared religious or communitarian sentiment. In other words, there was nothing inherent in nationalist spatial strategies that prevented their use by groups based on religious or regional identities. Indeed, there were areas in which religious groups, especially Hindus, were at a significant advantage, because they could build on the powerful base of sacred geographies. Given the absence of any national community that was supra- or non-religious, attempts to construct an imagined community had to fall back on whatever existed in living memory that could be used to help concretise this new and unfamiliar notion. Thus, even self-consciously non-communal nationalists could not afford to ignore the mnemonic aids and powerful long familiar metaphors offered by the popular sense of history and geography, a sense inevitably infected by religion.³

Moreover, the concept as well as the concrete political identity of nationalism was flexible enough to permit communalists to not only claim but also to sincerely believe that theirs was a truly nationalist rather than a sectarian group. Matters were further complicated by the late 19th century religious revivalism, especially within Hinduism, which attempted with partial success to yoke together modernist ideals (science, rationality, technology, progress) and a reformed religious spiritual creed that downplayed the more atavistic and contradictory aspects of religion (untouchability, the subordination of women, superstition or excessive ritualism). With the advent of this new, improved variety of religious identity, it did not seem so self-evident as it had before that one had to choose between religion and spirituality on the one hand and the ideals of modernism and science on the other.⁴ In the contest between communal and non-communal political formations, the burden of proof (to demonstrate moral or social superiority) was thus unequally distributed, usually falling more heavily on the secular type of grouping. It is in this context that we have to examine the complication of communalism in the process of emergence of the Indian nation-space.⁵

SPATIAL STRATEGIES IN SAVARKAR'S HINDUTVA

Hindutva is not a word but a history', declares Savarkar, at the beginning of his self-consciously ideological tract, even as he proceeds to show how this history is closely and crucially intertwined with a geography (p. 21f). He is very clear that the term which he did more than anyone else to popularise, and which is enjoying a major revival today – Hindutva or Hindu-ness – is not to be

confused with Hinduism, the latter being a 'sectarian' term, referring to the followers of the Hindu religion proper. Hindutva, on the other hand, includes members of other faiths (like Sikhism, Buddhism, or Jainism), though it cannot be accused of being overgenerous in this regard.

Savarkar invokes the etymology of the word 'Hindu' - derived from the Sanskrit 'Sindhu', the name of the river otherwise known as the Indus, and also the word for ocean. He recounts the process by which Aryan tribes from Central Asia came to settle in the Indus basin, and subsequently spread out into the entire sub-continent while managing to retain their sense of nation-ness and cultural identity, until

At last the great mission which the Sindhus had undertaken of founding a nation and a country, found and reached its geographical limit when the valorous Prince of Ayodhya made triumphant entry in Ceylon and actually brought the whole land from the Himalayas to the seas under one sovereign sway (pp 7-8).

This establishes the true geographical boundaries of the 'Sindhu' nation, from 'Atak to Cuttack', and from the 'Himalayas to the Cape' - or, more classically, from 'Sindhu to Sindhu', or 'river (Indus) to (the two) oceans'. Savarkar takes great pains to stress these boundaries, and especially the versatility of the sanctified word 'Sindhu'. 'The reason for this excessive concern for these boundaries soon becomes obvious when his criteria for determining hindutva are announced. These are stated as the three conditions of 'pitrabhoo', 'jati', and 'sanskriti'. The first insists that a 'Hindu' should be born within Hindustan and thus have a legitimate claim to this nation-space as the fatherland.¹⁰ The second makes it obligatory for a Hindu to inherit Hindu 'blood' through natural parents.¹¹ But the most crucial interpretive move is in the third criterion, namely, that of a shared culture or *sanskriti*. Savarkar very quickly shifts from the common meanings of culture to a very specific one, namely, allegiance to a particular sacred geography. Thus, the final and ultimately all-important criterion for being a Hindu is that one's 'punyabhoo' or holy land should coincide with the 'pitrabhoo' so carefully demarcated earlier.

Savarkar's essentially territorial test for defining a 'Hindu' is thus based on the claim to a sacred geography. Among the three criteria that he proposes, it is clear that 'punyabhoo' takes precedence over 'pitrabhoo' and 'jati'. In fact, it is easily demonstrated that the latter two criteria are neither necessary nor sufficient: the case of a hypothetical American who may become a Hindu (p 54) demonstrates that blood and fatherland are not essential; while the fate of the Christians and Muslims of India (p 72), who are excluded despite their fulfilment of both these criteria, shows that they are certainly not sufficient. Both these instances establish beyond doubt that the

criterion of 'punyabhoo' is both necessary and sufficient, making it in effect the only relevant condition. This conclusion is further reinforced (though it is not in any need of this) by the highly significant exceptions that Savarkar considers - the Sindhis, and emigrant Indians settled abroad. In the case of the former, textual interpretation is invoked to stress that both banks of the Indus are to be included within the borders of Hindustan, thereby conferring membership on the Sindhis. As for emigrants, they are to be considered Hindus no matter where they are because of their holy lands being in Hindustan.

Theorists of human territoriality have suggested that it consists of, and may be used as, three main things, a form of classification, a mode of communication, and a method of enforcing control [Sack 1986:21-26]. Savarkar's definition of Hindutva can be seen as a very successful model of territoriality that includes all three features. As a spatial form of classification, it divides all those living in the Indian subcontinent into two clear camps, those who possess Hindu-ness or Hindutva and those who do not; this classification is spatial because it is based on a geographical definition of the holy lands which are to be considered decisive. Hindutva can also function as a mode of communication since "it requires only a single marker or sign - the boundary", one moreover, which "combines direction in space and a statement about possession or exclusion" [Sack 1986:32]. In the case of Hindutva, this boundary also acts as the means for legitimising power over and control of the nation-space, given its social context of a period of turmoil towards the end of colonialism, when the question of the formation of autonomous states is being considered. The claims put forward by Savarkar amount to the argument that only those marked by Hindutva have the moral-political right to constitute the nation, since their secular and religious-cultural interests are presumed to refer to the same geographical space.¹²

Considered at a more general level, the basic spatial strategy behind Savarkar's notion of Hindutva has for its central theme the redefining of the nation-space as a sacred space: the claim that the nation is, and ought to be, formed in the shape of a *punyabhoo*, a holy land. This serves to invest a geographical space - the actual physical extent of the Indian nation with a religious essence (the unanalysable relation of sacredness) that "outsiders" can never experience or comprehend, and which forever and completely defines 'insiders'.

NEHRUVIAN NATION-SPACE

As recognised by many scholars, the mainstream of the Indian national movement led by the Congress included a broad spectrum

of tendencies that based themselves on implicit or explicit appeals to Hindu religion [Dumont 1980, Chandra 1984:47ff]. These ranged from the militantly communal stance of a Tilak or a Savarkar to the much more complex but nevertheless recognisably Hindu approach of Gandhi. Indeed, as Nehru notes in his autobiography, the explicitly secular tendency (as different from tendencies that believed in coalitional arrangements across communities, especially Hindu-Muslim unity) within the Congress was a relatively weak one, its main proponent being Nehru himself. Given these conditions, it is difficult to say what the specific course of our post-independence history would have been were it not for two decisive but contingent events.

The assassination of Mahatma Gandhi by Nathuram Godse, and the latter's links with the RSS provided the secular forces with a big stick with which to beat communalists. The stigma of being associated with the Mahatma's killer was so strong that it took more than a decade for the Hindu right to regain sufficient legitimacy to make a mark in national level politics. Similarly, the sudden death of Sardar Vallabhbhai Patel in 1950 left the communal right within the Congress leaderless, and paved the way for the emergence of Nehru as the undisputed leader of the party. Moreover, Nehru's vote-drawing abilities and charisma helped to personalise his power and enabled him to play a critical but also larger-than-life role in the immediate post-independence period.

The period from independence up to the mid-1960s - the 'Nehruvian era' - has to be understood in the light of these events. If this era is now seen as the golden age of secularism, this is mainly because of the successful 'regionalising' of communalism during this period. Nehru and his allies managed to take over the newly created 'national' public sphere - shaping it in their own image as the sphere of state-sponsored socialism, secularism and non-alignment. The strong currents of communalism within the broader Congress movement were thus relegated (at least for the time being) to a more peripheral existence in the regions, especially in the northern heartland and in the west. So, the 'golden age' of secularism did not mean that communal forces were non-existent or even defeated; rather, they had been repressed within the national public sphere and displaced to the regional public sphere.

If the nation-space in Savarkar's Hindutva was based on a sacred geography, the Nehruvian nation-space was shaped by an economic geography. Nehruvian secularism was not really well-thought out, but represented rather a negative category. Insofar as its positive ideals had not been indigenised enough and had their roots in the western model of a secular-modern nation, this conception of secularism could only exist in

the newly created national space. It did not strike roots at the regional level. This was in keeping with Nehru's essentially economic understanding of communalism. As Partha Chatterjee has shown (1986: 141-43; see also note 31), Nehru believed that the legal guarantee of equality of citizenship regardless of religion, caste, creed or other social attributes would render communalism obsolete. It was only the colonial state that, by refusing to guarantee these freedoms, was helping to keep communalism alive in order to play off one community against another. A national state would act to remedy this, and

[h]aving assured the protection of religion and culture etc. the major problems that were bound to come up were economic ones which had nothing to do with a person's religion. Class conflicts there might well be but not religious conflicts except insofar as religion itself represented some vested interest [Nehru 1946: 387, quoted in Chatterjee 1986: 141].

The Nehruvian era amply demonstrates the centrality of the economy for nationalism.¹³ The major spatial strategy of this era thus foregrounds the economy: the nation is figured primarily as an economic space. It is this economic geography that the post-independence generation has grown up with. Powerfully disseminated through schools and all the state media, the nation becomes a space of production, and is imagined via economic associations. Places are named, so to speak economically: Kodama is mica, Ankleshwar is petroleum, Rourkela is steel, Bhakra Nangal is power, Coimbatore is textiles, and so on. It was these sites of development – the celebrated dams and steel plants – that were the principal heterotopias fashioned by the Nehruvian regime. The citizens of the nation were invited to see themselves reflected in the mirror of technological progress and development, to identify themselves as fellow travellers on the journey towards this common goal.

When compared to the sacred geography of Hindutva, this spatial vision is remarkably inclusive – rather, it lacks the differentiating principles which would enable boundaries to be drawn. Given that the nation was visualised as a community of patriotic producers, the Nehruvian nation-space could identify as 'other' only the non-worker (i.e. the shirker) or the non-national – the major axis of exclusion was directed outward across the national borders.¹⁴ By contrast, Hindutva claimed a nation-space where the major axis of exclusion is turned inwards: it is the 'internal' others who arouse anxiety.

The other side of the inclusiveness of the Nehruvian nation-space was an elitism that operated in an universalistic (rather than particularistic) mode. The Nehruvian era created and privileged a Pan-Indian elite that could, by and large, afford to cut loose its

regional moorings. Not only did this elite seem to be 'placeless' – it also appeared to be caste-less and class-less – a truly secular modern elite. This elite spoke in the modernist idiom of secular nationalism, scientific technology, and economic development. By adopting this idiom, the elite was able to render invisible its own ascriptive marker. Thus, the fact that this modernist elite was almost exclusively upper caste and middle class, that it came from a very select cultural background and a specific set of regions – all this could become 'transparent' and thus be made to vanish. Consisting of the rising technocracy – the professional-managerial class, intellectuals and top bureaucrats – this was an elite which thought of itself in purely national terms, whose native habitat was the de-territorialised space called New Delhi. As Sudipta Kaviraj has sarcastically observed, one of the consequences of the Nehru era is the situation where "it seems that only those people who are unable to speak any Indian language are the real repositories of Indian nationalism" [Kaviraj 1990: 69].

The Chinese war marked the beginning of the end of the Nehruvian era, and the stress lines were very quickly exposed. The military debacle not only discredited Nehru as a statesman, it also made room for the return of the jingoistic rhetoric of the Hindu right that had characterised the partition era. The long simmering discontent among the displaced power brokers and regional elites came to the surface with Nehru's death, which also coincided with a break in the process of planned development brought about by war, drought and an economic crisis. Indira Gandhi could take control of the Congress only by splitting it, and her reign inevitably marked the advent of the era of electoral arithmetic based on vote banks and an implicit communal logic.

The inclusive spatial sense of Nehruvian developmentalism was overtaken by an anxiety about the vulnerability of the borders of the nation. At the same time, the privileged national sites of developmental projects and the like could no longer claim to be exclusively national. They had to negotiate with the more immediate and localised sense of social space in the form of several 'sons of the soil' movements (especially around public sector jobs), as well as movements projecting assertive regional identities that refused any longer to dissolve easily into the national. As the hegemony of Nehruvianism crumbled, the nation space became increasingly vulnerable to contestations, especially since neither the official notion of secularism nor the particular image of the national community associated with Nehru had strong local roots. As the dream of egalitarian economic development became more and more implausible, new ways of visualising the nation-space began to compete for control of the ideological high ground within civil society.

III

Contemporary Hindutva and its Heterotopias¹⁵

Perhaps the overall spatial character of hindutva is best described in terms of re-essentialisation or an attempt to reverse the spatial logic of Nehruvianism in order to return to Savarkar's vision of the nation-space. This means that hindutva tends to emphasise the particularity of social space, attempting to (re)invest it with a unique cultural specificity. This amounts to an aggressively pursued strategy for the 'Hinduisation' of India. Such a policy has sought (despite its significant unevenness) to reverse – or turn inside out – the Nehruvian nation-space. If Nehru claimed that dams and steel plants were the temples of modern India, hindutva stands him on his head and insists that temples are to contemporary (post-modern) India what steel plants and dams were modern (Nehruvian) India.

If communalism is to be understood as a process of competitive de-secularisation, Achin Vanaik has recently suggested [Vanaik 1993] that its socio-spatial dimension involves an effort to re-sacralise the nation-space. De-secularisation is directly dependent upon the strategic deployment of essentialism. It is in the name of religious essences – unanalysable, uncontested truths that are self-evident to the faithful – that the flattening effect of an even-handed secularism is denounced. Against this diabolical and debilitating anonymity, communalism asserts the privileges of non-negotiable, unique, different identities. Where the heterotopia of the steel plant or the hydroelectric project is primarily inclusive (it is unable or unwilling to accord much importance to cultural distinctions), hindutva's new heterotopias are primarily exclusive, designed to serve precisely as markers of irreducible cultural difference.

In a certain sense, hindutva may be seen as exploiting the ideological vulnerability of the 'placeless' universalism of the Nehruvian nation-space. More precisely, this vulnerability consisted in the failure to articulate the abstract space to more personalised concrete places: heterotopias like the steel plant could not also project a sufficiently intimate relationship with particular individuals. The overall strategy of the Hindu right today thus involves an effort to rekindle a personalised commitment to particular places that is nevertheless embedded within the abstract social space of hindutva. If the Nehruvian nation-space privileged the universal abstract space of secular-modern development, hindutva attempts to elevate as universal the particularised relationship of 'Hindus' to specific concrete places.

Why has hindutva rejuvenated itself during the 1980s and the 1990s in particular? Why

of the negative side of the explanation, as suggested in the previous section, is to be found in the erosion of the foundations of Nehruvianism. Perhaps one of the reasons on the positive side has to do with the creation and development of the communications network. Initially established as part of the Nehruvian scheme to spread the message of national development, radio and especially television have undergone radical changes in the decades since Nehru. The dramatic expansion of television broadcasting in the 1980s (with the 1982 Asian Games held in Delhi as the springboard) created for the first time in Indian history, a national network organised around a medium vastly more powerful than either print or radio.¹⁰

Frederik Barth has suggested that culturally defined groups, like ethnic or religious groups, also constitute a 'field of communication' [Barth 1969]. The expansion of television and especially the historic 'Ramayana' teleserial can be said to have achieved this for the Hindu right. Of course, there was nothing predetermined about this, in the sense that it was hardly a conspiracy. On the other hand, the specific consequences of this teleserial, which invited a vast hitherto un-addressed audience to enter into a particular sort of 'narrative contract' [Kaviraj 1992] cannot be exaggerated. In a very concrete sense, the religious teleserials of the 1980s prepared the ground for the hindutva movement, as its leaders have themselves acknowledged [Rajagopal 1994]. By constructing a new, potent and abstract social-space mediated by the television screen, they made concrete the possibility of reviving Savarkar's 'punyabhoo' model of the nation-space.

These rather cryptic assertions can be best clarified through a more concrete discussion of the specific spatial strategies of hindutva. There are at least three distinct kinds of heterotopias that hindutva has attempted to construct in our recent history, those centred on places, areas, and routes.

PLACES OF ESSENCE: SACRED SITES

The strategy based on the 'site' is most obviously exemplified by the campaign for the 'liberation' of Ram Janmabhoomi. This strategy involves struggles around/for a sacred spot that can be turned into an arena of contest with the 'other'.¹¹ The very 'unreasonableness' of essentialism becomes a weapon designed to humiliate the other in a game pre-designated to be zero-sum - if 'we' are to win, then 'they' must lose; if we do not win, then they will. The whole point is to seek sites of confrontation where faith meets faith in a fight to the finish. One cannot help feeling that the Janmabhoomi controversy (and the numberless Kashi and Mathura sites that are said to be 'waiting') emerged out of a search for an answer to the question, Where can a temple be built only by destroying

a mosque? Within the implacable logic of 'Mandir wahin banayenge', construction has always been subordinated to demolition. This is amply borne out by the present situation, where the campaigns to 'reclaim' mosques in Kashi and Mathura are being heated up while the programme to build the temple at the Babri masjid site in Ayodhya is allowed to go cold.

It is important to emphasise that though the strategy of the site is based on essences, there is nothing essential about the strategy itself: it can be replicated quite easily in other places. This is, of course, proved by the extension of the Ayodhya strategy to other temple towns. But a more important illustration is provided by the flag hoisting controversy at Hubli, which is apparently a secular-nationalist issue. In spatial-strategic terms, however, the logic is the same: the insistence on a particular site; the adamant refusal to negotiate; and the systematic setting up of a zero-sum structure. The Idgah Maidan at Hubli thus represents a transposition of the Ayodhya strategy into a different context, city rather than small town; a localised rather than a generalised urban middle class; south rather than north; a national rather than religious flavour to the issue. The interesting corollary to the issue is that it is muslim religious identity that is relentlessly highlighted while the hindu right tries to cloak itself in the secular colours of patriotism.

AREAS OF INTIMACY: LOCALITIES AND NEIGHBOURHOODS

Unlike the site-based strategy which involves an abstract, universal essence embedded in the site, the spatial strategy based on the 'neighbourhood' emphasises the everyday familiarity of the site in all its spatial concreteness. In other words, the status of Ayodhya as the birthplace of Ram is an abstract and universal one; it is equally sacred for all hindus - those who happen to reside in Ayodhya are not necessarily privileged over those living elsewhere. But the strategy based on the neighbourhood emphasises the intimate relationship of local residents (neighbours) to their surroundings: this strategy privileges those who actually live in the particular space that is to be turned into a heterotopia. The neighbourhood is redefined as a threatened space - a besieged haven - that must be protected against the 'other'. If the 'other' is present in close physical proximity, i.e. if the locality is a mixed hindu-non-hindu one, the threat can be very easily simulated; if the 'other' happens to be absent from the locality, it is nevertheless portrayed as a threatened idyll permanently in danger of invasion.

As is well known, hindu right wing organisations, especially the RSS, have traditionally based themselves on the social geography of the urban middle and lower

middle classes [Basu et al 1993]. And as Tanika Sarkar in her valuable study of the Rashtra Sevika Samiti has found, the women's wing of the RSS, even more than its male counterpart, emphasises the importance of low-key but unrelenting ideological work in the immediate social vicinity of its cadres: the intimate and intensely particular spaces of domesticity and the family [Sarkar 1991]. In keeping with this philosophy, the prominent ideologue and general secretary of the Bhartiya Janata Party, K N Govindacharya seems to be almost obsessed with the locality and neighbourhood as the proper sphere for political negotiation and action:

We need to have more and more interaction, in an open and cordial atmosphere, between all the people, Hindus and Muslims, residing in a particular locality. This dialogue must take place between the people of the locality themselves directly, not through the self-proclaimed political leaders of one community or the other...

It is at that level that the question of how to live together while respecting the sentiments of others can be meaningfully discussed. *It is at that level* that ways may be found to get over the current competitive assertions of religion, resulting in the Namaz spilling over on the streets, and the Maha-aartis coming up in reaction. A dialogue at the level of the neighbourhood and the district alone can provide solutions to such problems. Only by thinking together at the neighbourhood and the local levels shall we learn to think in unison, as component parts of the whole Indian nation [Govindacharya 1993:22; emphasis added].¹²

The significance of the locality as a heterotopia is not only in terms of what it is able to achieve within its own spatial limits, but rather in the possibilities it creates for inserting such localities into a larger grid of ideological dissemination and political action. Thus, the neighbourhood acts as a sort of modular unit which, though it is crucially dependent on its particular location in social space, can nevertheless provide the ideological context for the production and reproduction of world views as well as properly indoctrinated workers for the hindutva cause. Especially when considered in conjunction with the other two kinds of heterotopias, namely the site and the route, these localities and neighbourhoods are the locations which help make the other two strategies possible. It is localities and neighbourhoods which supply the holy bricks, and the kar sevaks that are then transported to a particular site; they are also the points along the route of a procession or yatra.

ROUTES OF SYNERGY: PROCESSIONS AND PILGRIMAGES

Finally, the strategy based on the model of the 'pilgrimage' attempts to string together and multiply the effect of many particular places by joining them into the 'route' of a

goal-directed journey. This 'dotted line effect' gets the best of two worlds. Each 'dot' along the way remains a small town and yet can participate in something on a 'national' scale. Thus, it takes advantage of the strong sense of involvement and experiential energy that can be generated in a localised setting, but without sacrificing the ideological economies of scale. Most obviously visible in the various yatras undertaken by BJP leaders – Advani's rath yatra, Joshi's Kanyakumari to Kashmir yatra and more recently the 'jana aadesh' yatra from four different corners of the country. The concept of a yatra enables the invocation of a certain spatial sense of the power and persuasive sweep of an ideology. While this particular tactic is hardly new in Indian politics, the Sangh Parivar has been its most effective exponent in recent times.

One can also add to this the role played by processions in mobilising communal support in urban centres and small towns. The case of the Ganesh Utsav in Hyderabad is a well known example of exploiting the dynamic properties of the procession in creating powerful synergies of an oppositional nature. Processions of this kind simultaneously achieve the ends of uniting one's own side as well as the antagonists, thus ensuring in an almost automatic fashion, the success of political mobilisation [Naidu 1992]. In terms of the kind of people who are needed to create and to sustain such mobile heterotopias, this strategy is a mix of the previous two in that both locals as well as outsiders can be involved in making a yatra or a procession successful.

What it means to characterise the spatial aspects of hindutva as being based on the primacy of the particular should now be somewhat clearer. Each of the strategies outlined above seeks to create particular kinds of heterotopias – spaces which function as ideological mirrors to allow particular political subjects to recognise themselves in the identity that they seem to offer. Such heterotopias are generally dependent on the invocation of particular places – specific physically identifiable sacred spots, localities or neighbourhoods – and dots along the route to a goal. Despite this, however, hindutva manages to reap the economies of ideological scale by leveraging these heterotopias to obtain a larger-than-additive synergistic effect.

IV

Contrary Tendencies and Preliminary Prognoses

The above discussion of the spatial strategies of hindutva no doubt seems too neat and smooth because it has not taken account of the countervailing tendencies and the other extraneous forces which form the overall social context within which hindutva must operate. I will mention here only two of the significant

counter-tendencies at work within the broad rubric of hindutva and do little more than mention them.

The first, somewhat paradoxical case is that of the strategy of the site itself. The very success of this strategy, when coupled with the fact that an indefinite number of such sites is believed to exist, undermines the emphasis on particularity. One, two or a few sacred spots may depend on particularity, but when the number swells to a few thousand and nobody is either willing or able to put a specified limit to this number, then this strategy turns into its opposite.¹² There is little to distinguish it from the invocation of generalised (non-specific) spaces by (say) the rhetoric of globalisation.

The second, and perhaps more important example is that of what might be called 'non-resident hindutva'. The 1993 meet held in Washington (called 'Global Vision 2000') by the VHP provides an obvious instance where two versions of hindutva, one asserting the 'portability' and the other the immovability of its essence, collide. To say that they collide may already be an exaggeration today, when the globalised world is witness to more and more such ongoing negotiations between the local and the globalised faces of ethnicity [Appadurai 1991, Anderson 1992].

GLOBALISATION AND HINDUTVA

Among the most powerful competitors of hindutva for the status of major engine of contemporary social change is 'globalisation'. Broadly speaking, globalisation appears to pursue the contrary tendency: it tends to undermine the particularity of places and to subordinate them to a universalised logic. Every specific place is compared to – or commensurated with – a global norm. Edward Said has named the orientalist version of this levelling process as 'moral commensuration'. This is a process whereby 'western metropolitan places come to have a kind of export value: whatever is good or bad about place at home is shipped out and assigned comparable virtue or vice abroad' [Said 1993: 79]. One can, I think, conceive of a contemporary equivalent for globalisation where the movement is usually (but not always) in the reverse direction: non-western (third world) places are compared to some western norm place, and valorised, or given a modified ideological meaning, through this comparison.¹³ In effect, this kind of moral commensuration 'equalises' places and seeks to underplay differences rather than to accentuate them.

More generally, theoretical prognoses of the development of capitalism from Marx onwards have pointed to the universalising tendencies of capital. In spatial terms, this expresses itself in the process of de-territorialisation, that is, the uprooting and

enforced portability of all forms of social life that capital takes hold of. Anthony Giddens has suggested an awkward but accurate phrase to summarise this aspect of the impact of globalisation – the disembedding of social relations. This is the process rendered familiar by the literature on the restructuring of capital – flexible accumulation and 'post-Fordism'. Industries turn nomadic in the search for the most profitable location, production processes are broken up and subcontracted globally, innovations in telecommunications enable certain industries (like computer software) to engage in 'space-less' production, without a single specific spatial location in the conventional sense. (Satellite links enable software engineers located in far-flung corners of the globe to participate simultaneously in production, while the product itself exists only in the cyberspace of electronic storage devices.) The basic outcome of such a conquest of space is a profound indifference towards its specificities. Thus, the spatial consequences of the economic logic of contemporary capitalism include the dilution of nation-specific production into a more anonymous globalised process [Deshpande 1993b].

However, recent research has also demonstrated that the alleged conquest of space is far from complete and is in any case a rather uneven and contradictory process. These researches build on the insight reported more than two decades ago by Deleuze and Guattari:

Civilised modern societies are defined by processes of decoding and deterritorialisation. But what they deterritorialise with one hand they reterritorialise with the other. [Deleuze and Guattari 1977: 25]. (original emphasis)

The process of reterritorialisation that accompanies deterritorialisation takes many forms, but two are especially common. First, there is the simple refusal of archaic territorial entities to go away, and indeed an increase in their mass appeal. An excellent example is the nation, which, in defiance of marxist (and non marxist) economic expectations regarding the erosion of national identities, continues to command the often fanatical loyalty of large numbers. The second more complex form of reterritorialisation can be considered to be an integral part of the process of globalisation itself, namely the cultivation and deepening of spatial specificity, but within a framework where this is subordinated to the overall logic of globalisation. An obvious example here is the tourism industry, which fosters and even invents specificity as 'authentic exoticism', but only in order to offer these exotica in a domesticated, pre-packaged form to the global consumers of cultural difference or affluent tourists.¹⁴

This latter tendency has occupied the attention of social researchers trying to account for the striking fact that globalisation is

accompanied by the growth of particularistic cultural identities of all kinds. Across the globe today, what may be termed 'essentialist' cultural identities – based on religion, ethnicity, nationality, language, or region – are enjoying an unprecedented revival even as the processes of globalisation are simultaneously intensified. It has been tempting, therefore, to speculate on a possible causal link between the two processes, leading to the broad thesis that globalisation produces a sort of 'identity anxiety' that individuals and groups seek to redress through the reassertion of particularistic identities. Economic globalism produces – indeed, even requires – cultural parochialism as its own antidote and precondition. Religion is particularly relevant in this context, as demonstrated by the remarkable revitalisation of Catholic, Protestant, Jewish, Islamic, Hindu and Buddhist fundamentalisms of various kinds in widely differing local milieux [Beyer 1990].

Returning then, to the basic theme of this essay, it is more than plausible to theorise the contemporary rise of hindutva as a more or less necessary byproduct of the process of globalisation. At the same time (as I have tried to argue above), the two are also mutually contradictory. It seems difficult in such a context to hazard guesses about the future. However, it may be useful to keep in mind these two sets of relations – the one complementary and the other contradictory – rather than any unidimensional conception of their reciprocal involvement. Perhaps this is the limited insight that social theory can offer, even as we await, and try to work towards, the emergence of different, more enabling articulations of the two processes.

Notes

[This paper is part of an ongoing project on the relations among hindutva, globalisation, and conceptions of the Indian nation. Different parts and versions of this argument have been presented at the panel on 'Religion, Region and Nation' at the XXth AH India Sociological Conference, Mangalore, December 1993; at the international seminar on 'The Third World City: Emerging Scenarios' organised by the Centre for Area Studies, Osmania University, Hyderabad in February 1994, and the biannual Subaltern Studies Conference hosted by the International Centre for Ethnic Studies, Colombo in June 1995. Helpful comments from members of the audience at these venues are gratefully acknowledged.]

1 The phrase quoted forms the subtitle of Edward Soja's book (1989); some other works that treat social space in an innovative way include Lefebvre (1991), Boudieu (1984), De Certeau (1984), Tuan (1977), Sack (1986), and Harvey (1989).

2 For different perspectives on these and related issues, see, for example, Anderson (1991), Smith (1986) and Wallerstein and Balibar (1991).

3 The particular source from where I am borrowing is the translated text of the notes

which formed the basis of a lecture given by Foucault in 1967. This manuscript was "not reviewed for publication by the author and [is] thus not part of the official corpus of his work." I mention this only to underline the fact that this text does not carry the theoretical authority that other finished works might. Moreover, I am also taking considerable interpretive liberties with it.

4 Foucault's use of the mirror metaphor may be helpful in clarifying the relationship between the utopia and the heterotopia.

The mirror is, after all, a utopia, since it is a placeless place. In the mirror, I see myself there where I am not, in an unreal, virtual space that opens up behind the surface. But it is also a heterotopia insofar as the mirror does exist in reality, where it exerts a sort of counteraction on the position that I occupy. ...[I]t makes this place that I occupy at the moment when I look at myself in the glass at once absolutely real, connected with all the space that surrounds it, and absolutely unreal, since in order to be perceived it has to pass through this virtual point which is over there [Foucault 1986:24].

5 To say this, however, is not to assume an unbroken continuity with the past, nor to insist on a discontinuous present. Rather, such an attentiveness to the "history of the present" is indispensable when the object of enquiry is ideological, since no ideology ever starts with a clean slate but selectively builds on (or dismantles) already existing formations. Even completely new elements take on their meaning and produce their effects only in conjunction and/or juxtaposition with older elements.

6 Jawaharlal Nehru is a good example, as several passages from his *Autobiography* or *The Discovery of India* attest.

7 Partha Chatterjee's well known account, for example, constructs the 'moment of departure' of Indian nationalist discourse in terms of the Bankim model: modern (western) science and technology plus traditional (Indian) dharma and culture [Chatterjee 1986].

8 I am deliberately avoiding an extended discussion of the various views on the nature and sources of communalism, and will provide only a minimalist working definition, for the purposes of this essay, communalism involves both (a) the pursuit of political goals through the open or hidden appeal to religious sentiment and/or identities; and (b) the exploitation of this sentiment to exclude other religious groups and to cultivate hostility towards them. Let me also make it clear that though I will discuss only Hindu communalism, this should not be taken to imply that I believe it to be the only kind existing. Finally, because it offers so striking an instance of a conscious spatial strategy, I am restricting myself here to a single work by a single author, 'Swatantraya Veer' V D Savarkar and his pamphlet, *Hindutva*. This pamphlet is contained in volume VI ('Hindu Rashtra Darshan') of the *Sampurna Savarkar Wangmaya*, the collected works of Savarkar, published (and partially translated into English from the Marathi) by the Maharashtra Prantik Hindu Sabha in 1964. Unless otherwise specified,

all subsequent quotations and page references are from the English translation in this edition [Savarkar 1964].

9 "The word Sindhu in Sanskrit does not only mean the Indus but also the sea – samudrarashna which girdles the southern peninsula – so that this one word Sindhu points out almost all the frontiers of our land at a single stroke [Savarkar 1964:20].

10 It may be interesting – though this must be examined further keeping in mind the vagaries of translation and the semantic context of the Marathi original, something which I have been unable to do as yet – that Savarkar appears to consistently prefer the term 'fatherland' to 'motherland' despite the continued (though sporadic) mention of the latter word.

11 Unlike in the case of 'pitrabhoo' and 'matrabhoo', Savarkar seems to have used some interpretive licence here (and this is probably not a matter of translation) for he uses the word 'blood' to mean 'jati' usually translated as caste. His argument is that 'Hindus' are all of one caste and (therefore) of one blood because of the frequency of anuloma and pratiloma (i.e. inter-caste) marriages over the centuries and even millennia. It is interesting to compare Savarkar's criteria with Schneider's comments on the parallels between kinship by blood and marriage versus nationality by birth and naturalisation [Schneider 1976:215-16].

12 While this is something that needs to be taken up in greater detail as a separate discussion, it may be worthwhile to note in passing that these spatial strategies raise doubts about the viability of Partha Chatterjee's distinction between the 'inner' and the 'outer' realms. He has suggested that this distinction, and its transposition into the spiritual/material dichotomy, was the characteristic feature of Indian nationalism. This enabled Indian nationalist discourse to acknowledge the undeniable dominance of the west in the outer/material realm, while simultaneously reserving the inner/spiritual domain as its "sovereign territory" [Chatterjee 1993:6, emphasis added; see also Chatterjee 1986].

However, such an analysis cannot accommodate Savarkar's spatial strategies, which do not necessarily restrict the sphere of nationalism or spirituality to the 'inner' realm. Moreover, this directly contradicts important nationalist-communalist initiatives (which I have been unable to discuss here) like that of B G Tilak, who politicised the 'Ganesh Utsav' and transformed it from the household festival (which it traditionally was) into a public affair involving ten days of collective celebrations climaxed by an immersion procession [see Cohn (1987:125-26) for a brief discussion of Tilak, and Devji (1994) for a different view on the spatial dynamics of gender and Muslim religious identity in colonial India; see also Section III].

13 I have discussed this theme at length elsewhere; see Deshpande (1993a) for the centrality of the ideology of economic development for Indian nationalism.

14 See Deshpande (1993b) for an extended treatment of this and related themes concerning the principal ideological models of the economy in 20th century India.

15 Let me clarify at the outset that, unlike in the previous section where I was referring to

the term that Savarkar employed (which is why I had retained his capitalisation of 'Hindutva'), in this section I am using the lower-case term 'hindutva' in a contemporary and rather broad sense as an abbreviation for both the general ideology associated with, and the socio-political movement led by, the neo-Hindu right-wing grouping crystallised around the so-called 'Sangh parivar'. [Compare Basu et al (1993:1, fn), who use the term hindutva "not in the sense of Hinduism, but to indicate the contemporary communal organisations and movements that use this banner".] This is obviously an imprecise definition in that it does not recognise the many distinct (and sometimes contrary) tendencies contained within the same overall phenomenon. However, I believe that this rough definition (like that of communalism above) will suffice for the purposes of this essay, especially since the argument is still at an exploratory stage.

Moreover, when speaking of the overall spatial character and the particular spatial strategies adopted by 'hindutva', I am speaking of the ideological effects pertaining to social space that are being produced through the logic of hindutva as a socio-political force operating in the contemporary context. I do not mean to imply, when referring to these ideological effects, that they are necessarily intended or consciously strategised by identifiable individuals or groups – but I do not rule out this possibility either. In short, while the coherence of hindutva is to be sought in terms of effects rather than intentions, the co-presence of both is a matter for empirical investigation rather than theoretical prejudice.

6 For suggestive discussions of this crucial episode in the cultural-politics of contemporary India, see Rajadhyaksha (1990) and Rajagopal (1993).

7 Arvind Rajagopal has suggested that the theme of a birthplace has special spatial and psychological significance: "There is a promise here of regaining a primordial oneness with the self, of reconciling the divisions within the self in the unity of the self-evident location" [Rajagopal 1994:1662].

8 Unfortunately, I have as yet been unable to gain access to a copy of Govindacharya's book and so have relied on extensive extracts published in *Blitz* magazine of December 3, 1993, as an anniversary issue commemorating the destruction of the Babri masjid. These quotations are from this extract.

9 Vishwa Hindu Parishad and other like-minded organisations have often claimed such figures – sometimes in the thousands – of allegedly desecrated Hindu temples awaiting 'liberation'.

10 As an example, one can cite a well known series of advertisements for the Tata group of companies which is built around the strategy of comparing places and things Indian to their global counterparts: Bombay is compared to Beijing or New York, an Indian steel plant is compared to a German one, and so on. This is the opposite of the essentialisation that is an integral part of the spatial strategy of hindutva.

11 For an overview of this literature, see Harvey (1989), especially part II, Chapters 7–11. 'The political-economic transformation of late 20th century capitalism'.

22 It is, of course, one of the better known ironies of the late 20th century that it is precisely in the former socialist states that parochial nationalism has taken its most virulent form. One must remember, however, that the *Communist Manifesto* acknowledges (by implication) the longevity of the nation-form when it visualises each national working class tackling its own bourgeoisie, before it is possible for the workers of the world to unite. See also Anderson (1992) for a brief discussion of some of the contradictory tendencies fostered by globalisation.

23 For a rich variety of perspectives on this set of issues, see the articles in the volume edited by Mike Featherstone (1990), especially those by Robertson, Wallerstein, Smith, Arnason, Hannerz, Appadurai, and Beyer.

Industrialisation, Liberalisation and Two Way Flows of Foreign Direct Investments

Case of India

Nagesh Kumar

The Indian government's attitude towards foreign investments has evolved over the post-independence period in four distinct phases. The period from independence up to the late 1960s was marked by a gradual liberalisation of attitude. The period from the late 1960s through to the 1970s was characterised by a more selective stance. The 1980s were marked by a certain liberalisation of policy. In 1991 India liberalised its policy regime further with respect to both inward and outward FDI as a part of reforms undertaken to increase the international competitiveness of Indian enterprises. This paper analyses the evolution of India's FDI position in these four phases of government policy and levels of industrialisation and development.

INTRODUCTION

AT the time of its independence in 1947 India was a host to a significant stock of foreign direct investment (FDI) largely owed to her erstwhile colonial master the UK. Soon after the independence, India embarked on a strategy of industrialisation with active governmental intervention. Domestic enterprises accumulated considerable capability in the process of industrialisation which has influenced not only the pattern of inward FDI in the country in subsequent period but has also led to investments made by Indian enterprises abroad. The changes in government policy have also had an important bearing on the FDI position of India. The Indian government's attitude towards foreign investments has evolved over the post independence period in four distinct phases. The period from independence up to the late 1960s was marked by a gradual liberalisation of attitude. The period from the late 1960s through to the 1970s was characterised by a more selective stance. The 1980s were marked by a certain liberalisation of policy. In 1991 India liberalised its policy regime further with respect to both inward and outward FDI as a part of reforms undertaken to increase the international competitiveness of Indian enterprises.

This paper analyses the evolution of India's FDI position in these four phases of government policy and levels of industrialisation and development. The theory posits that the pattern of a country's FDI both inward and outward changes with the structural transformation of the economy [Dunning 1981, 1994; Ozawa 1992]. This is because the structural transformation affects the competitive advantages of foreign investors relative to those of local firms (ownership or 'O' advantages), relative competitiveness of location bound resources and capability of the country (locational or 'L' advantages) and the propensity of foreign and local firms to utilise the ownership advantages internally rather than through

market (internalisation or 'I' advantages). With country's development and government interventions the configuration of these advantages changes which gets reflected on the FDI position of the country. A country's FDI position is expected to evolve through a sequence of four or five stages according to Dunning's investment development path (IDP) theory.

The first stage is characterised by low levels of development and underdeveloped infrastructure. In this stage the little inward FDI that the country receives is concentrated in extractive or primary resources because L advantages are insufficient. There is hardly any outward FDI because O advantages of domestic enterprises have not been developed. Government intervention in this stage focuses on building up infrastructure and development of human resources. In the stage two, development of local markets and other L advantages in the form of protection of local industry brings in import substituting manufacturing FDI. Domestic enterprises develop some O advantages as they accumulate certain technological capability in the process of production using and adapting technologies available elsewhere. Government policies also encourage accumulation of technological capability. These O advantages would lead to outward FDI at this stage. The outward FDI is expected to be of market-seeking or trade related type made generally in neighbouring countries at a lower level of development in terms of O advantages. There may be some strategic asset-seeking investments in more advanced countries. In the third stage, both inward and outward FDI activity move towards a higher level of sophistication. The O advantages of domestic enterprises are strengthened and they acquire technological capability to produce standardised goods. On the one hand, this will erode the competitiveness of O advantages of foreign investors in standardised goods sectors. This coupled with rising incomes and wages, and enlarged market will direct inward FDI to more technology-intensive

manufacturing, generation of higher value added locally, and towards efficiency-seeking or export platform production. It will also lead to expansion of outward FDI by domestic enterprises. In the final stage the accumulation of acquired assets by domestic enterprises reaches a level that outward FDI flows are evenly balanced with the inward FDI flows.

In Ozawa's scheme the four stages of development of FDI position of a country are respectively factor driven, investment driven, innovation driven and wealth driven stages and roughly correspond to those of Dunning. It would be useful to keep these theoretical prepositions in the background for the analysis of this paper.

1948-67 CREATING LOCATIONAL ADVANTAGES WITH IMPORT PROTECTION

In the mid-1948 when the first survey of India's international assets and liabilities was undertaken by the Reserve Bank of India (RBI), the stock of foreign investment in the country stood at Rs 2,560 million, largely from India's erstwhile colonial master, the UK. The sectoral pattern of FDI was quite typical of stage one of IDP. The bulk of the FDI stock was of natural resource seeking and of trading type and had concentrated in raw materials, extractive, or service sectors. Tea plantations and jute accounted for a little over a quarter of total FDI which together contributed half of India's exports, about 32 per cent was in trading and other services, 9 per cent in petroleum, and only about 20 per cent in manufacturing other than jute [Kidron 1965: 3].

Soon after independence, India embarked on a strategy of import substituting industrialisation in the framework of development planning. With the Second Five-Year Plan which was launched in the mid-1950s, the Indian industrialisation strategy focused on development of local capability in heavy industries including the machinery manufacturing sector. The scope of import substitution extended literally to almost everything that could be manufactured in the

FIGURE 1 STOCK OF INWARD FDI IN INDIA

country [see Bhagwati and Desai 1970 for more details]. The domestic industry was accorded considerable protection in the form of high tariffs and quantitative restrictions on imports. In order to channel country's scarce investible resources (the savings rate was just over 10 per cent in 1950) according to Plan priorities, an industrial approval (licensing) system was put into place in the country that regulated all industrial investments beyond a certain minimum. A number of key industries were earmarked for further development in the public sector either in view of their strategic nature or anticipated lack of initiative in the private sector because of large capital requirements. As a part of the development plans large investments were made in human resources creating activities such as expansion of educational, especially the technical and engineering, facilities and creation of a scientific and technological infrastructure in the form of a network of national and regional laboratories in the country. The government also made investments in development of institutional infrastructure for industrial development such as term lending and capital markets development. As the domestic base of 'created' assets viz technology skills, entrepreneurship was quite limited, the attitude towards FDI was increasingly receptive.

The foreign investment policy statement made by the prime minister in April 1949 considered foreign investment necessary in supplementing Indian capital and for securing 'scientific technical and industrial knowledge and capital equipment'. It was, therefore, encouraged on mutually advantageous terms though the majority local ownership was preferred. Foreign investors were assured of no restrictions on the remittances of profits and dividends, fair compensation in the event of acquisition and were promised a 'national treatment'. The foreign exchange crisis of 1957-58 led to further liberalisation in the

government's attitude towards FDI. In a bid to attract foreign investment to finance foreign exchange component of projects, a host of incentives and concessions were extended. The Indian investment centre, with offices in major investor countries, was set up in 1961 to promote foreign investments in India. Anticipating the foreign exchange bottleneck to continue and affect the Third Five Year Plan projects, the government issued a list of industries in 1961 taking into account the gaps in capacity in relation to plan targets where foreign investments were to be welcomed. These included some of the industries earlier reserved for the public sector such as drugs, aluminium, heavy electrical equipment, fertilisers, synthetic rubber.

Inward FDI The protection accorded to local manufacture acted as an important locational advantage encouraging market seeking FDI. A large number of foreign enterprises serving Indian market through exports started establishing manufacturing affiliates in the country. This - late 1950s and early 1960s - was the period when western multinational enterprises started showing real interest in India. In the early 1950s their response was only lukewarm except in the case of one-shot investment in oil refineries [Kidron 1965: 102, 157]. Most foreign drug companies exporting to India also set up their manufacturing subsidiaries in India during this period. Between 1948 and 1964 the FDI stock in the country more than doubled to Rs 5,655 million from 2,560 million (Table 1). Creation of locational advantages led to a sharp jump in the share of manufacturing in the FDI stock to over 40 per cent from around 20 per cent at the time of independence. Within manufacturing sector, consumer goods industries such as food and beverages (13.2 per cent), medicines and pharmaceutical (10.9 per cent), textile products (7.2 per cent), and intermediate and capital goods such as metal and metal products

(14.4 per cent), electrical goods (7.9 per cent), chemicals and allied products (16 per cent), machinery and machine tools (6.9 per cent) and transport equipment (6.5 per cent) accounted for bulk of FDI stock. As Indian enterprises had not accumulated adequate ownership advantages, outward FDI was negligible in the period.

To sum up the above discussion, India during this period was getting itself equipped with the locational ownership and internalisation advantages necessary to make a transition to stage two of the IDP.

1968-79: PROTECTING THE DOMESTIC BASE OF CREATED ASSETS

Investments made in machinery fabrication facilities, manpower development, scientific and technological infrastructure made in the previous period had led to development of certain 'created' assets in the country. For instance, certain capabilities for process and product adaptations had been built up in the country. A number of local design engineering and project management consultants had accumulated considerable expertise while acting as subcontractors for western prime consultants. A considerable plant fabrication capability had been built up in the country by late 1960s. The share of capital goods industry in industrial value added had increased from under 5 per cent in 1950 to nearly 25 per cent by 1970. The share of imported machinery and equipment as a proportion of gross domestic capital formation had gone down from 69 per cent in 1950 to under 25 per cent by 1968-69. However, locally available skills and capabilities were needing some sort of infant industry protection as these were not able to stand competition from more established industrialised country sources. Constraints on local supply of capital and entrepreneurship had begun to ease somewhat. On the other hand outflow on account of remittances of dividends, profits, royalties and technical fees etc. abroad on account of servicing of FDI and technology imports from the earlier period had grown sharply and had become a significant proportion of the foreign exchange account of the country.

All these factors together prompted the government to streamline the procedures for foreign collaboration approvals and adopt a more restrictive attitude toward FDI. A new agency called the Foreign Investment Board (FIB) was created within the government in 1968 to deal with all cases involving foreign investment or collaboration with up to 40 per cent foreign equity. Those with more than 40 per cent foreign ownership were to be screened by a Cabinet Committee. Restrictions were put on proposals of foreign direct investments unaccompanied by technology transfer. The government listed industries in which FDI was not considered

FIGURE 2 STOCK OF OUTWARD FDI IN INDIA

desirable in view of local capabilities. The permissible range of royalty payments and duration of technology transfer agreements with parent companies were also specified for different items. The guidelines evolved for foreign collaborations required exclusive use of Indian consultancy services wherever available. If foreign consultants were required, the Indian consultants had to be retained as prime consultants. Restrictions were imposed on renewals of foreign collaboration agreements. A new Patents Act was enacted in 1970 which abolished 'product' patents in foods, chemicals, and drugs and reduced the life of process patents from 16 to 7 years (14 years in other cases). From 1973 onwards the further activities of foreign companies (along with those of local large industrial houses) were restricted to a select group of core or high priority industries. In the same year a new Foreign Exchange

Regulation Act (FFRA) came into force which required all foreign companies operating in India as branches of companies incorporated abroad to register themselves as Indian companies with up to 40 per cent foreign equity. The Indian companies were also directed to dilute their foreign equity to a maximum of 40 per cent and exceptions were made only for companies operating in high priority or high technology sectors, tea plantations or those producing predominantly for exports. In 1976, a Technical Evaluation Committee with representation from various scientific agencies was set up to assist the FIB in screening foreign collaboration proposals. The committee was expected to provide a professional input into the decision whether foreign collaboration or FDI proposal under evaluation was justifiable on the grounds of bringing technology not available locally to the country.

The government policy encouraged outward investments by Indian companies as means of promoting exports of Indian capital goods, technology and consultancy services. A systematic treatment of overseas investments, however, started only since 1974 when an Interministerial Committee on Joint Ventures Abroad was created within the ministry of commerce to approve proposals from Indian companies. The guidelines for approval were formulated in 1978 which required the Indian participation to be in accordance with the host country regulations. The guidelines encouraged the joint venture form of operation with local enterprises and required that Indian equity participation be made by way of capitalisation of export of indigenous plant, machinery, capital goods and some times even know-how to the joint venture from India. In view of scarcity of capital resources in the country cash remittances of capital to overseas ventures were discouraged but could be allowed in exceptional cases.

The above policies for developing and protecting local expertise built up ownership advantages of local enterprises which in turn got reflected not only on the pattern of inward FDI but also led to significant outward FDI from India as will be seen below. This period marked the completion of India's transition to stage two of IDP.

Inward FDI The restrictions placed on FDI during the period led to a stagnation of FDI inflows. For instance, FDI stock increased between 1974 and 1980 by just Rs 163 million (Table 1). The increase in overall stock of FDI, however, tends to mask the reorganisation that took place in the pattern of FDI in the country during this period. One striking trend was liquidation of FDI stock

TABLE 1 SECTORAL DISTRIBUTION OF THE STOCK OF FDI IN INDIA

(Rs million)

in non-manufacturing sector largely due to take-overs by government of certain activities: of general insurance companies in 1971 and of petroleum sector between 1974 and 1976. On the other hand virtually all fresh inflows were directed to manufacturing sector. As a result the share of manufacturing in the FDI stock went up from 40.5 per cent in 1964 to 86.9 per cent in 1980. Within manufacturing sector, new inflows were directed to technology-intensive sectors such as electrical goods, machinery and machine tools, and chemical and allied products (in particular, chemicals, and medicines and pharmaceuticals). These three broad sectors accounted for nearly 58 per cent of total FDI in manufacturing in 1980 contrast to 41 per cent in 1964. The shares of metals and metal products, and transport equipment, showed a decline over the 1964-74 period, but have picked up during 1974-80. The rise in importance of technology-intensive products in the FDI stock has been at the expense of traditional consumer goods industries such as food and beverages, textile products and other chemical products.

As domestic enterprises accumulated their created ownership advantages, the interindustry pattern of shares of foreign enterprises (henceforth foreign shares) changed. Accumulation of local capability in certain industries diminished the competitive edge of foreign enterprises. We have elsewhere computed foreign shares in 54 Indian manufacturing industries in 1980-81 and examined changes over the preceding period [Kumar 1994a, chapter 2]. In certain branches the foreign shares declined because of increasing public sector participation, e.g.

non-ferrous basic metals, fertilisers, heavy organic chemicals, petrochemicals, basic drugs, heavy electrical and non-electrical machinery. In a number of sectors, e.g. jute and cotton textiles, paper, cement, edible and hydrogenated oils, etc., the foreign shares depleted because of loss of ownership advantages of foreign enterprises *vis-a-vis* local enterprises as the latter accumulated capability in these sectors. Foreign shares continued to remain high in a number of industries producing consumer goods sold under brand names, such as processed foods, cigarettes, toiletries, and leather goods. This could be explained in terms of continued dominance of their ownership advantages in the form of well known international brand names.

To gain further insights into the role of ownership, internalisation and locational advantages and policy factors influencing them, determinants of interindustry variation in foreign shares and intensity of licensing collaborations across 49 branches of Indian manufacturing industry were analysed in 1980-81 [see Kumar 1987a, 1994a: chapter 3, for more details]. The foreign share and licensing were regressed on intensity of industry in variables proxying different ownership and locational advantages. In tune with the hypotheses, the foreign shares were found to be concentrated in advertising and skill intensive industries. Licensing appeared a dominant mode in industries intensive in use of knowledge embodied in capital goods. Access to sources of capital did not appear to be a source of competitive edge for MNEs in Indian market as it was significant for neither FDI nor licensing. It was explained in terms of the fact of development of local

capital markets and term financing institutions in India. The intensity of local R and D was negatively related with foreign shares which was interpreted in terms of the preponderance of Indian R and D activity in the areas of relative less complexity and maturity. The government policy factors came up with expected results. Protection appeared to have served as a potent locational advantage favouring local production over market servicing by exports by MNEs. Consumer goods industries appeared to have lower concentration of foreign shares, other things remaining same, apparently because of entry regulations which discouraged FDI in industries where local capabilities were available. The high priority industries in industrial policy attracted both FDI and licensing.

Outward FDI: The import substituting industrialisation followed by India had created a reasonably diversified industrial base in the country with substantial machinery manufacturing capability by early 1970s. Considerable learning and technological capability accumulation had taken place in Indian enterprises as protection policies restricted technology imports. Indian enterprises learnt to do trouble shooting, adapt the processes and products imported originally from their western counterparts to Indian conditions, substitute imported raw materials by locally available ones, and made them more rugged to withstand frequent power failures [see Desai 1984; and Lall 1987, among others, for analyses of acquisition of technological capability by Indian enterprises]. Indian chemical and pharmaceutical enterprises developed indigenous processes for manufacture of

known chemical compounds and bulk drugs as product patents had been abolished. The increasing technological capability of Indian enterprises had got reflected in terms of rising Indian exports of manufactures in particular of chemical and engineering goods. The share of chemical and engineering goods in India's total exports nearly doubled from 7.9 per cent to 15.5 per cent over 1969-70 to 1980-81 [Kumar 1987b]. By the beginning of 1980s, India had emerged as a significant exporter among developing countries of capital goods including turnkey plants, consultancy services, licensing of know-how [Lall, 1982, 1983; Kumar 1987c]. The 1970s also marked the emergence of outward FDI by Indian enterprises in a significant manner. After taking off in early 1970s, the outward FDI grew at a faster pace in the second half of 1970s. According to Lall (1983) India had emerged as the third largest exporter of 'industrial' FDI among developing countries after Hong Kong and Singapore by about 1980. Therefore, Indian enterprises by mid 1970 had acquired 'created' ownership advantages in the form of technology adaptations, capital goods fabrication capability, human resources etc. that are prerequisites for outward investments. Bulk of Indian FDI during this period went

to developing countries in Africa, South-East Asia and South Asia. In these countries, the ethnic and cultural links of Indian enterprises also served as ownership advantages.

Table 2 provides the number and magnitude of investments made by Indian enterprises in their wholly owned subsidiaries and joint ventures made by the year of government approval on the basis of firmwise unpublished data collected from the Indian ministry of commerce. This data set include only those investments which are either in operation or are under implementation and exclude the abandoned ones. The latter is an important limitation in that it tends to underplay the scale of operations especially during the earlier period. The figures for more recent years can be expected to be closer to actual approvals as potential failures may not yet be apparent. Keeping in mind the above limitation of the data set available to us, it would appear that in the second half of 1970s the outward FDI from India showed a considerable growth. In a five-year period 64 new investments were made with a total Indian investment of Rs 581 million in contrast to just 36 ventures existing in 1975 with a cumulative investment of Rs 442 million. These figures tend to underestimate the scale of outward investment activity as the

abandoned ventures are not included as noted above and quite a few ventures set up during the period did fail.

It is clear from Table 2 that bulk of Indian FDI (80 per cent in number and 95 per cent in terms in value) made in the 1970s went to other developing countries. In fact much of Indian FDI was concentrated in Malaysia, Indonesia and Singapore within South-east Asia and Kenya (and Nigeria) in Africa, and Sri Lanka and Nepal in South Asia. Most of these countries were at a lower stage of development in terms of created ownership assets than India as predicted by IDP. Table 3 provides the industrial composition of Indian outward FDI. Bulk (73 per cent in value terms) of Indian FDI made during the 1970s were in the manufacturing sector. The most prominent branches of industry were light engineering, textiles and chemicals and pharmaceuticals. Among the service sectors, hotels and restaurants and consultancy were the most prominent.

It would appear from this pattern that Indian outward FDI made in this period was designed to exploit abroad the created assets of Indian enterprises in form of adapted, and sometimes scaled down, processes and products, human resources, equipment, fabrication capabilities etc. Hence these were

concentrated in countries at lower stage of IDP and in relatively lower technology requiring and maturing industries. In the case of India's inward FDI, the knowledge embodied in capital goods or machinery was found to be having low internalisation advantages as performance guarantees given by equipment manufacturers are usually adequate to take care of possible buyer's uncertainties. In the case of Indian enterprises operating abroad buyer's uncertainty may persist despite guarantees because of lack of an established reputation. The source of internalisation advantages could be the lack of entrepreneurship and absorptive capacity in the host countries to set up manufacturing projects based on technology and equipment imported from Indian enterprises on arm's length basis. Rajiv Lall [1986] in a survey of 17 Indian enterprises investing abroad conducted in the course of 1982 found the 'managerial and technical expertise as embodied in Indian personnel' deputed abroad to be the main source of competitive advantage of Indian enterprises. His quantitative analysis of the decision to invest abroad for a sample of 162 Indian enterprises including 24 foreign investors for the year 1977-79 revealed the firm size to be an important determinant of outward investment. Impediments to exports appeared to provide an incentive for outward FDI suggesting the market defensive nature of Indian investments. Dasgupta and Siddharthan [1985] and Agarwal [1985] found an interdependence between Indian exports and outward FDIs in the late 1970s and early 1980s and found them to be concentrated in sectors comprising largely standardised goods and with relatively low skill and technological content.

1980s: 'HALTING REFORMS' FOR IMPROVING INTERNATIONAL COMPETITIVENESS

Towards the end of the 1970s India's failure to step up significantly the volume and proportion of her manufactured exports in the background of the second oil price shock began to worry the policy-makers. It led to the realisation that international competitiveness of Indian goods had suffered from growing technological obsolescence and inferior product quality, limited range, and high cost which in turn were due to the highly protected local market. Another limiting factor for Indian manufactured exports lay in the fact that marketing channels in the industrialised countries were substantially dominated by MNEs. The government intended to deal with the situation by (i) putting emphasis on the modernisation of plants and equipment through liberalised imports of capital goods and technology, (ii) exposing the Indian industry to competition by gradually reducing the import restrictions and tariffs, and (iii) assigning a

greater role to MNEs in the promotion of manufactured exports by encouraging them to set up export-oriented units. This strategy was reflected in the policy pronouncements that were made in the 1980s. The industrial policy statement of 1980 and 1982, for instance, announced a liberalisation of industrial licensing (approval) rules, a host of incentives, and exemption from foreign equity restrictions under FERA to 100 per cent export-oriented units. It was decided to set up four more export processing zones (EPZ) in addition to the two existing ones, namely, those at Kandla (set up in 1965) and at Santacruz (set up in 1972) to attract MNEs to set up export-oriented units. The trade policies in this period gradually liberalised the imports of raw materials and capital goods by gradually expanding the list of items on the open general licence (OGL). Between 1984-85, 150 items and 200 types of capital goods were added to OGL list. Tariffs on imports of capital goods were also slashed. Imports of designs and drawings and capital goods were permitted under a liberalised technical development fund scheme.

The liberalisation of industrial and trade policies was accompanied by an increasingly receptive attitude towards FDIs and foreign licensing collaborations. Policy guidelines were issued to streamline the foreign collaboration approvals. The rules concerning payments of royalties and lump sum technical fees were also relaxed. Tax rates on royalties were reduced from 40 per cent to 30 per cent in 1986. A degree of flexibility was introduced in the policy concerning foreign equity participation, and exceptions from the general ceiling of 40 per cent on foreign equity were allowed on the merits of individual investment proposals. The approvals for opening liaison offices by foreign companies in India were liberalised and procedures for outward remittances of royalty, technical fees and dividends, etc., were streamlined. New procedures were introduced enabling direct application by a foreign investor even before choosing an Indian partner. A 'fast channel' was set up in 1988 for expediting clearances of FDI proposals from major investing

countries, viz. Japan, Germany, the US and the UK.

The focus of policies in this period, therefore, was on sharpening the international competitiveness of Indian enterprises by exposing them to increased domestic and international competition. Bhagwati [1993] has termed these policy changes as halting reforms because these were not comprehensive in their scope and did not go far enough to make a significant impact.

Inward FDI: The liberalisation of industrial, trade and foreign collaboration policies in the period improved investment climate and helped the country attract increasing inflows of FDI. The restrictions put on FDI imposed during the 1970s had virtually neutralised the internalisation incentives for potential foreign investors in the country. As a result of easing these restrictions, the stock of FDI nearly tripled over the decade of 1980s (Table 1 and Figure 1). The liberalisation also eased the near total restriction on FDI flows to technology intensive manufacturing and manufacturing's share in total FDI stock in 1990 actually declined slightly. The share of

services and plantations increased over the period. Among the branches of manufacturing food and beverages, machinery and machine tools, and transport equipment improved their share. The share of metal products and chemicals declined during this period. This period also witnessed further diversification of sources of FDI to the country with the emergence of Japan as the fourth largest source of FDI in India after UK, US, and Germany.

Outward FDI The initial enthusiasm shown by Indian enterprises in international operations in the late 1970s waned slightly in the early 1980s when the magnitude of FDI declined to 338 million from 581 million in the previous period although an equal number of investments were made (Table 2). In the second half of the 1980s, the overseas investment activity picked up again to 91 ventures abroad with a total Indian investment of Rs 2,030 million. Around the mid-1980s the geographical pattern of Indian FDI abroad had also registered a shift coinciding the increase in the magnitudes that took place. Till the mid-1980s India's FDI tended to concentrate in developing countries. Since then however the share of industrialised countries has gone up steadily. In the second half of 1980s, industrialised countries hosted 27 of the 91 Indian ventures with 21.6 per cent of investments. In continuation of the trend observed in the 1970s African countries were most prominent hosts of India's outward FDI in the early 1980s accounting for 62.22 per cent of all investments made during that period. South-east and South Asian, and West Asian countries accounted for much of the rest of India's FDI outflow. In the late 1980s, the Eastern and Central European countries which had been important markets for Indian exports emerged as important hosts of Indian FDI with 14 ventures accounting for 32.6 per cent of Indian FDI in the period. The South-east Asian countries hosted another 23 per cent of FDI of the period in 27 ventures. The West Asia was another region which attracted considerable (17 per cent) investment in the period. African countries received a negligible share of FDI in the late 1980s. Among the industrialised countries the US and Western Europe accounted for all the FDI made by Indian enterprises in the 1980s. Therefore, the geographical spread of Indian outward FDI expanded during the late 1980s with inclusion of countries at a higher stage of IDP than Indian, viz, industrialised countries, Eastern and Central European countries and some more South-east and East Asian countries.

The increasing geographical diversification of Indian FDI in the late 1980s coincided with sectoral diversification to cover more services and trading activities as compared to near total domination of manufacturing sector till the mid-1980s. This is because India's FDI

in countries more industrialised than herself has been of a different type than that in developing countries at a lower stage of IDP. The shift in terms of sectoral composition also came about in mid-1980s since when the share of manufacturing in total FDI outflow declined from nearly 75 per cent in the early 1980s to about 55 per cent in the late 1980s (Table 3). The fact that bulk (nearly 70 per cent) of FDI outflows to industrialised countries are in services and not in manufacturing is clear from Table 4 which shows the sectoral breakup of Indian FDI hosted by different regions. The share of services is also considerable in South-east and East Asian countries (46.13 per cent) a region constituting countries at a higher place in IDP than India. This is because the ownership advantages of Indian enterprises for overseas production which usually comprised the process or product adaptations, managerial and technical manpower and equipment fabrication facilities etc. which have been effective in countries at a lower stage of development fade before the ownership advantages of enterprises in industrialised countries and increasingly in the South-east and East Asian countries. Then what explains the growing Indian FDI in industrialised countries in services?

A significant proportion of service FDI were in trading which usually took the form of a subsidiary setup in major export markets of the firm to support the export activity. These subsidiaries are meant to create a marketing network in the markets and also serve as exporter's listening posts to get market information. As international competitiveness is increasingly determined by the non-price factors such as access to information and market presence, these investments can be seen as strategic investments made by Indian enterprises in improving their international competitiveness. Obviously such subsidiaries will be set up in major markets and those that are growing. Besides Indian enterprises have also developed ownership advantages in certain services that are intensive in use of human resources because of a vast pool of trained manpower available in India. These services include engineering and construction consultancy and software, finance, and hotels and restaurants.

Even within the manufacturing sector, there appears to be a shift in the focus of Indian enterprises in the 1980s. Chemical and pharmaceutical industry emerged in the first half of 1980s as the most important industry accounting for 47.8 per cent of all FDI. In the second half of the 1980s, chemical and pharmaceutical industry occupied the second place with 22 per cent of FDI after leather and rubber products with a slightly higher share. This reflects the increasing technological capability of Indian enterprises

in the chemical and pharmaceutical sector. A number of dynamic Indian chemical and pharmaceutical companies, eg, Ranbaxy, Lupin, Dr Reddy's Labs, have built up ownership advantages in the form of cheaper indigenous processes of production of off the patent bulk drugs, increasingly known brand names and cheaper formulation. In the ethical pharmaceutical sector market presence is an important factor for market penetration. This prompts Indian pharmaceutical enterprises to make outward investments in developing countries. The emergence of leather products sector in late 1980s is on account of a large leather project in Central Europe presumably to protect their market in former Soviet Union.

Therefore the decade of 1980s was marked by important changes in the policy regime existing in the country geared to improve the international competitiveness of Indian enterprises. The policy changes eased the restrictions on FDI inflows that were neutralising the internalisation advantages for most deals for transfer of technology between Indian and foreign enterprises. Increasing emphasis on international competitiveness made Indian enterprises to make strategic asset seeking type of investments in trading and other services in industrialised countries.

1990s: STRUCTURAL ADJUSTMENT AND GLOBALISATION

In the financial year 1990-91 India entered a period of severe balance of payments crisis and political uncertainty. A rapid increase in India's external debt coupled with the political uncertainty led international credit rating agencies to lower India's rating both for short and long-term borrowing. This made borrowing in international commercial markets difficult and also led to a outflow of foreign currency deposits kept in India by non-resident Indians. The situation was made worse by the Gulf war insofar as it led to rise in petroleum prices and caused virtual stoppage of remittances from Indian workers in the Gulf. These developments brought the country almost to the verge of default in respect of external payments liability which could only be averted by borrowing from IMF under standby arrangement and certain emergency measures taken by the government to restrict imports. In June 1991 a new government headed by P V Narasimha Rao came into power following the mid-term elections. This government initiated a programme of macro-economic stabilisation and structural adjustment supported by the IMF and the World Bank. As a part of this programme Indian rupee was devalued and a New Industrial Policy (NIP) was announced on July 24, 1991 in the parliament.

The NIP and subsequent policy amendments have liberalised the industrial

policy regime in the country especially as it applies to FDI beyond recognition. The industrial approval system in all industries has been abolished except for 18 strategic or environmentally sensitive industries. In 34 high priority industries FDI up to 51 per cent is approved automatically if certain norms are satisfied. FDI proposals do not necessarily have to be accompanied by technology transfer agreements. Trading companies engaged primarily in export activities are also allowed up to 51 per cent foreign equity. To attract MNEs in the energy sector 100 per cent foreign equity was permitted in the power generation. International companies were allowed to explore non-associated natural gas and develop gas fields including laying down pipelines and setting up liquefied petroleum gas projects. A new package for 100 per cent export-oriented projects and companies in export processing zones was announced. A foreign investment promotion board (FIPB) authorised to provide a single window clearance has been set up in the prime minister's office to invite and facilitate investment in India by international companies. The existing companies are also allowed to raise foreign equity levels to 51 per cent for proposed expansion in priority industries. The use of foreign brand names for goods manufactured by domestic industry which was restricted has also been liberalised. India became a signatory to the convention of the multilateral investment guarantee agency (MIGA) for protection of foreign investments. The Foreign Exchange Regulation Act of 1973 has been amended and restrictions placed on foreign companies by the FERA have been lifted. Companies with more than 40 per cent of foreign equity are now treated on par with fully Indian owned companies. New sectors such as mining, banking, telecommunications, highways, construction and management have been thrown open to private including foreign owned companies. These relaxations and reforms of policies have been accompanied by active courting of foreign investors at the highest levels. The international trade policy regime has been considerably liberalised too with lower tariffs on most types of importables and sharp pruning of negative list for imports. The rupee was made convertible first on trade and finally on current account.

As a part of this reform the government also removed some of the restrictions on Indian outward FDI. The modified guidelines for Indian direct investment in joint ventures and wholly owned subsidiaries abroad issued in October 1992 provide for an automatic approval for proposals where total value of Indian investment does not exceed US \$ 2 million of which up to US \$ 5 00 000 could be in cash and the rest by capitalisation of Indian exports of plant, machinery, equipment, know-how, or other services and goods. The

approval for other proposals including external borrowing, use of export receipts blocked abroad, etc. will be made within 90 days after a due consideration with respect to the track record of Indian party in terms of external orientation and financial viability of proposed investments etc. Another modification in the guidelines has been with respect to export of second-hand or reconditioned machinery which is now allowed but was prohibited earlier.

Inward FDI The comparable figures for FDI inflows for the early 1990s are not yet available. However, some trends can be discerned from the figures of approvals of FDI in the 1991-93 period. The liberalisation of the policy regime seems to have led to considerable improvement in the investment climate in the country. For instance, the FDI approvals over the three years totalled Rs 131 billion in contrast to the total stock of FDI existing in March 1990 valued at Rs 27 billion (Table 1). The approvals, however, have been slow in materialising into actual inflows and are still much lower than FDI inflows received by other developing countries such as China. The share of manufacturing in these approvals has gone down to 51.2 per cent largely because of opening of new areas such as power generation, petroleum refining, a number of services which have claimed a large chunk of approved FDI. Within manufacturing sector, the processed food and beverages sector has claimed the largest chunk of FDI accounting for 23.3 per cent of approved FDI in manufacturing. It appears that created assets of foreign enterprises in a consumer goods industry such as food processing in the form of internationally well known brand names have considerable appeal in the local markets. Medicinal and metal products, electrical goods, and chemicals and pharmaceuticals are other important sectors.

Another noticeable trend in the recent period is with respect to the organisational structure. The liberalisation of policy has removed the policy barriers that were neutralising the internalisation advantages of foreign investors to the country. Table 5 shows that the proportion of foreign collaborations that are internalised through FDI in total approved has gone up from just over 16 per cent in the 1970s to over 44 per cent during the early 1990s. Therefore, the balance between FDI and licensing is shifting in favour of FDI. Furthermore, majority foreign ownership which had become restricted to certain exceptional cases during the 1970s because of regulations is becoming more popular again. Table 6 shows that majority of approvals over the past three years have been in the 50-74 per cent range. A number of MNEs have taken advantage of new rules to increase their stake in their existing affiliates in the country.

One of the objectives of the current reforms of policies is to remove impediments for export-oriented manufacture in general and to attract MNEs to locate efficiency-seeking FDI in the country. These investments could help India in expanding manufactured exports by using her as export platform. The majority of the recent approvals of FDI, however, aim to explore India's sizeable and expanding domestic market. The efficiency seeking FDI have yet to start flowing to the country in a considerable manner. It may be too early to expect such FDI to start flooding the country. Yet in an era of stiff competition among developing countries to attract export-oriented FDI, liberalisation of policies alone may not be enough to win the race [see Kumar 1994b, for empirical evidence]. More active negotiations and bargaining with MNEs may often be required. India should use her bargaining advantages such as large domestic markets, abundant supply of trained and low wage labour, vast pool of technical professionals, well developed capital markets, etc. more effectively to attract a greater proportion of efficiency-seeking FDI. We have elsewhere elaborated the imperative of attracting export-oriented FDI for India and have outlined steps involved in such a strategy [Kumar 1994a, Postscript].

Outward FDI The 1991-93 period has also witnessed the liberalisation of restrictions to remit cash abroad for making outward FDI. The removal of these restrictions as well as improved transparency of policy regime perhaps explains a record 345 outward investments being approved with a projected Indian equity of Rs 11 65 billion. Thus 57.3 per cent of 600 ventures abroad at the end of 1993 accounting for 77.5 per cent of total Indian outward FDI have been committed between 1991 and 1993 (Table 2). The liberalisation of FDI codes seems to have made a more dramatic difference to the outward than to inward FDI.

West Asia accounts for a big chunk (39 per cent) of India's FDI in the period. However, bulk (26 per cent) of it is on account of a single large natural resource (petroleum exploration) seeking project in UAE. The emergence of Israel as a host to a fertiliser project has also contributed to it. The South East Asia hosts 67 ventures with a 14 per cent share of all FDI abroad. African countries hosted 27 projects with 7.86 per cent of FDI. India's contiguous neighbours in South Asia which had been trailing behind South East Asia and Africa in terms of their importance as hosts of Indian FDI attracted 29 ventures with a 7.2 per cent of total investments. Indian investments in this region had been restricted to Nepal and Sri Lanka. Since mid-1980s, however, Bangladesh and more recently Maldives have played hosts to Indian enterprises. East and Central European countries have retained their place

as significant hosts of Indian FDI with 53 ventures and 6.81 per cent of FDI. Among the manufacturing sectors, chemicals and pharmaceuticals continue to dominate as in the 1980s (Table 3). It is followed by light engineering which has been a traditionally important sector for Indian FDI.

The trend of emergence of industrialised countries as significant hosts of Indian FDI which was visible in late 1980s gathered momentum during the 1991-93 period. 133 of the 345 ventures representing nearly 23 per cent of India's FDI during that period were set up in the industrialised countries. Western European (mainly EC member states) countries have hosted the bulk (nearly 58 per cent) of Indian FDI in industrialised world in the early 1990s. The formation of single European market in the EC protected from the outside world by common external tariffs has prompted MNEs worldwide to make market-defensive FDI in one of the member states [see Kumar 1994c, for an analysis of response of MNEs from different regions to the European integration]. Indian FDI appears to have followed the rush for FDI in the EC countries by setting up trading subsidiaries to protect and strengthen their presence in the EC market. A considerable proportion of Indian FDI in North America has been in the engineering and consultancy services (Table 4). These FDI have something to do with the growing internationalisation of Indian software industry. In the software industry in fact the country is fast emerging as a global player. This has attracted considerable investments by world's largest information technology enterprises to locate software development centres in India. A number of Indian software enterprises have also set up affiliates in the US not only to market their own product but also to benefit from the agglomeration economies and spillovers from more established firms in the silicon valley. The latter are, to some extent, examples of strategic asset-seeking investments.

CONCLUDING REMARKS

The above analysis has examined the trends and patterns in FDI inflows into India over the post-independence period as well as the emergence of Indian enterprises as direct investors abroad in the background of changing policy regime. The sectoral pattern of FDI in India reveals a shift in favour of more technology and skill-intensive industries as the country industrialised itself. The Indian government policies appear to have played an important role in shaping this pattern by affecting the relative configuration of ownership, internalisation and locational advantages of foreign investors in the country. Indian investments have been made over the years in a large number of countries all over the world. However, a clear divergence is

seen between India's FDI in countries below India in the levels of economic development and in those above it. In the former, the ownership advantages of Indian enterprises in the form of technology and product adaptations, human resources, experience of operating in a developing country environment and ethnic links have led to investments in manufacturing. In industrialised countries and increasingly in South-East and East Asian newly industrialising countries these ownership advantages cannot provide competitive edge to Indian enterprises vis-a-vis host country enterprises. In these countries Indian FDI largely represent strategic investments made in trading subsidiaries to provide a marketing backup to Indian exports or those in human resource-intensive services where Indian enterprises have accumulated some advantages and capability. Over the years Indian outward FDI appears to have grown in terms of their skill content as in terms of geographical and sectoral coverage.

In terms of the IDP framework, India moved to the second stage some time in the 1970s when local enterprises had accumulated certain created assets to be able to operate abroad. The current reforms are geared to sharpen the competitiveness of country's enterprises and to improve its place in the international division of labour and move to the third stage of IDP. Export platform production (or efficiency-seeking FDI) by MNEs could be an important mean of expanding manufactured exports of a country. The recent liberalisation of policy regime has not yet succeeded in attracting export-oriented FDI in a considerable manner. In the current environment of intense competition among developing countries to attract such FDI, just the liberalisation of policies may not be adequate. More effective use of India's bargaining advantages with respect to MNEs such as her large domestic market, abundant supply of skilled manpower and technical professionals at low wages, etc., is desirable to attract a greater magnitude of export-oriented FDI, as we have argued elsewhere.

[An earlier and slightly different version of this paper was presented at the UNU/INTECH-Erasmus University Workshop of Foreign Direct Investment, Economic Structure and Governments held in Rotterdam on December 15-16, 1994 and benefited from the comments of participants. Anne Hogenbirk provided excellent research assistance.]

Hindu Men, Monogamy and Uniform Civil Code

Flavia Agnes

The Hindu Marriage Act, 1955 transformed a Hindu marriage from an ancient and vedic 'sanskara' or sacrament to a modern and dissoluble contract. It also introduced for the first time the principle of monogamy. Little attempt has been made however to rectify numerous lacunae in the act which provide ample scope for a Hindu man to escape both from the criminal consequences of a bigamous marriage and from the economic responsibility towards the second wife.

I

Debate Circumvents Basic Issue

THE recent Supreme Court directive in the Sarla Mudgal case¹ has strengthened the arms of the Hinduva forces whose main political plank in the forthcoming elections will be the uniform civil code. The media publicity following the judgment seems to have sidetracked the basic issue i.e. bigamy by Hindu men. Hence the various presumptions made by the judgment have remained unaddressed, some of which are listed below:

- (i) Hindu marriages are monogamous in nature
- (ii) The judiciary has consistently and systematically upheld the principle of monogamy among Hindus by penalising the errant husbands
- (iii) The only breach of monogamy among Hindus is by conversion to Islam. To quote from the judgment: 'there is an open inducement to a Hindu husband who wants to enter into a second marriage to become a Muslim'
- (iv) A uniform civil code will plug this loophole and ameliorate the sufferings of Hindu women
- (v) All the four petitions which the judgment dealt with were filed by women whose husbands had converted to Islam and remarried and
- (vi) Both the judges who heard the matter advocated enforcement of a uniform civil code on a priority basis as the only remedy to conversion and bigamy by Hindu men

Until 1955, Hindu marriages were polygamous and hence Hindu men did not attract the penal provision of S494 IPC. The Hindu Marriage Act of 1955 for the first time laid down the principle of monogamy. To what extent has this principle been accepted by the Hindu society? The rhetoric of a uniform civil code does not concern itself with this issue. An indication of the status of Hindu marriages in the post 1955 period came to us in 1974 in the report of the Committee on the Status of Women *Towards Equality*. As per this report, the rate of polygamous marriages among Hindus, Muslims and tribals for the period 1951-60

is as follows: Hindus - 5.06 per cent, Muslims - 4.31 per cent and Tribals - 17.98 per cent.

No thought or effort was directed to rectify the lacunae of the act which transformed a Hindu marriage from an ancient and vedic 'sanskara' or sacrament to a modern and dissoluble contract. The contract was not required to be registered and all customary forms as well as 'shastric' rituals were acknowledged by the act as valid forms of solemnising it (see Appendix for the various legal provisions on this issue).

Since the act recognised all customary forms of marriage and divorce, the uniformity among Hindus was a legal fiction created by the act. The ambiguity of the act provided ample scope for a Hindu man to escape both from the criminal consequences of a bigamous marriage and from the economic responsibility towards the second wife. Prior to the act, since polygamy was validated by the ancient Hindu law and customs, women in bigamous marriages had a right of residence and maintenance. By introducing monogamy, women in bigamous relationships lost their right to maintenance, legitimacy and respectability.

II

Apex Court Sets Seal on Monogamy

The loopholes created by the act are only a preliminary concern of this article. The major thrust is to counter the presumptions the judiciary has strictly upheld: the principle of monogamy among Hindus, conversion to Islam is the only avenue left for Hindu men to commit bigamy and a uniform civil code will plug this loophole. An analysis of the cases reported in law journals will establish that bigamy of the Hindu male persists with the active benevolence of the Supreme Court.

A decade after the enactment of the code which was hailed as modern, progressive and pro women, the Supreme Court decided the first case under the new act, which set the seal upon monogamy of the Hindu male. The appeal was against a conviction from the Bombay High Court in the case of Bhaurao Lokhande. The first wife pleaded that the second marriage was performed in the gandharva form prevalent in the region, which is customarily known as a 'pat' marriage. The

ceremonies of performing pat were described in detail: 'A carpet was spread, and the bride and groom sat on two separate pats (low wooden stools) besides each other. A copper (tambya) pitcher on which betel leaves and coconut were kept was brought and there was chanting of hymns and the couple exchanged garlands, then they struck each other's forehead. The father or the maternal uncle of the bride facilitates the striking of the forehead. This ceremony completes a gandharva marriage.'

One witness who had attended two other marriages in the gandharva form testified. Formerly a brahmin priest from the neighbouring Kasara or Dhardana came and chanted the mangal ashtak. The presence of a 'thakur' a brahmin and a barber was required. But in recent times, it was becoming difficult and expensive to secure the presence of a brahmin and a thakur from the neighbouring community and the community performed the ceremony only with the help of the barber.

The first wife pleaded that a person going through any form of marriage during the lifetime of his wife would be guilty of the offence and all the ceremonies of a Hindu marriage need not be strictly proved. The trial court convicted the husband and the second wife. This was upheld by the sessions court and the high court. At the final appeal, the Supreme Court acquitted the husband and held that the marriage was not performed in accordance with the requirements of the law and hence it was not solemnised.

Regarding the gandharva form, the court relied upon Mulla's *Hindu Law* (12th edn) which stipulated: "The gandharva marriage is the voluntary union of a youth and a damsel which springs from desire and sensual inclination. It has been erroneously described as an euphemism for concubinage. This view is based on a total misconception of the leading texts of the Smritis. The essential marriage ceremonies are as much a requisite part of this form of marriage as of any other unless it is shown that some modification of those ceremonies has been introduced by custom in any particular community or caste."

The court laid down that the two essential ceremonies for a valid Hindu marriage are: (i) invocation before the sacred, i.e. 'vivaha

homa' and (ii) seven steps round the fire by the groom and the bride, i.e., 'saptapadi'. The court further explained. It was contended that in the gandharva form of marriage prevalent in the community, the custom performance of certain ceremonies with the help of a brahmin has been abdicated. This does not mean that the ceremonies of 'homa' and saptapadi have been abrogated and that the ceremonies performed between the husband and second wife are sufficient to hold the marriage valid. The bare fact of a man and a woman living as husband and wife does not give them the status of husband and wife even though they hold themselves out before society as husband and wife and the society accepts them as such.

In the following year the apex court decided another case that of Kanwal Ram. The parties belonged to a village in Himachal Pradesh among whom a customary form of marriage called 'praina' is recognised. The custom does not include saptapadi. The essential ceremonies include offering suhag to the bride at her residence by a relative of the bridegroom, relative of the bride bringing the bride to the groom's house (praina), coins put in a pot, pooja and katha (reading of holy scriptures), bride picking up the pot and taking it to the family hearth, obsequance to the elders and feasting. The first wife admitted that pooja at the entrance and bowing at the hearth are essential ceremonies. The witnesses who were examined stated that suhag and praina was performed. But did not mention the other ceremonies. Prior to the prosecution for bigamy, the wife had filed a petition for restitution of conjugal rights. In reply, the second wife had stated that Kanwal Ram had married her after his first marriage was dissolved.

The husband was convicted by the judicial commissioner of Himachal Pradesh. But in appeal the Supreme Court acquitted him on the ground that conviction based on a statement of the accused that he had sexual relationship with the alleged bride and admission that the remarriage was performed after the first marriage was dissolved had not been testified. The court also ruled that an admission from the second wife cannot be relied upon as evidence against Kanwal Ram and further it cannot even be relied upon against the second wife. Relying upon *Bhaurao* the court held that to prove a second marriage, essential ceremonies constituting it must be proved.

The third leading case was in 1971. The wife relied upon husband's admission in maintenance proceedings where he had stated that due to the wife's conduct he was compelled to remarry. The priest who performed the second marriage did not elaborate on the ceremonies, but merely stated that the marriage had been solemnised according to Hindu rites. The wife pleaded that the performance of essential ceremonies must be presumed.

The trial court convicted the husband and second wife to one year of rigorous imprisonment and a fine of Rs 500 half of which was to be paid to the first wife. In appeal the sessions court upheld the conviction. The conviction was set aside by the Calcutta High Court.

The Supreme Court confirmed the acquittal and held. There is no dispute about the second marriage having been performed during the subsistence of the first marriage. But relying upon *Kanwal Ram* the court held that admission by the husband in proceedings for maintenance is not sufficient, further reaffirming the decision in *Bhaurao* held that proof of solemnisation of second marriage in accordance with essential religious rites is a must for conviction. The court further ruled that the sole responsibility of proving the offence with the clinching proof is upon the complainant i.e. the first wife.

Two more cases were decided by the Supreme Court in 1979. In *Lingari Obulamma* the parties belonged to the reddy community of Railseelma. The prosecution contended that the essential ceremony was putting a yarn thread and not performance of saptapadi and homa. One of the witnesses stated. Among kapus, each community performs the marriage according to their own custom. The kapus have only yarn thread instead of manglikutram. I do not know what is the custom (acharam) of the parties. There was no custom of agnigundam (going round the sacred fire). I do not know whether this is true of a secret marriage.

In appeal the Supreme Court upheld the acquittal on the ground that there was no evidence of any custom amongst reddy which outweighed the written text of law. The prosecution relied upon a decision of Andhra Pradesh High Court in *Dolgontu Raghava Reddy* which had held that among the reddy community of Telangana saptapadi and homa were not essential for a valid marriage. But the court ruled that since this case concerned reddy not of Telangana but Railseelma the same rule could not be applied.

In the same year the Supreme Court also decided the case of *Gopal Lal*. The parties belonged to telhi caste of Rajasthan. The husband remarried according to the local custom of 'nata' marriage. Two essential ceremonies of a nata marriage. Husband takes a pitcher of water which is placed on the bride's head and the bride wears the 'chura' (bangles) presented by the husband. The lower courts held that the second marriage was performed according to the custom of nata marriage prevalent in the telhi community and convicted the husband to two years rigorous imprisonment and a fine of Rs 2,000. The Supreme Court, at long last, recognised the validity of a local custom and the proof of the same having been performed. But the court reduced the sentence to one year.

iii Unsurmountable Obstacles

A discernible pattern emerging is conviction by the lower judiciary and leniency by the apex court which rescued the errant husbands by prescribing rigid standards for proving bigamy which rendered it impossible for even the high courts to convict the husbands as the following rules laid down by the Supreme Court became binding upon them.

- (i) Proof of performance of homa and saptapadi is essential for conviction of a Hindu man for bigamy.
- (ii) Performance of valid ceremonies cannot be inferred by leading the evidence of a purohit or an officiating priest.
- (iii) If a custom to the contrary is to be relied upon it must be validated by a law text.
- (iv) Admission by the husband in matrimonial proceedings i.e. divorce, maintenance, restitution of conjugal rights, etc. is not sufficient to prove bigamy.
- (v) Admission by the second wife is not sufficient.
- (vi) Husband and second wife living together as a domestic unit and the community accepting them as such is not sufficient.

The Supreme Court ground down the customs and rituals of a pluralistic society into an absurd notion of uniformity by enforcing upon them rituals which were traditionally confined only to higher castes of specific regions. If a community observed a custom which is contrary to the shastric ritual, the custom had to be privileged enough to attract the attention of a legal scholar, who would then have the good sense to mention it in a law text and further it should have remained static down the ages. In a vast country and within a dynamic society this would amount to the proverbial needle in a haystack and confine societies which are rapidly changing under the pressures of modernisation to fossilised forms, totally removed from their contemporary lifestyles. The *Bhaurao* judgment is a case in point.

IV The High Courts Follow the Trail

The high courts not only followed the trail, but in their zeal advanced the logic to absurd ends, erasing all hopes of justice and fairness in criminal prosecutions. Ceremonies performed in a temple, registration with the caste or temple authorities or even with a civil registrar fell short of the degree of clinching proof which the wife was expected to produce. The paternity of the child of a second marriage if proved could only amount to its bastardisation and not proof of bigamy by its father. The complainant wife could also lay herself open to the risk of invalidating her existing marriage.

Following is a random sampling of some reported judgments during the intervening period of 30 years from *Bhaurao* in 1965 to *Sarla Mudgal* in 1995. The vivid description of the marriage ceremonies of various communities at the risk of being repetitive is deliberate. The case law is relied upon not only to expose the hollowness of the provision of monogamy but as a study of a society rich in its diverse culture—a diversity which could be comprehended neither by our legislators nor by our judiciary and also to highlight the adverse implications to women of sweeping it with a brush of uniformity.

1965 *Jammu and Kashmir Hindu law does not penalise concubinage*⁸ The second marriage was performed in the village Dundal. The only evidence available was that people had assembled at the village and a priest officiated at the marriage. The priest had not stated that he had performed the requisite ceremonies. The first wife pleaded that the performance of valid ceremonies ought to be presumed since the presence of the priest was proved.

The sessions court convicted the husband with simple imprisonment of five months and a fine of Rs 25 which was confirmed by the sessions court. The high court acquitted the husband on the ground that all the ceremonies of a valid marriage were not proved. The court clarified: If the conviction is based on insufficient evidence, there would be no difference between concubinage and a lawful marriage. The legislature has made no provision to punish a person who keeps a concubine during the subsistence of the valid marriage. Since there was no evidence that the parties were governed by any custom which dispensed with *saptapadi* and *homa*, these two ceremonies need to be proved.

1969 *Assam and Nagaland Marriage among Ahoms* The husband married the first wife as per Hindu rites and subsequently remarried in the *saklong* form as per the custom of the Ahoms. Since the husband had admitted the second marriage, the prosecution did not lead elaborate evidence regarding the essential ceremonies.

The court referred to Gait's *History of Assam* where a *saklong* marriage is described as follows: The bride is brought into the courtyard and after walking seven times round the groom is made to sit by his side. One end of the cloth is tied around the neck of the bride, the other fastened to the bridegroom's waist. They walk to a corner, where nine vessels full of water are placed on plantain leaves. The master of the ceremonies reads from the *saklong* pathi. Three cups containing milk, honey and rice, fruitfully are produced, which the bride and groom have to smell. Some uncooked rice is brought in a basket into which, after the couple has exchanged knives, rings are

plunged, each finds the other's ring and wears it. The exchange of knives and rings is the binding part of the ceremony. The couple then pays homage to the bride's parents.

Since the prosecution had not proved the performance of these rituals, the court acquitted the husband and held: Mere admission of second marriage by the husband is not adequate.

1970 *Myore Invalidity of first marriage*⁹ The first marriage was solemnised at the renowned Tirupathi temple according to Hindu rites. The second marriage was performed at Jolarpet. During the proceedings, the first wife could not prove the performance of *homa* and *saptapadi*. So she relied upon proceedings for maintenance filed by her after her desertion. In his reply to her application, the husband admitted both the first and the second marriage.

The trial court convicted the husband with rigorous imprisonment of six months which was confirmed by the sessions court. But the high court held that the proceedings for maintenance are summary in nature, meant to prevent vagrancy and hence the degree of proof is not as high as in a prosecution for bigamy. When a woman initiates proceedings for bigamy against her husband, she cannot rely upon the presumption of a valid marriage which is laid down under S 50 of the Evidence Act and has to prove the validity of her marriage by proving the performance of essential ceremonies.

During cross examination, the purohit who had performed the ceremonies admitted that he was a teacher by profession for the last 18 years. He had not studied the Sanskrit texts and he did not know the existence of various forms of marriage under the Hindu law. The court held that because of his ignorance, *saptapadi* was not performed. The other witnesses who were examined did not know the meaning of *saptapadi*. The court held that since the validity of the first marriage was not proved, the second marriage does not amount to bigamy.

1972 *Kerala Ceremonies of Nairs*¹⁰ The witness merely stated that the marriage was performed according to the custom and practices of the community. The trial court convicted the husband with eight months rigorous imprisonment and a fine of Rs 100 which was confirmed by the sessions court. While acquitting the husband, the high court relied upon the acts passed by independent states of Cochin and Travancore in the last century. S 3 of the Travancore Nayar Act of 1888 stipulates that a conjugal union as per social custom and usage, solemnised by the presentation of cloth to the female by the male is a valid marriage for all legal purposes. S 4 of the Cochin Nayar Act stipulated that a valid marriage may be solemnised by the presentation of cloth to the female by the male or in any other customary form.

Since the second wife was from Cochin, the court held that the mere fact that some

ceremonies were performed at the Guruvayoor temple will not make it a valid marriage recognised by the community. Unless it can be proved that cloth was openly presented by the male to the female, it cannot be said that a valid conjugal union has taken place.

1973 *Bombay First marriage performed as per Neo Buddhist rites is invalid*¹² The first wife pleaded that the community had embraced Buddhism under the leadership of Ambedkar and she had been married as per the Buddhist rites of the community. She stated that she had embraced Buddhism after marriage but she could not prove that her husband had also converted to Buddhism. She described the marriage ceremonies as follows: In the mandap, the bride and groom sat facing each other on two sides of a table and recited an oath in the name of Buddha and exchanged garlands and clothes. It was a simple ceremony where two consenting parties took an oath to be husband and wife. This was followed by a *feast*. There was no invocation by the fire or *saptapadi*.

On her behalf it was argued that since under the Hindu Marriage Act the term Hindu includes Buddhist, the Buddhist rites should be recognised as valid. Since thousands of marriages were being performed in this form, the courts should lean in favour of recognising these marriages as valid to avoid social mischief (harm).

The comments of Justice Masadkar of Bombay High Court while acquitting the husband need to be quoted in detail. The concept of marriage under the Hindu law has not undergone any radical change by the enactment of the Hindu Marriage Act. In fact, the basic structure of that concept has not been touched and it remains a *sanskrit* or a sacrament. To a Hindu, marriage is not a matter of agreement or contract but a spiritual union of two souls. Holy invocation before the fire and *saptapadi* are its minimum requirement.

The argument that exodus from Hinduism to Buddhism should be taken note of and Buddhist rites should be held as part of Hindu rites for the purpose of marriage cannot be accepted. Only because such marriages are taking place due to some social or religious convulsions, the courts cannot be asked to hold that this custom should be treated as a rule having the force of custom or usage. A custom should be continuously and uniformly observed for a long time and should obtain the force of law among Hindus in any local area, tribe, community or group. The rule must be hardened into law by continuous and uniform observation. Since the wife herself has stated that the custom is in practice only for the last 10-15 years, the custom cannot meet the requirement of law.

It thousands of marriages are taking place in this or in any other form, an appeal lies to the legislature and not to the court of law. It is not the function of the courts to make the law or lay down social policies, but apply the law as legislated. The form of marriage that was followed is not according to any known custom or rituals sanctioned by the Hindu law. Since there was no proof of conversion and since homa and saptapadi had not been performed, the marriage between the first wife and her husband is not valid.

However, since it is mentioned in *Customs and Customary Law in British India* by S. Roy that consent is an essential element of the marriage tie between two Buddhists and no ceremony is requisite, if it was proved that either party was Buddhist it might have been possible to hold the marriage was valid.

1974 Gujarat: Proof of registration under the caste panchayat of Luhana community insufficient.¹³ The first wife proved bigamy of the husband by producing a registration certificate (*Nondh*) which contained the signature of the husband, the second wife and an office bearer of Luhana Mahajan Vandi. Based on this, the trial court convicted the husband. In appeal, the sessions court acquitted the husband on the ground that mere registration of the marriage with a caste panchayat or admission by second wife is not sufficient. The high court affirmed the order of acquittal on the ground that no one had deposed that registration of marriage was the only requirement of marriage of the Luhana community.

1975 Calcutta High Court: Registration of marriage under the Special Marriage Act insufficient.¹⁴ (Section 16 of the Special Marriage Act, 1954, an optional secular marriage act provides for a subsequent registration of a marriage solemnised under any religious rites. Once the marriage is registered under this act, the parties are bound by the provisions of the secular law regarding marriage and divorce and the provisions of the Hindu Marriage Act do not apply to them. Registration under the act is sufficient proof of the validity of marriage.) After performing a bigamous marriage under Hindu rites, the husband registered the marriage under S. 16 of the Special Marriage Act. During the trial, the first wife relied upon the certificate issued by the registrar under this act to prove bigamy. Relying upon it, the trial court framed charges.

The second wife appealed to the high court which quashed the charges on the ground that the certificate cannot be a proof of the marriage performed in other form prior to the registration. It only records a declaration by the parties that they have gone through another form of marriage before the registration. Such declaration cannot be a proof of performance of saptapadi and homa.

1985 Bombay High Court: Invalidity of first marriage.¹⁵ During proceedings for

bigamy, the husband admitted that the second marriage was performed during the subsistence of the first marriage according to the ceremonies and the customary rites. The trial court convicted the husband and the second wife to three months rigorous imprisonment and a fine of Rs. 300. In appeal, the sessions court acquitted them on the ground that the first marriage cannot be held to be proved merely by the admission of the husband. To establish a valid first marriage, the prosecution should prove its solemnisation. Since the validity of the first marriage was not proved, there can be no conviction for bigamy.

Relying upon *Kanwal Ram*, the high court confirmed the sessions court order that the first marriage cannot be proved by an admission. The prosecution pointed out that in *Kanwal Ram*, the Supreme Court ruling regarding strict proof was confined to the second marriage. But the high court held that since a strict proof of the validity of the second marriage is required, it is not understandable as to why such a strict proof is not required for the first marriage also. If it is necessary for the complainant to prove all the essential requirements of a valid second marriage, then by the same standard and reasoning it is also necessary to prove all the essential requirements of a valid first marriage.

1989 Andhra Pradesh: Ceremonies of marriage among the Kammas.¹⁶ The first marriage was solemnised according to Hindu rites at Tirupathi. Subsequently, the husband remarried. Evidence of persons who had attended the second marriage was relied upon who stated that the second marriage was performed by putting jeelakarra and bellam on the couple's heads, chanting of mantras and tying a mangal sutra.¹⁷ Thereafter, the husband went through another marriage ceremony with the second wife according to Muslim rites. The husband and second wife lived with the husband's parents, worshipped Hindu deities, celebrated Hindu festivals and were known by Hindu names. The second wife wore *mangalsutram*, *metlu* and *tilakam*, symbols of marriage among kama women.

The trial court convicted the husband and the second wife. In appeal, the sessions court held that since the first marriage was not proved, the second marriage does not constitute bigamy. The marriage under Muslim rites was in fact the first valid marriage. In appeal, the high court affirmed the acquittal but on totally different grounds.

(i) **The first marriage is valid.** Relying upon the husband's admission to the marriage prior to the filing of the complaint, the court ruled that the first marriage was valid. The court held: "There is a clear distinction with regard to the mode of proof for the first and second marriages. It is well-settled that the first marriage need not be proved with the

same degree of proof as the second marriage. Apart from the presumption under S. 50, Evidence Act, the admissions and other surrounding circumstantial evidence that has been brought in to prove that they are husband and wife is sufficient. It is very difficult to prove all the ceremonies or to remember all the events of a marriage which was solemnised 20 or 30 years ago as against the proof of a recent marriage which took place one or two years prior to the date of giving evidence. The court suggested that the standard of proof regarding the validity of first marriage should be lowered.

(ii) **Second marriage as per Muslim law is not valid.** Under Muslim law, there should be a proposal made by or on behalf of one party to the marriage and acceptance by the other in the absence of which the marriage will be void. The marriage under Muslim law is also not valid as the conversion was not real and bona fide and was only for convenience. Hence even if the formalities have been complied with during the performance of the marriage under Muslim law, it cannot be treated as a valid marriage. Since the parties continued to remain Hindus, the marriage would have to be proved under Hindu law and not Muslim law.

(iii) **Saptapadi and homa not proved in second marriage and hence no conviction for bigamy under Hindu law.** In kama community, homa is not necessary, but saptapadi is essential and it has to be proved by cogent evidence. One witness stated that touching of feet by each other is a saptapadi and it is a custom in the kama community. The court refuted this statement and commented that the meaning of saptapadi is totally different. Since there was no proof of saptapadi during the first and the second marriage, the court held that there cannot be conviction. The court also recommended that suitable amendment to the mode of proof of the second marriage. If second marriages are being performed in secrecy knowing fully well that it is an offence and if the courts insist on strict proof, it amounts to encouraging perjury, the court commented.

1990 Karnataka: Ceremonies of lingayat invalidation of first marriage.¹⁸ The first wife was employed as telecommunication office assistant with divisional engineer, Telegraphs at Hubli. Her father was a retired principal of a training college. The first marriage was through a proposal where cash and gold articles were given to the groom as per his demands. The marriage was performed in Hubli, as per the lingayat jangam custom on July 3, 1983. The wife described the ceremonies as follows: "After applying turmeric paste to the bride, 'surgi' was performed, the couple bowed before the gods and the bridegroom was tied with 'hasinga'. The bride was made to sit on a black woollen carpet and was gifted to the

groom. Then the groom tied the mangalsutra round her neck. Rice was showered on their heads. Then mantras were chanted and garlands were exchanged. The priest testified that Gouri puja was performed and the couple worshipped 'panchagurugalu', which was followed by Ganapati puja. Thereafter the wife returned to her natal home and on an auspicious day the husband had to come and fetch her. On July 8, 1983, he married another woman from the same community in Birur, Chickmagalur district. The second wife was a lecturer at the junior college at Larkate. Thereafter, he wrote letters to the first wife admitting the second marriage and asking her forgiveness for the mistake he had committed. The wife relied upon these letters and the photographs taken during both the marriage ceremonies.

The trial court convicted the husband to six months rigorous imprisonment and Rs 500 for each offence, i.e. going through a fraudulent marriage ceremony and cheating. The sessions court reduced the sentence to one day and increased the fine to Rs 10,000 for each offence. In appeal, the husband's advocate did not dispute the celebration of the two marriages but only contended that they were not performed as per the valid ceremonies of Lingayat jangam community according to which, after completion of all items, the saptapadi must be performed. While setting aside the conviction, the high court held: 'Since saptapadi was not performed in both the marriage and since in the complaint it was not specifically stated that in Hubli saptapadi was not in vogue, neither marriage was valid'. The court also ruled that the first wife was not the aggrieved party. It was the second wife who ought to have lodged the complaint. Since the second wife or her father have not filed any complaint, there cannot be any conviction.

1992 Allahabad - Ceremonies of Raudas community¹⁸ The haryans belonging to Raudas community recognised polygamous marriages which are known as 'Ghar Bethau'. The two essential ceremonies of the marriage are placing of bangles on the bride's hand by the husband and a wedding feast. The second wife also had an earlier marriage subsisting. Although the wedding feast could not be proved, the trial court convicted the accused. The sessions court upheld the conviction but reduced the sentence. In appeal, the high court acquitted the husband and held: 'The second marriage was void since both the parties had an earlier spouse. In addition, the ceremony of holding a feast was not completed. Even if the earlier spouses were excluded, the second marriage would still not be valid as an essential requirement of the said marriage had not been performed'.

1994 Allahabad - Arya Samaj rites¹⁹ The husband was convicted by the trial court but acquitted by the sessions court. In appeal, it

was argued that the second marriage was performed according to Arya Samaj rites for which three and a half round of sacred fire were sufficient to complete a valid marriage. But the high court held that according to sanskar vidhi, after the patikrama round the sacred fire, the bride and the bridegroom have to take seven steps and each step should be taken after pronouncement of a specific mantra by the groom. The court held that the ceremonies of Arya Samaj wedding remain the same as any other Hindu wedding. Since there were no pleadings regarding customary rites and saptapadi was not proved, the second marriage was not valid and hence there can be no conviction for bigamy.

1995 Madras - Proof of paternity of the child of subsequent marriage irrelevant²⁰ During prosecution, the husband and second wife specifically pleaded that there was no marriage at all between them and that the second wife was a virgin. The first wife produced a birth certificate to prove that a son was born to second wife and her husband. She pleaded that parentage of the child is material to decide the factum of the second marriage and applied for a paternity test.

While dismissing the application, the high court held that the wife had to prove that the essential ceremonies were performed in both the marriages and asked how a paternity test of the child would prove the same. The court further held that this was only an attempt to put a slur on the chastity of the second wife and undermine her dignity.

V

Illusory Nature of a Hindu Marriage

A reading of the judgments brings home the point that a Hindu marriage is an illusive legal occurrence, the validity of which is constantly suspect. In their evidence, the

witnesses have used terms and idioms which can only be interpreted within a specific cultural context. Perhaps a magistrate who is familiar with customs and traditions of the local area, is able to relate these idioms to people's lives. Hence one can observe convictions at the level of trial courts. But for the higher judiciary, prevailing over the citadels of justice in their ivory towers, these terms can only mean 'technicalities' which do not in any way relate to the cultural realities of the people whose lives and legitimacy they determine. If the ceremonies of a marriage performed at the renowned temple of Tirupati could not stand the scrutiny of the courts, what will be validity of marriages performed at informal spaces, i.e. courtyard of a Hindu home in the rural area or a marriage hall in the urban area.

The courts have upheld the ancient brahminical rituals of homa, saptapadi and kanyadan which are derogative to women, against more egalitarian and secular forms. The imposition of a uniform norm where none existed has caused further confusion. It needs to be mentioned that to many of the communities, whose ceremonies are discussed above, the Hindu code did not bring any progress as the communities already recognised divorce and remarriage of women prior to the code. The marriages were neither sacramental, a union of souls or a bond between a man and woman to the exclusion of everyone else. These concepts imposed either by a foreign Christian doctrine or by an upper class brahminical tradition do not have much relevance to these cultures.

The artificial imposition of monogamy has not been able to regulate customary practices of polygamy and simultaneous marriages. As can be observed, the marriages discussed in the case law have been performed in full public view with the participation of the

CONFERENCE ANNOUNCEMENT

Conference on Science and Technology in Reconstruction and Development (STRAD)

23-26 September 1996, Pietermaritzburg, South Africa

Call for Papers

The third international conference of the Third World Science, Technology and Development Forum. The conference will explore all issues, including gender, environment, legal, technological, in relation to the role of science and technology in economic development.

Proposals for papers, by June 1996 with 250 words abstract to, and further information from

community. The pat and nata were accepted forms of remarriage of divorcees and widows in the western region. The point in question is not whether there have been convictions for bigamy but whether a norm of monogamy which is far removed from the customs of the community can be effectively imposed.

The Bombay High Court judgment regarding neo-Buddhist rites indicates the ostrich-like attitude of courts which reflect not only gender bias but also class and caste biases. Refusal to validate the forms of ceremonies of dalits and imposing upon them the shastric ceremonies of homa and saptapadi is adding insult to an age-old injury. Ironically, Ambedkar, the arch supporter of Hindu law reform, seems to have made no provision for the validation of the marriages of the community whom he led out of the Hindu fold in 1956. How can the rituals practised by them meet the standard of an ancient immemorial custom having the force of law?

The ceremonies of Arya Samaj marriages are another controversial issue. One of the judgments cited above has held that the Arya Samajis are Hindus and hence the marriage can only be solemnised by homa and saptapadi. But in *Vivahikuyila* (roughly translated marriage shops) which have mushroomed in all metropolitan cities, such marriages are routinely performed by unscrupulous lawyers and are referred to as affidavit marriages. The formalities can be completed within an hour at a premium. Neither a notice nor any documentary proof of age, marital status or domicile is required. The marriages have a pretension of being performed according to *Arya Samaj* rites which dispenses with homa and saptapadi. Only a Hindu can avail of this quickie marriage. But infidels need not be daunted. A priest is available at hand to issue a certificate of conversion.

These marriages of convenience will not stand the test of legal scrutiny in proceedings of bigamy. Through a stroke of luck, civil courts still apply the presumption of validity under S 50 of the Indian Evidence Act which lays down that a valid ceremony will be presumed if a couple lives together as husband and wife and the community accepts them as such. But as the reported judgments are binding on the lower judiciary, there can never be conviction based on proof of such marriages.

The legal position can be summarised as follows. A Hindu husband can live in a polygamous marriage with impunity so long as he does not perform either one of the ceremonies of homa or saptapadi. Since most communities do not even consider these formalities as essential, non-performance of these ceremonies does not pose any obstacle on the path of a Hindu husband desirous of committing bigamy. If in the case of a second marriage, both spouses have an earlier valid

marriage subsisting, then in any case the second marriage will be void and will not attract the provisions of S 494 IPC.

While the Hindu male is granted a clear advantage, the disadvantage is suffered by two sets of women. The first wife stands the risk of invalidating her own marriage in a prosecution for bigamy. If she cannot prove the valid ceremonies of her marriage, the court will validate the second marriage and thus she will not only lose out in the bigamy proceedings but will lose her economic rights in matrimonial proceedings.

A notion still prevails amongst Hindus that a bigamous marriage can be contracted if the first wife consents to it. Since only a first wife can initiate the complaint, the belief is not without any legal base. With the consent of the first wife, the husband need not fear conviction for bigamy. But since the consent of the wife will not validate the second marriage, the husband will be redeemed of all economic liabilities of the second marriage.

The disadvantages suffered by the second wife have not received any attention by the advocates of monogamy. When a woman approaches the court for maintenance, a routine ploy adopted by husbands is to question the validity of her marriage by stating that he either has an earlier marriage subsisting or that the woman is a concubine or in popular parlance a mistress or keep. Then it is left to her to prove the validity of her marriage both in terms of ceremonies as well as its monogamous character. If the husband can prove that he has an earlier marriage subsisting, the second wife will have no legal recourse left.

I am constrained by the scope of this article from venturing into an elaborate discussion about the attitude of judges in maintenance proceedings. But the fact that out of the 40 cases of maintenance reported in Volume I of *Divorce and Matrimonial Cases (DMC)* 1994, in 36 per cent of the cases husbands raised the plea of validity of their marriages is suffice to establish the point that the defence is used widely by Hindu husbands to deny the maintenance to wives. In 16 per cent of the reported cases, the courts upheld the plea and denied women the maintenance.

Contrary to popular belief that the four petitions were filed by women whose husbands were converted, one of the petitions was filed by the second wife, whose husband induced her to convert and marry him and subsequently due to pressure from the first wife reconverted to Hinduism and lived with the first wife. The woman has a two-year-old son out of this marriage.

While the Supreme Court eulogised a uniform code as a remedy for all ills, it has not commented upon the status of this child. Does a court have the power to declare a valid marriage contracted under Muslim law between Muslims as invalid? At para 18 Justice Kuldip Singh makes a curiously

ambiguous comment. The marriage solemnised by a Hindu husband after embracing Islam may not strictly be void under the Hindu Marriage Act because he is no longer a Hindu. The review petition which is admitted seeks to clarify this legal position of the child and its mother.

The second judge on the bench in the controversial case, Justice Sathar, has made a valuable suggestion. No religion permits deliberate distortions. The government should consider the feasibility of appointing a committee to enact a Conversion of Religion Act immediately to check the abuse of religion by any person. The law may provide that every citizen who changes his religion cannot marry another wife unless he divorces his first wife. The provision should be made applicable to every person whether Hindu, Muslim, Christian, Sikh, Jain or Buddhist. Such a move could effectively deal with the problem of conversion and bigamy which the judgments seek to arrest.

It also needs to be pointed out that while Justice Sathar concurred that enforcement of a uniform civil code is made it to be pursued, he cautioned that it would be possible only when sentiments and emotions have to be cooled and tempered by a concerted effort and advocated several intermediate measures as stepping stones towards the uniform code.

But ours is a secular democratic republic. Freedom of religion is the core of our culture. Even the slightest deviation shakes the social fibre. While a unified code is imperative, the first step should be to recognise the personal law of the minorities to develop religious and cultural unity.

This note of caution seems to have been totally drowned in the media campaign for the enforcement of a uniform code on a priority basis. It is wishful thinking (or a ploy) to advocate a uniform code as a means of curbing polygamous tendencies of men. If codified Hindu law worsened the situation of Hindu women, what is the basis upon which a uniformity is being advocated for lesser mortals?

[I would like to acknowledge the contribution of Shumya in researching this article.]

Appendix

THE HINDU MARRIAGE ACT 1955

§ 2 Applicability of the Act

(1) This act applies

- (a) To any person who is a Hindu by religion in any of its forms or developments, including a Virashaiva, a Lingayat or a follower of Brahmo, Prarthana or Arya Samaj;
- (b) To any person who is Buddhist, Jain or Sikh by religion; and
- (c) to any other person domiciled in the territories to which this act extends who is not a Muslim, Christian, Parsi or Jew by religion.

S 5 Conditions of a Hindu Marriage

A marriage may be solemnised between any two Hindus if the following conditions are fulfilled namely

(1) neither party has a spouse living at the time of the marriage

S 7 Ceremonies for a Hindu Marriage

(1) A Hindu marriage may be solemnised in accordance with customary rites and ceremonies of either party thereto

(2) Where such rites and ceremonies include the sapthapadi (that is the taking of seven steps by the bridegroom and the bride jointly before the sacred fire) the marriage becomes complete and binding when the seventh step is taken

S 8 Registration of Hindu Marriages

For the purpose of facilitating the proof of Hindu marriages the state government may make rules providing the parties to any such marriage may have particulars relating to their marriage entered in such manner and subject to such conditions as may be prescribed in a Hindu Marriage Register kept for the purpose

S 11 Void Marriages

Any marriage solemnised after the commencement of this act shall be null and void and if it contravenes clauses (1) of S 5

S 17 Punishment for Bigamy

Any marriage between two Hindus solemnised after the commencement of this act is void

if at the date of such marriage either party had a husband or wife living and the provisions of S 494 and 495 of the Indian Penal Code shall apply accordingly

INDIAN PENAL CODE

Chapter XX Of Offences Relating to Marriage

S 494 Marrying again during lifetime of husband or wife Whoever having a husband or wife living marries in any case in which such marriage is void by reason of its taking place during the life of such husband or wife shall all be punished with imprisonment of either description for a term which may extend to seven years and shall also be liable to fine

THE INDIAN EVIDENCE ACT 1872

S 50 Opinion on relationship when relevant When the Court has to form an opinion as to the relationship of one person to another the opinion expressed by conduct, as to the existence of such relationship of any person who as a member of the family or otherwise has special means of knowledge on the subject is a relevant fact Provided that such opinion shall be sufficient to prove in marriage proceedings under the Indian Divorce Act 1869 or in prosecutions under section 494 495 497 or 498 of the Indian Penal Code 1860

Child Labour in India: Results of Methodological Survey in Surendranagar and Surat Districts of Gujarat State

by *Pravin Visaria and Paul Jacob*

The book presents the results of a methodological survey of over 5000 households selected from 90 villages and 100 urban blocks in two districts of Gujarat state. The survey, conducted during March-May 1993, has identified the conditions under which children join the workforce. The perceptions and preferences of children and their parents about the continuation of child labour have also been ascertained. The schedules tried out in the survey and the elaborate tabulations attempted with the data are presented in the book along with detailed comments on the strengths and weaknesses of such studies.

Here is what one reader had to say on reading the book

"The book bears all the marks of authors' meticulous search for facts and lucid analysis and presentation. I do not recollect any study on this problem with so much to offer."

National Accounts Statistics of India-5

Capital Stock, Capital-Output Ratios and Factor Incomes

EPW Research Foundation

THIS set of statistics, the fifth in this series, presents the CSO estimates on (a) capital stock by type of institution and by industry of use as well as the implied crude estimates of average and incremental capital output ratios for different sectors of the economy and (b) key national accounts statements on factor incomes and property incomes by economic activity.

I Capital Stock and Capital Output Ratios

Capital stock of a country is broadly referred to as that part of national wealth which is reproducible. It consists of all resources which contribute to the production of goods and services. The United Nations Statistical Office (UNSO) defined national wealth as 'total of various kinds of net tangible and intangible non-financial assets of residents plus financial claims on non-residents less financial liabilities to non-residents' [CSO 1989]. Tangible assets have been further classified into (i) reproducible tangible assets (i.e. capital stock) comprising fixed assets and stocks of goods and (ii) non-reproducible tangible assets like land, timber tracts and historical monuments. The reproducible fixed tangible assets (i.e. fixed assets for the production of goods and services) commonly known as 'fixed capital stock' comprise assets in the form of residential buildings, non-residential buildings, dams, irrigation and flood control projects, other construction works, transport equipment, machinery and equipment, breeding stock, draught animals, dairy cattle and the like, and capital expenditure on land improvement, plantations, orchard developments and afforestation. It also includes uncompleted construction assets. The stocks include the inventories of goods in the producing industries, with trade and other industries and stocks of goods with government services. However, durable consumer goods including gold and silver in the hands of households which are not used for further production of goods and services, as well as fixed assets mainly meant for defence purposes such as warships, fighter aircrafts, transport vehicles and war materials do not

form part of the fixed capital stock as these are assumed to have been consumed as soon as they are purchased. However, the construction works undertaken by the households including building and capital expenditure on residential dwellings for defence personnel, border roads, ordnance factories, etc., form part of the fixed capital stock.

In the national accounts literature, an overwhelming emphasis has been placed on flow accounts of production, consumption and accumulation. In the Keynesian literature or even in Harrod-Domar and other neo-classical growth models, the focus was on investment and not on capital stock, though the theoretical concept of capital as such has received considerable attention in various stages of the evolution of economic theory. Subsequently, even as the concept of capital stock came to be used in production functions of Cobb-Douglas variety, the UN SNA 1968 sought to integrate flow accounts with a system of national balance sheet wherein also estimates of net tangible assets (or capital stock) appeared only as a balancing item. No doubt, the concept of capital stock appears prominently in the SNA elsewhere in the context of the estimation of the consumption of fixed capital (CFC) at its current replacement cost which is required at various stages of national accounts estimation. Even in the Indian context, some systematic estimation of capital stock came to be evolved because 'the estimates of CFC were grossly underestimated' [CSO 1988a: 5 and Chaturvedi and Bagchi 1984].

Methodology and Data Sources

Until the release of the New Series on National Accounts Statistics in February 1988, official estimates of net capital stock by industry of use or by type of institution were not available, but a number of scholars undertook such estimates using the usual method of carrying forward some historical bench-mark estimates by official estimates of net capital formation. In the 1960s, the RBI published detailed estimates of tangible wealth. But the absence of regular series of net capital stock was acutely felt in regard to the estimation of consumption of fixed capital (CFC); the methodology of CFC

estimation differed from sector to sector, and in respect of private and public sector corporates, it depended on depreciations permitted under income tax laws. When the Raj Working Group on Savings [RBI 1982] recommended the perpetual inventory method (PIM) for preparing the estimates of CFC for all the sectors, the CSO's National Accounts Division (NAD) had already begun the work in that direction. As early as in 1981, the estimates of fixed capital stock by industry of use were prepared by NAD which were compiled by carrying forward the bench-mark estimates of net fixed capital stock (NFCs) at the end of the year 1949-50 made by Mukherjee and Sastri (1959) with the help of the official estimates of net fixed capital formation (NFCF) as available in the NAS. Subsequently, in pursuance of the recommendations of the Advisory Committee and of the Working Group on Savings, the NAD prepared firm estimates of capital stock using the Perpetual Inventory Method (PIM) by constructing life tables of various types of assets; the estimates of stock of inventories also have been worked out in order to arrive at the estimates of total capital stock which includes NFCs as well as stock of inventories.

Perpetual Inventory Method (PIM) is the most common method used for making the estimates of written down replacement cost for fixed capital stock. Figures of the written down replacement value of the stock of fixed assets on a given date are based on figures of GFCF classified according to type of fixed assets and year of acquisition, accumulated over a period to cover the acquisition of all fixed assets. The period should be long enough so that the fixed assets acquired before that period would have been retired. Conceptually, the cost of acquisition of each class (same type and same year of acquisition) of fixed assets is adjusted to current gross replacement cost by an index of the average change in prices from the year of acquisition to the date in question, and allowance valued at current replacement cost for accumulated depreciation between the two dates is deducted in order to arrive at its written-down current replacement cost. In practice, the perpetual inventory may be built year-by-year at the constant prices of a given

base year. Net capital formation during a year, adjusted to constant prices for a class of fixed assets is added to the written down value of its accumulated net capital formation as of the beginning of the given year at constant prices. The resulting constant price value of the net capital stock as of the beginning of the next year is converted to current replacement cost as of the later date. Once the perpetual inventory is built, it is to be maintained year by year by the same means as are outlined above [CSO 1989].

PIM necessitates the availability of reliable estimates of the average life of various types of fixed assets in different industries. The CSO has provided a list of assumed average life for each type of assets [CSO 1988] on the basis of the past studies as well as discussions held with the officials of the Directorate General of Technical Development, Ministry of Industries, the Railway Board and other agencies. The life profile of fixed assets so constructed ranges from 8 years for tongas, rickshaws and carts, 9 years for agricultural machinery, 20-25 years for manufacturing machinery and electricity generators, to 80 years for pucca buildings and 100 years for irrigation works and improvement of land. In the case of roads and canals, no depreciation is provided as it is felt that the current expenditures on their repairs and maintenance are perceived to be sufficient to maintain such assets in tact [CSO 1988b].

NAS provides estimates for NFCS, CFC and stock of inventories for each of the institutional sectors/sub-sectors and for industries within these institutional sectors in the Indian economy (Tables 19 to 21A and 21B). When the estimates of CFC were thus revised in the 1980-81 series based on the estimated net fixed capital stock and assumed life table of assets, the provision of CFC turned out to be nearly 50 per cent higher than in the previous series [CSO 1988a].

In addition to presenting the basic data on net fixed capital stock (NFCS) and net capital stock (NCS), we have also worked out crude annual series of average capital-output ratios (ACORs) representing capital stock to NDP and fixed capital stock to NDP ratios, the latter even by industries, for each year. This has been done by measuring the average of beginning and year-end capital stock as ratio of the year's NDP. Incremental capital-output ratios (ICORs) have also been worked out at the aggregate level. Many attempts have been made by official agencies as well as scholars from time to time to estimate ACORs and ICORs for the Indian economy using different methods [Gupta 1988]. In order to obviate the fluctuating nature of the ratio essentially due to fluctuations in rates of growth of the economy, ICORs have

been worked out for groups of years such as five year plan periods [Planning Commission 1992] or by using regression specifications where estimated investment is regressed on value added originating in different sectors [Gupta 1988].

By their very nature, trends in capital-output ratios subsume a variety of factors: capital intensity of production, technological levels, changes in the composition of investment and output (say, in favour of engineering industries and from engineering to chemical industries), rising real costs in certain sectors like irrigation and mineral development where the easier opportunities had been exhausted first and various forms of inefficiencies in resource use including time and cost overruns and absence of synchronisation in inter-linked projects [Planning Commission 1992].

Quality and Limitations of Database

The steps involved in the estimates of capital stock are indeed mind boggling with the need to classify myriad types of assets, arrive at their life profile and use appropriate price deflators, all of which involve some subjective judgments and the process of averaging. Also, there is no way of gathering information on the nature of capital stock classified by technology. Accidental damages to capital stock and technological obsolescence are often not reported and this might result in overestimation of capital stock [RBI 1982: 111]. The revaluation and depreciation adjustments in a highly inflationary situation also continue to be arbitrary [Gothoskar 1983]. The replacement cost arrived at from various price series can be taken as only approximations to market values. Serious problems arise in accounting for quality changes [CSO 1989].

Brief Results

The capital-output ratios, average as well as incremental, for the economy as a whole separately for the total capital stock and fixed capital stock and also separately for institutional categories, have been calculated for each year from 1981-82 to 1993-94. As can be seen, changes in ACORs for the economy as a whole (at constant prices) are somewhat indistinct over the years, whereas ICORs exhibit vast fluctuations. The latter fluctuations are significantly more in real terms than in nominal terms. Secondly, reflecting relatively higher prices of capital goods than the general level of prices, the ACORs based on nominal estimates are slightly higher (average of 3.17 for the latest five-year period) than those based on real numbers (average of 2.91). Thirdly, because of the significant capital-intensive

nature of public sector activities and other characteristics subsumed in the ratios as mentioned above, the ACORs for the public sector are significantly higher than those for the private sector as a whole. This is understandable because, fourthly, the highest level of ACORs ranging from 20 to 24 is to be found in electricity and the Railways, the public sector monopolies (Table 22). Amongst the commodity producing sectors, the lowest ACOR of about 1.25 (also a decline from about 1.40 in the mid 1980s) has been in respect of agriculture but the relatively low ratio of about 2.50 shown under the manufacturing sector is because the data include both registered and unregistered manufacturing. Finally, a preponderant part of the capital stock held in the form of inventories is with the trade followed by the manufacturing sector (Tables 21A and 21B).

II

Factor and Property Incomes

Factor Income

The estimates of factor incomes at current prices, introduced initially by the CSO in 1976, were a useful source of data to study the relative shares of the factors of production in the domestic product from different sectors of the economy. However, when the 1980-81 series of NAS was introduced, the estimates of factor incomes for the whole economy (i.e. except for the public sector) were not included due to non-availability of certain basic data. Subsequently, the CSO filled this gap by reintroducing the estimates of relative shares of factor incomes and property incomes in the net domestic product for all the years since 1980-81 [CSO 1994]. The categories under which factor incomes are normally measured are (i) compensation of employees, (ii) rent, (iii) interest and (iv) profits and dividends. The basic concept recommended in the SNA originates from the production account of industries in which factor incomes appear under the distribution of domestic product and this distribution is done only between (a) compensation of employees, and (b) operating surplus, with the latter covering both entrepreneurial profits and dividends as well as property incomes, namely interest and rent. However, an important complication arises in the Indian context (which is true of many other economies) because of the existence of unincorporated enterprises and household industries which either do not maintain accounts or are wholly managed by self-employed workers, in which case the factor incomes generated cannot always be separated between income from labour and

other factors. It has, therefore, become necessary in such cases to introduce the additional item of 'mixed-income of self-employed' to take complete account of the factor incomes generated. Besides, in the treatment of rent in the Indian NAS, there are differences from the ones recommended in the UN SNA. In the Indian NAS, the rent paid by an industry for structures, machinery and equipment and other goods, is treated as a factor payment and not as a payment for a commodity-type service as recommended in the SNA. This treatment is primarily guided by the non-availability of separate data on rent received/paid on structures, machinery and equipment as distinct from those on land. Secondly, in the Indian NAS no imputation for rent has been made for using own building, machinery and equipment except for residential buildings.

The estimates of factor incomes have been prepared by institutional sectors and by industry of origin. The traditional institutional categories of public sector, private corporate sector including co-operatives and household and private unincorporated enterprises are broadly classified into organised and unorganised sectors. Likewise, the economic activities under various sectors are divided into organised and unorganised sectors depending upon the organisational set up or the data base available for the estimation of the domestic products. As usual, household and private unincorporated enterprises are treated as a residual. The private corporate sector has been merged with the private organised sector.

The estimates of factor income presented here as (i) compensation of employees, (ii) operating surplus and (iii) mixed income of self-employed are prepared by distributing the estimates of net domestic product (NDP) in the above categories.

Property Income

In the estimates of factor income, the components of property income, namely, rent and interest were contained in operating surplus. However, separate estimates of property incomes and imputed banking charges (IBC) by different institutional sectors and classified by industry of origin have been provided by the CSO. The benchmark estimates of rent have been moved to other years using estimate of working force and the implicit price index of rent of residential building. As said earlier, in the NAS, no imputation for rent has been made for using own building, machinery and equipment except for residential buildings. The benchmark estimates of interest have been moved to other years

with the help of specially prepared index of interest using the interest rate along with outstanding credit for various activities.

The imputed banking service charges are estimated as the excess of interest/dividend received by the banking sector over the amount of interest/dividend paid by it. The imputed bank income is considered as charges paid by different sectors to the banking sector. To determine the service charges for each of the sectors, the imputed income is allocated to the relevant activities on the basis of institutionwise deposits with the banks and the institutionwise loan disbursement by the banks. The IBC thus determined have been allocated to various sectors as their intermediate consumption and thereby reducing the value added of the sector by that amount. Thus duplication of value added from the banking sector is avoided. At present in the NAS, no deduction is being made towards the IBC in respect of the unorganised sectors like agriculture, forestry, etc. on the assumption that these are taken care of in the existing estimation procedure of value added. Thus in the organised sectors, the value added gets reduced to the extent the IBC has been allocated as intermediate consumption in that sector.

Limitations of Database

The mixed income of self-employed covers total income of own account workers as well as the profits and dividends generated in the unincorporated enterprises. Although the additional item of 'mixed income of self-employed' to take complete account of the factor incomes generated has been introduced, it is not a clear functional classification of incomes generated, but such a separate category for an economy like India with large number of unincorporated enterprises is unavoidable.

The benchmark estimates of compensation of employees are required to be moved to other years with a combined indicator of persons employed and wage index. However, on examination of data it is noted that the estimates of working force of hired worker which is directly related to compensation of employees is not available on a comparable basis at two points of time to project the hired worker over a period of time. As a result, the estimates of working force based on population census, etc., have been used. This procedure is based on the assumption that the proportion of hired worker to own account worker remains the same throughout the study and so does the trend in compensation of employees, mixed income of self-employed and NDP will be more or less the same since the share of rent and interest is comparatively low.

Trends in Factor Incomes

First, it is found that the share of the organised sector in total NDP registered an improvement from 30 per cent in 1980-81 to 36.5 per cent in 1986-87 but stagnated thereafter until the mid-1980s was attributable to the public sector with the organised private sector showing no rise at all. Secondly, within the organised sector, the share of compensation of employees in the sector's NDP has steadily fallen from 74.2 per cent in 1980-81 to 67.4 per cent in 1992-93 with a corresponding rise in the operating surplus, whereas in the NDP originating in the unorganised sector, the proportions of both compensation of employees and the mixed incomes of the self-employed have remained unchanged at about 21 per cent and 79 per cent respectively (Table 23). Thirdly, in the distribution of property incomes, the proportion of interest has risen significantly in all the sectors, while that of rent has fallen. But it should be noted that in the Indian SNA, rent estimate is partial as explained earlier. Finally, with the stepping up of interest rates in organised banking, imputed banking charges (IBC) has shown a significant rise as percentage of property income as well as value added (Tables 24 and 25).

[This note, along with the compilation of the statistical tables has been undertaken by Pramita Debnath Bhattacharya, Munde and V. P. Prashant.]

INSTITUTE OF ECONOMIC GROWTH

UNIVERSITY ENCLAVE, DELHI-110007

Applications are invited for the post of Reader/Research Associate for the Indian Economic Service Section at the Institute in the scale of pay of Rs.3700-125-4950-150-5700/2200-75-2800-100-4000 with usual allowances admissible at the Institute from time to time. **Essential Qualifications for Reader:** Good academic record with at least Second Class Master's Degree with Ph.D. in Economics or equivalent published work. Five years' experience of teaching in under-graduate/post graduate classes and/or post doctoral research work with evidence of published work. Preference will be given to those having research experience in the fields agriculture, rural development, employment and international trade and finance. **Essential Qualifications for Research Associate:** Good Academic Record with at least Second Class Master's Degree in Economics with M.Phil/Ph.D. Preference will be given to those having research experience in the fields agriculture, rural development, employment and international trade and finance.

It will be open to the Institute to consider names of suitable candidates who may not have applied. The Institute reserves the right not to fill up any of the positions advertised, if circumstances so warrant. The Institute also reserves the right to offer tenure appointments against the above positions on consolidated salary basis.

Applications, with full details, should reach the Director on or before 31st December, 1995.

DIRECTOR

SPECIAL SUBSCRIPTION OFFER !**PIRG FEATURES**

Beginning January 1996, you can get a packet of PIRG FEATURES, every month. India's first monthly feature service on structural adjustment programme, debt, Transnational Corporations, trade, WTO, World Bank and IMF policies, environment and developmental issues. It also carries updates and latest news on people's resistance and struggles at the grassroots. The aim of PIRG FEATURES is to present a true picture of the impact of new economic policies which is often distorted by government's propaganda and media.

Every packet consists of articles, reports, opinions and interviews on the issues. The packet consists of 4 articles alongwith current news and reports. Each feature is written by a specialist in the area. The writers include economists, researchers, campaigners, activists and columnists. The issues covered by the PIRG FEATURES are following :

- | | |
|----------------------------|---------------------------------------|
| ■ Indian Economy | ■ TNCs |
| ■ World Trade, WTO | ■ Consumer issues |
| ■ Structural Adjustment | ■ Labour issues |
| ■ Debt Crisis | ■ Environmental issues |
| ■ World Bank, IMF policies | ■ People's struggle and many more.... |

PIRG FEATURES will be extremely helpful to researchers, economists, students, activists and organisations interested to understand the implications of new economic policies.

Subscription Rates: Rs. 400 for 1 year

**SAVE
75%**

Special Offer

Pay only Rs. 200

Saving 50% on the Price, and get
book "State of India's Economy 1994-95" and
"Alternative Economic Survey 1993-94"
(worth Rs. 100) **free !**

Act quickly. This Special offer is valid for a limited period, till March 31, 1996

Order Form

☐ 1 year Special Subscription at Rs. 200 for PIRG FEATURES

SEMINAR ON ENVIRONMENT & ECONOMICS

March 28-30 '96, New Delhi

The main objective of the seminar is to closely examine the linkages that exist between economy and environment and to explore the interface between the two. In particular, the attempt will be to assess the state of fiscal understanding related to sustainable development and to undertake an evaluation of the role of economic policies in this grand design.

The seminar will also strive to create public opinion and awareness on these issues. It will provide an opportunity for academicians, policymakers and activists to come together and share a common platform. The event will be predominantly for young economists, social scientists and environmentalists to understand the domain of environmental economics.

The 3-day seminar will comprise of the following themes, divided into three groups:

▲ INTERNATIONAL ISSUES

ECONOMICS OF GLOBAL WARMING • ECONOMICS OF BIO-DIVERSITY CONSERVATION • ECONOMICS OF OZONE LAYER PROTECTION • ECONOMICS OF DESERTIFICATION • ECONOMICS OF FISHERIES • ECONOMICS OF GREEN ACCOUNTING • TRADE AND ENVIRONMENT • TRADE IN TOXIC WASTES • ECOLOGICAL TAX REFORMS

▲ NATIONAL ISSUES

ECONOMICS OF SUSTAINABLE LAND MANAGEMENT • ECONOMICS OF SUSTAINABLE WATER MANAGEMENT • ECONOMICS OF SUSTAINABLE FOREST MANAGEMENT • ECONOMICS OF POLLUTION CONTROL • ECONOMICS OF TOXIC AND SOLID WASTE MANAGEMENT • ECONOMICS OF ENERGY EFFICIENCY AND CONSERVATION • ECONOMICS AND ENVIRONMENTAL HEALTH • ECONOMICS OF WILDLIFE CONSERVATION • ENVIRONMENT AND EMPLOYMENT • ENVIRONMENTAL ASPECTS OF CONSUMPTION PATTERNS • INVESTMENTS AND ENVIRONMENT

▲ THEORETICAL ASPECTS OF ENVIRONMENTAL ECONOMICS

Participants will include social scientists, particularly economists, government officials and policymakers, NGO representatives, researchers, environmentalists and academicians

Individuals interested in contributing papers to the seminar are advised to contact the organisers within the dates specified.

For sending abstracts of papers 31.01.96

For sending papers (preferably on a floppy) 28.02.96

A committee of eminent economists and environmentalists will screen papers to be presented at the seminar

Note: CSE will arrange for financial support only for those whose papers are finally selected for presentation.

Vol XXX No 51

Religious Plurality and Gender Justice

Should religion-based personal laws be maintained or should a uniform civil code be instituted? The issue has to be addressed with precision because gender justice remains a desired horizon though the means of its legal institution have become controversial. Further it has to be addressed in ways that do not surrender to the present ideological rationale of the Hindu majoritarian right for a uniform civil code an aggressive anti Muslim agenda that takes shelter under the insignia of a unified nation. However the political and theoretical ground for a rejection of the Hindutva version of unified nation will have to be different from the now fashionable postmodernist diatribes against nation and unity. 3287

Structural Adjustment and Agriculture

The agricultural and rural sector will inevitably experience its share of threats and opportunities under the Structural Adjustment Programme. The effects of the economic and policy changes on agriculture will be felt crucially in the areas of agricultural trade and capital investment in agro activities. A look at the emerging evidence. 3311

Taluka in Energy Planning

Energy self sufficient talukas can provide an alternative development model to the megacity-based, centralised energy model. A study of a taluka in western Maharashtra shows that all its energy needs in the year 2000 can be met by proper use of agricultural residues and energy plantations via agro-energy systems. 3315

Common Property Resources

Changing social and institutional circumstances put common property resources under severe stress despite their unchanged biophysical contexts leading to degradation of a community asset and erosion of environment friendly survival options for the people. Household and village data from six dry tropical states. 3278

Communal Violence

The year 1995 has not been the worst in the recent past in regard to the communal situation, but neither has it been free from communal violence. A review. 3267

China's Plans

The drafts of the Ninth Five-Year Plan and the second long-term plan, recently unveiled by China's planners, reflect in ample measure the optimism generated by past successes. But past record is no guarantee of future performance. 3277

Endangered

Weak and ill defined legislation on medicinal plants especially with regard to their export is resulting in the depletion of some rare species. 3270

Dismal Record

Government's compensation to Bhopal gas victims has been inadequate and based on underassessment of injuries. Further, lack of proper procedures and delays in disbursal have encouraged corruption. 3271

'Uneconomic' Schools

The closure by the Kerala government of several uneconomic schools where the student strength had gone down sharply has focused attention on the impact of the demographic transition on the education sector. 3274

State Income

Estimates of Net State Domestic Product and state per capita income. Special statistics. 3321

Technology Development in Fertiliser Industry

I HAVE no desire to prolong the controversy on what happened in the fertiliser sector in the 1960s and 1970s, but the kind of things that Biswajit Dhar (August 26) and Sudip Chaudhuri (September 2) have said about me demand a reply. Dhar accuses me of an attempt to obfuscate issues, the deliberate omission of vital facts and the playing of a harmful role in relation to the P and D Division of FCI; and Chaudhuri contemptuously dismisses the 'culture' of bureaucrats, which I exemplify in his view, and adds, for good measure, that *some* bureaucrats (presumably that includes me) do not pursue the national interest. Altogether, quite a nice line in abuse. I can ignore the abuse, but some of the points raised need to be answered.

(i) *'Unsubstantiated/irrelevant'*: I thought I should correct certain misperceptions in Chaudhuri's article by providing a piece of informal history—akin to memoirs. How does one *substantiate* one's memoirs, unless one has retained extensive collections of papers? It was in that context that I referred to a couple of supportive letters received by me. They were not adduced as 'evidence' in a discussion of issues, but merely as a measure of corroboration for my account based on memory. (How Dhar reads this as 'obfuscation' I shall leave it to him to explain.) As regards 'relevance', Chaudhuri advances a theory of who did what and why: I say 'No, that was not the way things happened; I know, because I was there'; Chaudhuri says 'That is irrelevant'. I am bewildered. It sounds to me like a conversation from *Alice in Wonderland*.

(ii) *The Sethna Committee Report*. The non-reference to that report in my account was not a deliberate act of omission but merely a reflection of the fact that it did not stand out in my recollection as a matter of importance. Dhar seems to think that that report was a valuable document which was deliberately suppressed. That is not my recollection, but his thesis cannot be confirmed or denied without a study of the old papers and files to which I have now no access.

(iii) *900 TPD/1350 TPD*: It is misleading to present the choice between 900 TPD and 1350 TPD ammonia plants as a question of indigenous technological development versus foreign technology. Neither P and D nor EIL nor any other Indian organisation had any process know-how or basic engineering capabilities for ammonia plants, whether of 1350 TPD or

of 900 TPD or even of 600 TPD. What these organisations could do was to obtain the know-how and the basic engineering from a foreign source, and provide detailed engineering; and then try to learn, absorb and internalise the imported technology. With the jump from 900 TPD to 1350 TPD the learning process would do doubt have had to start afresh and might have taken a couple of years, but thereafter P and D's role would have been exactly the same with 1350 TPD as with 900 TPD plants. The problem was not that it was decided to go in for 1350 TPD plants but that the careful arrangements for technology transfer, standardisation, a larger role for PDIL after the first two plants, etc, which had been initially worked out (when C F Braun was selected), were upset by the subsequent entry of Snam Progetti into the scene. (I left the ministry of chemicals and fertilisers in December 1978 and do not know what arrangements were made with Snam for the association of PDIL and the transfer of technology.)

(iv) *My old note of 1978*: That note became necessary because the revised cost estimates (RCEs) of a number of projects (which had run into serious problems) had to be submitted to the Public Investment Board (PIB) and the cabinet for approval. Anticipating severe questioning the ministry of chemicals and fertilisers decided to entrust a study to an independent agency, viz, the Institute of Financial and Management Research (IFMR), Madras. The ministry's purpose in commissioning that study was not to pin responsibility on P and D but exactly the opposite, namely, to identify the factors responsible, suggest remedial measures and draw lessons for the future. Dhar's charge that the IFMR's report was used to 'flog' P and D is grotesquely wide of the mark. Nor did I 'attach undue importance' to that report as alleged by Dhar. It was because I thought that the report did not go deep enough, and that the ministry's PIB note needed to be supplemented, that I submitted a note of my own to the PIB. In doing so, I was only performing the duties of my position and not playing a malignant 'role'. Far from blaming P and D or 'downgrading' its capabilities, the note drew attention to the multiplicity and complexity of the factors involved, including the difficulties arising from the kinds of foreign-exchange packages that the finance ministry had been able to put together. However, it was hardly possible to absolve the FCI and P and D completely of responsibility for the failure of a whole series of projects undertaken by them:

perfunctory project formulation and poor project management had to be acknowledged as being among the factors responsible. Chaudhuri is very generous and forgiving about that history: "Naturally problems were not unexpected." We cannot dismiss those egregious failures (which became symbols of 'public sector inefficiency') so lightly. 'Learning curve' was a part but only a small part of the explanation. It was precisely the history of those projects and the factors at work that I painstakingly (and, in intention at any rate, with scrupulous judiciousness analysed in my note of 1978. How Dhar could persuade himself that my note was an attempt to damn P and D is beyond my comprehension.

(v) *'Leave it to the technologists'*: Chaudhuri observes that "If the decision makers... had left matters to people who understand technology and believe in indigenous development, then the situation would have been far better". There are many things in that formulation that can be questioned but let us ignore them and ask: what exactly is Chaudhuri suggesting? That the government should have approved every proposal of P and D without examination; provided whatever fund were asked for; asked no questions about project failures; provided more funds to set those failures right, again asking no questions; and hoped that in the long run a bright new day would dawn for India. Chaudhuri may say that I am caricaturing his position, but am I really?

(vi) *Lack of support for P and D*: Chaudhuri says that "what P and D was trying to do was something new for an indigenous enterprise in a third world country". Was P and D unique? Could one not say the same thing about BHEL, HMT, the CEDB or Hindustan Steel (later MECON), Engineer India, and a host of other public enterprises? And were not some of them in fact more successful than P and D? What 'strategic and planning support' did they enjoy that P and D lacked? The ministries of heavy industries, steel and petroleum had their bureaucrats no less than the ministry of chemicals and fertilisers. All PEs function in the same ambience, struggle with similar problems and face similar constraints. Why then did EIL and MECON succeed and P and D (PDIL) become sick? I do not propose to answer that question as I have no desire to start a fresh round of controversy; but Chaudhuri and Dhar should ponder the question.

RAMASWAMY R IYER

New Delhi

Foreign Collaboration

THE Reserve Bank of India has been conducting periodic surveys of foreign collaboration arrangements, financial as well as technical, in force with private sector as well as government companies. From the first survey covering the period 1960-61 to 1963-64 to the latest fifth for the period 1980-81 to 1985-86, these have been designed to be census-type surveys of all collaboration agreements in force with joint stock companies. Though the RBI should be credited with pioneering the collating and presenting of comprehensive information on the nature and costs of collaboration, the surveys themselves have received only its half-hearted attention. Right from the beginning, the scope of the surveys was restricted to financial costs and did not consciously cover real costs and benefits of the collaboration arrangements. Thus the RBI, which was responsible for collaboration approvals, evaded its responsibility to provide answers to basic questions as to whether the objectives of technology transfer were being met, whether the adaptation, assimilation and diffusion of imported technology were being hindered by restrictive practices adopted by technology suppliers and whether consequently repetitive import of technology and inadequate domestic R and D were a feature of the Indian experience. There has been a paradigm shift in technology transfer policy after the FERA controls were almost done away with as part of structural adjustment after July 1991. This calls for strengthening and widening the scope of these surveys. It is time the RBI associated economists and other professionals in preparing the design and scope of the surveys and guiding the analysis of their results so that the right policy lessons can be drawn from them.

The latest survey covered 720 companies in the private sector, of which 47 were subsidiaries, 411 had minority foreign shareholding and 262 had only technical collaboration agreements. Of these 720 companies, 544 had entered into 942 technical collaboration agreements. After the implementation of FERA in the 1970s, there was a drastic reduction in the number of foreign companies from 540 as on March 31, 1974 to 335 as of March 31, 1986. The annual average of foreign collaboration approvals rose from 204 during 1965 to 1973 to 291 during 1974 to 1979. In the 1980s, however, there was a sudden jump, with the average touching 657 during 1980 to 1985. Some aspects of FERA implementation are reflected in the data from the latest survey. In the case of foreign minority companies, the share of foreign capital in total equity fell from 32.5 per cent to 28.3 per cent between 1981-82 and 1985-86. In the case of subsidiaries, FERA implementation brought down the proportion of foreign capital from 70.4 per cent in 1972-73 to 59.5 per cent in 1980-81.

Between 1981-82 and 1985-86 it remained unchanged at 58.6 per cent. But of the total increase in foreign equity in subsidiaries of Rs 23.6 crore, bonus shares amounted to Rs 20.8 crore. In foreign minority companies, against an increase of Rs 76.5 crore in foreign equity bonus issues were Rs 45.6 crore.

Some of the other findings such as high profitability of subsidiary companies and their relative efficiency as reflected in the ratio of value added to value of output are also not surprising. The foreign-controlled rupee companies have always enjoyed better profitability essentially because they operate in high profit areas. What is significant is that foreign technology *per se* does not seem to have conferred any significant benefit on the Indian companies in terms of profitability or operational efficiency. For the fifth survey period, gross profits to total capital employed in subsidiaries worked out to 19 per cent, whereas it was 11.6 per cent for foreign minority companies and 9.3 per cent for companies with only technical collaboration. Likewise, value added to value of output was the highest at 38.28 per cent in respect of subsidiaries against 25 per cent each for foreign minority and technical collaboration companies. But while profitability and relative efficiency are the highest for subsidiaries, they have had little to show by way of capital expenditure. Of total capital expenditure of Rs 6,767 crore during the survey period, the share of subsidiaries, which accounted for about 11 per cent of value added, was a mere 4.2 per cent, with the technical collaboration group accounting for 50.9 per cent and foreign minority companies for 44.9 per cent. The most interesting results relate to the costs of foreign collaboration. The earlier surveys had shown that the financial costs, both direct and indirect, are generally high during periods of liberalisation. The direct cost in the form of remittance of dividend, royalty, technical fees and other remittances showed a steady rise for all foreign collaboration companies from Rs 76.11 crore in 1981-82 to Rs 181.44 crore in 1985-86, with the total amount for the five-year period working out to Rs 598.12 crore against Rs 280.15 crore for the four-year period of the fourth survey (1977-78 to 1980-81). As percentage of value of production, the direct costs in the case of subsidiaries, for instance, declined from 3.4 per cent in the first survey to 2.8 per cent in the second, 2.1 per cent in the third and 1.3 per cent in the fourth; in the fifth survey it remained static at 1.37 per cent. This is not surprising because output of items produced under collaboration agreements constituted only about 23 per cent of the value of production of all the items produced by the companies. Measured at the level of individual collaborating companies, it is found that more than one-half of the agreements stipulated royalty rates in the highest bracket of 4.1 per cent

to 5 per cent (5 per cent being the statutory limit). Further, whereas subsidiaries should get the benefit of technology and know-how from their parent companies without formal agreements and without payment of technical fees, 25 out of 47 subsidiaries had entered into formal technical collaboration agreements with the parent companies. Again, about 71.2 per cent (671) of the collaboration agreements had 1,145 restrictive clauses. The most common restrictions related to exports; such clauses accounted for 87.3 per cent of all restrictive clauses. Of these, 83.4 per cent prohibited exports to the collaborator's country or to countries in which the collaborator operated through branches/subsidiaries/affiliates or was having similar collaboration agreement and even to certain other specified countries. Finally, aggregate exports of the foreign collaboration companies fell short of aggregate imports in each of the years and the cumulative shortfall during the survey period was Rs 1,691 crore. While imports grew by 103 per cent from Rs 927 crore in 1981-82 to Rs 1,881 crore in 1985-86, exports grew by 16.1 per cent from Rs 745 crore to Rs 865 crore. Total imports to value of production rose from 6.5 per cent in the fourth survey to 8.3 per cent in the fifth survey, while the proportion of exports to value of production slipped from 5.9 per cent to 5.6 per cent. While the foreign collaborations may have contributed to some degree of import substitution, the overwhelming focus of the foreign collaborators on the domestic market is clear. The growing import-dependence of the collaborating companies could also reflect another form of restrictive practice by the technology suppliers to siphon off funds through transfer-pricing.

JHARKHAND

JAAC in Distress

AS per the Jharkhand Area Autonomous Council (JAAC) bill, the elections to the council were to be held within six months from August 9 this year, the day on which the body was instituted. But, with delimitation of assembly constituencies and revision of electoral lists yet to begin, the possibility of the council elections being held before February 8, 1996 has been officially ruled out. Thus, faced with an uncertain future and a lacklustre performance in the past five months, the council has more or less confirmed the apprehension that the JAAC, instead of proving to be a step towards statehood, would serve to further split the ranks of the Jharkhand movement.

The over-representation given by Laloo Prasad Yadav to Jharkhand Mukti Morcha (Soren) and his Janata Dal (JD) in filling the quota of nominated members had led other Jharkhand groups to dissociate themselves from the council right from the beginning. When the three members of the Jharkhand People's Party-All Jharkhand Students Union (JPP-AJSU) combine decided to

participate in the council against the wishes of the party executives, the party headed for a split. Further, within the JMM(S) the Mahato lobby got disgruntled since neither of the coveted posts of chairman and vice-chairman of the council came its way. Shailendra Mahato, the party general secretary and MP, has been engaged in an open confrontation with Suraj Mandal, the party vice-president, over the issue of under-representation of east and west Singhbhum in the council. The acrimony ultimately culminated in directives expelling each other from the party. Now Shailendra Mahato is all set to join the BJP which has made inroads into the Mahato-Kurmi vote-bank of Singhbhum and had done very well in the tribal belt in the last assembly elections.

Though the JAAC has the sanction of the centre, the state Congress also had been sulking because only three Congress members were nominated to the council when the party had won 14 assembly seats from south Bihar. Nevertheless, the state Congress did not demand the scrapping of the council. But now with the Lok Sabha elections approaching and the worthlessness of the JAAC in expanding one's base being exposed, the state Congress, switching its line, has come out openly against the JAAC and demanded instead separate statehood for the Jharkhandis. The BJP is proceeding with its agenda of Vananchal, while the support extended to the CPI(M-L)'s recent bandh in the tribal region demanding dissolution of the JAAC indicates that the JAAC in its present state is no more looked upon as furthering tribal interests.

The forthcoming parliamentary elections has also propelled the discontented Jharkhand factions to come together to form the Jharkhand Front in a desperate bid to preserve their rapidly eroding base. The JMM(S) which was in the forefront espousing the cause of the JAAC is having second thoughts on its ties with Laloo Prasad Yadav. The recent decision of the Bihar government to vest itself with the power to make appointments to the third and fourth grade staff deprives the JAAC of its autonomy to make appointments within its own jurisdiction. Thus, with the JAAC being made more dependent on the state government, the JMM(S) belatedly sees itself as a puppet in the hands of Laloo Prasad. On the other hand, the Bihar chief minister, who had once declared that Jharkhand would be formed over his dead body, must be pleased to see the Jharkhandis in disarray, though how far this has helped to brighten the electoral prospects of his party is doubtful.

WEST BENGAL

Behind the Facade

WEST BENGAL's CPI(M) leaders seem to be in the habit of getting pricked by conscience, blurring out the truth occasionally and then retracting immediately.

The seniormost CPI(M) minister in West Bengal Left Front government Benoy Chowdhury (who holds the portfolio of land and land revenue) in a recent seminar in Burdwan, apparently exasperated by reports of endless corruption in the state administration, got it off his chest by describing his own government as one "of the contractors, by the contractors and for the contractors". When an opposition leader Jyoti Basu retorted by wondering how Chowdhury was still in the government if he thought it was corrupt, Chowdhury, after having made the statement. His junior in the party organisation in a bid to correct the damage hastened to 'clarify' that Chowdhury's attack was directed against the central government, and not the West Bengal government.

But facts are stubborn. Had Benoy Chowdhury been reported to have uttered the single sentence about contractors could have explained it away as 'misreporting'. But he did not leave it at that. In a similar vein, he continued in his address to the state administration, stating that corruption had become so rampant it was difficult to distinguish between corrupt and honest people. He seemed to be aware of the abuse that he would have to face from his party colleagues for his remark evident from his next comment when he said that he could not care less if some questioned his 'sanity' for making the observation. He was obviously referring to the price he would pay when his long-time comrade, the veteran CPI(M) leader of Tripura, Nityanand Chakravarty, was dismissed as 'senile' from the party when some time ago he had accused the West Bengal CPI(M) government of corrupt practices.

Although Benoy Chowdhury has recanted – persuaded perhaps by apprehension of exploitation of his remarks by the Congress (which has already swooped down upon Burdwan speech) in the coming elections, his denial will cut no ice. It is an open secret in West Bengal today that people suspect a large number of CPI(M) leaders and rank-and-file are minting money by colluding with scrupulous contractors, land speculators and underworld gangsters. In fact, after Benoy Chowdhury's outburst in Burdwan, another political leader within the party is a major partner in the Left Front government – Nikhil Das of the Revolutionary Socialist Party – acknowledged that the Front had not been able to break the 'contractor-bureaucrat nexus inherited from the Congress'. But apart from harping on the monotonous tune of blaming the Congress for every evil in West Bengal (where the Congress incidentally has remained in power for the last 18 years), the CPI(M) has done precious little to remove the popular suspicion about corruption among its leaders and ranks that have grown during its uninterrupted tenure in power for almost three decades now. Instead, the party leaders

has responded to allegations of corruption by peevish counter-allegations of 'Congress conspiracy to discredit the CPI(M)' - a bogey which no longer works in West Bengal. What is more obvious to the people in the state is the CPI(M)'s attempt to protect the guilty. To take an example, the Bowbazar bomb blast in Calcutta in 1993 exposed links between an underworld don and a leading CPI(M) leader who patronised him - a fact confirmed by both local public evidence as reported in the press and police records at that time. But after a lull in public pressure, the CPI(M) state leadership managed to get the guilty politician exonerated and rehabilitated in the party. The same year, the then information minister Buddhadev Bhattacharya of the CPI(M) resigned from the government. It was again an open secret that Bhattacharya had quit because of his unhappiness with the moral degeneration of his party - a fact which he shared with his confidants in the press which publicised it. But soon after when Bhattacharya was turned into a hero by the West Bengal Congress - which wanted to exploit the issue in its campaign against the Left Front government - Bhattacharya turned around and rejoined the government. His critics accused him of recanting for love of ministerial power.

Even Jyoti Basu himself off and on admits that his party and administration have failed to redress the grievances of the people of West Bengal. In fact the same day when Benoy Chowdhury was addressing the Burdwan seminar, Basu was speaking at a Left Front rally in Baruipur, a few miles away from Calcutta, where he acknowledged that his government had failed as far as the police was concerned, blaming it for links with criminals. What he forgot to add was that his own partymen also maintained links with these criminals.

It is one thing to believe that senior CPI(M) leaders like Benoy Chowdhury and Jyoti Basu are seriously concerned about criminalisation and administrative failures - as their occasional outbursts seem to imply - one wonders what prevents them from putting an end to such acts. Why can they not discipline the second ranking leaders of their party and purge it of anti-social elements? If the party has been hijacked by the contractors and criminals, as is being suggested by these veteran leaders, the latter then are obviously allowing themselves to be used as shields by the goons. Is it morally justifiable for them to remain in the role of a respectable facade behind which corruption and crime are allowed to thrive?

RUSSIA

Protest Vote

FOR all the reassuring noises being heard in the US and other western countries about how this month's elections to the Duma showed that democracy had really struck

roots in Russia, how the economic reforms there were really irreversible, how the Duma was anyway a powerless body, how in any case the communists were nowhere near the two thirds majority which alone would make it possible for them to make a grab for real power and how in other countries of eastern Europe and parts of even the former Soviet Union (Ukraine, Belarus) the communists had won more sweeping victories without significantly altering these countries' political direction, there can be no pretending that the strong upsurge of popular support for the Communist Party of the Russian Federation (CPRF) manifested in the elections is not a much more portentous development than what has been witnessed in any of the former socialist countries. The very different history of communism in Russia, which the CPRF leader Gennady Zyuganov sought to invoke in the course of his campaign for the parliamentary elections, through references to the defeat of the fascist hordes and the space exploits of Yuri Gagarin, has after all to be reckoned with. Not that the communists, showing in the elections was unexpected. Opinion polls before the elections had clearly foretold that they were going to emerge as the largest party in the Duma. The one surprise in the election was in fact the proportion of the electorate which actually voted - some two thirds, compared to just over 50 per cent in the 1993 elections - which says something about the people's determination to use the elections, the Duma's relative toothlessness notwithstanding, to register their protest at the way things have been managed in the country.

In the event the CPKF has won one third of the seats in the 450 member Duma, securing 22 per cent of the party list vote, 9 percentage points more than it did in 1993. Though Vladimir Zhirinovskiy's misnamed ultra-nationalist Liberal Democratic Party polled 11 per cent of the vote, the second largest share, this was only one half of what it had won in 1993. Only two other parties crossed the 5 per cent of the total vote barrier to qualify for a share of the 225 seats in the Duma election to which takes place on the basis of party lists (the other 225 seats being filled by elections from single member constituencies). Prime minister Viktor Chernomyrdin's Our Home Is Russia party won nearly 10 per cent of the vote and will have about 50 seats in the Duma. The fourth party, Yabloko, which won 7 per cent of the vote and will end up with almost the same number of seats as the prime minister's party, while favouring economic reform, is bitterly critical of the content and manner of implementation of president Yeltsin's reform programme. In all, 39 of the 43 parties, which polled a little over 50 per cent of the vote among them, failed to qualify for any of the 225 party-list seats in the Duma since they failed

individually to secure 5 per cent of the total vote.

The results of the election must be seen above all as a massive protest vote against Yeltsin's government and its policies. This is hardly surprising considering that between 1989 and 1994 real output in the Russian economy declined by between one third and one half, the annual inflation rate has been 200-250 per cent and real wages are between one half and three fourths of their level before the break up of the Soviet Union. In a recent interview, prime minister Chernomyrdin had to admit that the money incomes of 40 million people, some 27 per cent of the population, were currently below the subsistence wage, and the strongest evidence he could adduce for the success of the government's policies was that GDP had dropped by only 3 per cent in the first nine months of this year compared to a fall of 12 per cent in the same period of 1994. The obverse of the worsening plight of the vast majority of the people has been the free booting enrichment of a tiny section, including one-time communist party apparatchiks and government officials and public enterprise managers. The situation has been tailor made for the spread of lawlessness and criminality. To top it all, there has been Yeltsin's military misadventure in Chechnya.

Given parliament's lack of real power and the fragmented representation of parties and interests in it, the immediate significance of the results of the parliamentary elections is that they set the stage for the all important presidential election due in June next year. While Yeltsin has for the moment sought to play down the significance of the communist party's showing in these elections, claiming that it will make no difference to his government and that the reform programme will not be affected in any way, it is very likely that he will sing a very different tune soon. To rally support for himself (or his chosen candidate) in the presidential election, he may well try to turn the electoral success of the CPRF to his advantage by raising the spectre of a return of communism and the 'bad old days'. The low key response of Gennady Zyuganov to his party's performance in the parliamentary election suggests that he is not unaware of this possibility. While he, like almost every other party with the exception of the prime minister's Russia Is Our Home, has made no secret of his determination to secure the defeat of Yeltsin and his policies, Zyuganov has generally taken cautious positions on economic reforms and even on foreign capital, his emphasis has been restoring order and rationality in economic management while reinstituting minimum social services and security and of course, putting an end to Russia playing second fiddle to the US and the west. He has called upon all the parties opposed to the government to join a 'national patriotic coalition'. This, it would seem, will be the CPRF's broad strategy for the presidential election.

CURRENT STATISTICS

EPW Research Foundation

Structural changes occurring since bank nationalisation have been arrested from the beginning of the 1990s. The share of rural areas in total bank branches which was rising earlier, has begun to decline, the share of rural branches in bank deposits has tended to stagnate and in bank credit has fallen. The share of the top 100 banking centres in aggregate deposits, contrary to the past trend, has edged up between June 1990 and June 1995 but, more significantly, there has occurred a sharp increase in their share in total bank credit from 65.7 per cent to 72.5 per cent, suggesting growing concentration.

RAYMOND

Denim Project

A CHANGE of name was long overdue and in 1994 Raymond Woollen Mills became Raymond Limited in keeping with its diversified range of activities, namely, cement, steel and cosmetics besides wool. 1994 was different in another way. The company entered the international market with a GDR issue. The proceeds of the issue will go towards financing the expansion plans of the company.

The company closed the financial year ended March 1995 with a sales turnover of Rs 683 crore, up by 20 per cent over Rs 571 crore recorded in the previous year. A 26 per cent increase in the total income took it to Rs 728 crore from Rs 577 crore in the preceding year. Interest costs rose from Rs 29 crore to Rs 35 crore, a rise of 19 per cent. Provision for depreciation and tax increased by 13 per cent and 55 per cent, respectively but did little to dampen the net profit which stood at Rs 71 crore, up by 55 per cent from Rs 55 crore achieved in the previous year. A dividend of 50 per cent has been declared by the company.

Production of the cement division at Bilaspur increased by 25 per cent and would have been more were it not for severe flooding, power cuts and railway carriage shortages. The engineering division manufactures files and drills with the bulk of turnover coming from files. In engineering files, Raymond has a 75 per cent share in India and 22 per cent share worldwide.

Exports of the company showed improvement and stood at Rs 96 crore, up by 32 per cent from Rs 73 crore in the previous year. Imports at Rs 149 crore were up by 154 per cent from Rs 59 crore.

In textiles, the company has a number of projects in the pipe line. Raymond is entering into a collaboration with Calintri of Italy to set up a denim manufacturing project at an investment outlay of Rs 1,490 crore. The project is being set up in Maharashtra with an installed capacity of 10 million metres a year. Also coming up is a woollen fabric plant with an installed capacity of 5 million metres. The project is expected to be commissioned by 1996. The company is close to tying up with Zegna of Italy to manufacture and market premium suiting fabrics.

The company is setting up a new silicon steel plant at Nashik. Silicon steel is a specialised steel with magnetic qualities used for manufacture of electrical equipment. The project will have a technical collaboration with Allegheny Ludlum, USA.

BIRLA VXL

New Joint Ventures

Birla VXL, an S K Birla group company, manufactures its suitings under the brand names Digjam and OCM. The company with an interest also in chemicals, edible oils, electronic and electrical and telecommunication components plans to make a foray into the iron and steel sectors.

The company exports a substantial portion of its turnover to Europe, the US, West Asia, Hong Kong and Japan. Exports and imports for the year under review stood at Rs 25 crore and Rs 76 crore, respectively.

The textile division, comprising Digjam Woollen Mills and OCM Woollen Mills, and Saurashtra Chemicals form the core of the company's operations. The company has expansion cum modernisation programmes at both its textile units at an

estimated outlay of Rs 650 crores. The expansion plan envisages the installation of 40,000 new spindles, imported from Zinser, Germany, and 182 shuttleless looms from Sulzer, Switzerland, and Dormier of Germany out of which 52 looms and 12,000 spindles have already been installed. The plan of the company is to expand its fabric production capacity from existing 5 million metres to 12 million metres. VXL would be increasing the capacity of OC M plant to 35,000 metres a day from the existing 16,000 metres and Digjam to 30,000 metres a day from the existing 18,000 metres per day. Both the units have been accredited with ISO certification.

Demand for soda ash has started picking up after a lull in the past two or three years, and the company's soda ash division, Saukem, performed satisfactorily. Saukem is planning to increase its capacity from 3 lakh tonnes to 3.25 lakh tonnes annually at an estimated cost of Rs 19 crore. The plan would involve the upgradation of the plant with technical consultation from Krebs and Co, a Polish soda ash firm, for and the setting up of a captive thermal power plant. Saukem exports soda ash and caustic soda to Sri Lanka, Bangladesh, South-east Asia and West Asia. Its turnover of Rs 180 crore will touch Rs 269 crore in 1997-98.

The engineering unit VXL Electric & Cyrt (C) set up in 1990 manufactures state-of-the-art electric meters. The Swiss company holds a 40 per cent stake in the venture. ICG has also brought in its technology and is on the verge of manufacturing some of the finest quality electrical meter for both the Indian and overseas markets. The Joka factory of VXL ICG has a capacity of one million meter annually. Currently it produces about 3.5 lakh modern meter, 20 per cent of which are exported. Another about five lakh old meters are produced annually entirely for the domestic market. The company is planning to invest Rs 25 crore as part of its expansion and modernisation plan.

The company has plans to erect a power sector with a 75 mw coal fired power plant involving an investment of Rs 9,000 crore. The collaborator and the location of the plant have yet to be decided. A diversification into the rubber sector is also on the cards.

The company has tied up with Dormier of France to manufacture Dormier clothes in India. In the new company, Dormier will have an equity stake of 51 per cent while the rest will be held by Birla VXL. The company has entered into another joint venture with US based Haver Inc to manufacture readymade garments. The two partners would have a 50 per cent stake each in the export oriented project and invest Rs 10 crore initially.

The company has entered into a joint venture with Masuzawa and Co, Japan, to produce silk yarn using silk waste. The Japanese firm will hold 25 per cent of the equity. The spinning unit Birla Masuzawa, will be located in Amritsar close to the OCM factory of Birla VXL. Out of an initial investment of Rs 25 crore, Rs 5 crore is expected to be raised through equity. Also on the anvil is a post production centre for film in partnership with Mitsui and Co Japan.

HERO HONDA

Buoyant Demand

The first technical collaboration agreement was signed between Hero and Honda Japan in 1984. This contract has been renewed up to 2004 and includes transfer of technology for manufacture of Honda Motor's entire range of two wheelers including motor cycles, mopeds and scooters. Honda Motors also has an equity participation of 26 per cent in the company, with another 26 per cent belonging to the Hero Group while the rest is held by the public.

The two wheeler industry registered a growth rate of over 25 per cent in 1994-95. The current year indicates that the industry will achieve another 25 per cent growth in sales in 1995-96. It is estimated that by the year 2000 annual demand for two wheelers would be 4.2 million.

HHMI pioneered the 100cc motorbikes in India and currently has four models in the market. The company has increased its production of motorcycles to 1,83,490 in the year under review, up by 24 per cent over the previous year, resulting in capacity utilization of more than 100 per cent. For the year 1995-96 the company has a target of 2,40,000 motorcycles.

The company exported 10,457 motor cycles up by 100 per cent over the previous year. Apart from its regular markets the company penetrated new markets like Bermuda, Paraguay, Zaire and South Africa.

The company plans to expand the capacity of its plant at Dindurha from 1,47,000 to 2,10,000 in 1995-96. It is planning to introduce new models in the 150cc and 200cc segments. The first phase of expansion will add 1.5 lakh vehicles to the company's capacity. A Rs 40 crore loan from the Development Bank of Singapore and Rs 45 crore from internal accruals will go towards financing the expansion plans. The company is setting up a second plant with an installed capacity of 1,50,000 motor bikes. The plant is being set up at Gurgaon at an estimated cost of Rs 200 crore and trial production is to begin by September 1996.

NEW

Towards a New Politics

Agenda for Third Force

INREP

India is witnessing social ferment as never before. This is reshaping politics and giving Indian democracy a vibrant mass character. Parties like the Congress and the communal BJP are unable to express this and relate to it. But can an alternative Third Force emerge? Can it establish a New Politics and a New Vision?

This book argues that this is both feasible and necessary. It outlines the elements of a minimum programme necessary for a left-of-centre, secular, pro-people democratic alternative.

INREP is an independent group whose members include Praful Bidwai, Anuradha Chenoy, Kamal Mitra Chenoy, Muchkund Dubey, Seema Mustafa, Deepak Nayar, S.P. Shukla and Achin Vanaik.

Communalism and Communal Violence in 1995

Asghar Ali Engineer

The year 1995 was not the worst in the recent past in regard to the communal situation, but neither was it free from communal violence. A report on the year's incidents

THE year 1995 was not so bad after all from the viewpoint of communalism and communal violence though to be sure it was not entirely free of communal violence. In fact, the demolition of the Babri masjid in December 1992 and the riots following that cataclysmic event had, on the whole, a very sobering effect on the communal situation. It would not be wrong to say that the decade of the 1980s and early 1990s was the most critical period in India as far as inter communal relations were concerned. The BJP had adopted a softer variety of communalism when it was formed in 1980, but it soon hardened its stance to regain lost political ground. In its softer version of communalism it had to compete with the Congress since Indira Gandhi and Rajiv Gandhi too had opted for it, having lost the Muslim vote in the late 1970s. The BJP could not compete with the Congress without opting for a harder version of communalism. The hardening of its stance paid dividends and it increased its strength from two to 89 seats in parliament in the 1989 elections. Then there was no going back. It further added to its strength in the 1991 elections and won 118 seats. This tempted it to harden its stand on communalism, and at last the tragedy of December 6 occurred. However, it proved to be its nadir and communalism could not be made to pay any more political dividends. That explains the low intensity of communalism and communal violence both during 1994 and 1995. Here we are concerned with communalism and communal violence during 1995.

As pointed out above, the year 1995 was not entirely free from the curse of communalism and communal violence. In January 1995 itself there was a red alert as communal tension soared high in UP. *The Times of India* reported on January 14 from Lucknow:

"The state government today sounded a red alert with reports of communal tension pouring in from several parts of the state. Prohibitory orders were today promulgated in Sambhal town near Moradabad, following recovery of two bodies from a village this morning." Curfew was imposed in areas under five police stations of Moradabad district. The Rapid Action Force was deployed in Sambhal and the army carried out a flag march. According to an official spokesman, two BJP activists were arrested

under NSA and inactive worker of the Shiv Sena was detained under it. Thus Moradabad in UP witnessed communal violence in January 1995 which claimed about three lives. The dispute is started over a boundary wall around a well. It appears there was no planning behind this riot—it was a spontaneous outburst. No political party was involved in systematically provoking it and hence it was easily contained.

There was a small communal incident at Haridwar in UP in which several people were injured in stone throwing but no human life was lost.

Fortunately, the Idli flag hoisting issue in Hubli on January 26, 1995 which had witnessed communal violence on several occasions passed off peacefully. The newly elected Janata Dal government in Karnataka was determined to prevent any communal incident in that town. The Anjuman office-bearers agreed to hoist the flag themselves thus defusing the tension. On every August 15 and January 26, the people of Hubli had to pass sleepless nights for fear of communal violence. They now heaved a sigh of relief.

Another important event on the communal front was the publication of the Bhagalpur Communal Riots Inquiry Report in the third week of February 1995. The Bhagalpur riots had erupted in October 1989 claiming more than 1,000 lives. An inquiry commission was appointed but it laboured for close to six years before it could produce its findings. However, the report took a curious turn: the home secretary returned it. The report was far from unanimous. Two members of the commission, Chandra Prasad Sinha and Justice Shamsul Hasan, held the BJP, the VHP and the district administration mainly responsible for the riots. According to the duo, the Muslim fundamentalists also played a role but were not as successful as their Hindu counterparts. However, the chairman of the commission, Justice Ram Nandan Prasad, held the Congress guilty of provoking the riots. Thus the report became highly controversial and attracted varied comments in the press. The chief minister Laloo Prasad Yadav accepted the version submitted by justices Sinha and Shamsul Hasan and gave assurances that the guilty named in the report will not be spared.

On the occasion of Holi in March, communal violence erupted in some areas,

Aligarh, the highly communally sensitive district in UP, once again came under the spell of communal violence. More than seven persons were killed, mainly in sporadic stabbing incidents. The Aligarh riot was unplanned and spontaneous and hence could be brought under control. Its beginning was quite obscure but undoubtedly was the result of bitter feelings between sections of two communities in crowded localities of old Aligarh town. A woman, Mithileti Yadav, showed extraordinary courage and alertness and saved several lives by driving away a bus which was carrying a haraam with the help of her son. There was an attempt by local hoodlums and some college students to set fire to the bus. Had Yadav not shown alertness, the lives of several women and children could have been lost. Both the Moradabad and Aligarh riot clearly show that if communal violence spontaneously bursts out without the planning and involvement of any political party, it can be easily and speedily brought under control.

Another small incident of communal violence took place in Balesore, Orissa, again on the occasion of Holi in March 1995. A quarrel between children of two communities while playing Holi took a violent turn and the police had to resort to firing to disperse the violent mob claiming two lives. More than 50 houses were set ablaze. Shoot-at-sight orders were issued and the chief minister B. B. Patra ordered a judicial inquiry.

Agra in UP and Hubli in Karnataka also witnessed communal violence on the occasion of Holi in March. In the Agra incidents, one person was killed, but the Hubli violence turned out to be worst claiming five lives. More than 50 persons were injured in these communal disturbances. The violence broke out on March 21 outside a mosque inside a narrow lane. It allegedly started when some prankster threw colour on those inside the mosque. One person was killed right outside the mosque.

Another important development in early 1995 was election of the Shiv Sena-BJP government in Maharashtra and the BJP government in Gujarat. Though the Shiv Sena-BJP government in Maharashtra could win only 137 seats, falling short of a majority and formed the government with the help of independents, the BJP won an overwhelming majority in Gujarat. It is also interesting to note that due to the threat of strict implementation of the People's Representation Act (i.e. disqualifying any candidate using religious or communal appeal in election propaganda) by the chief election commissioner, Sushan, the Shiv Sena-BJP could not resort to blatant communal propaganda and had to content themselves with raising only secular issues. Thus the alliance made a host of promises such as provision of free housing to four million slum dwellers in Bombay and

provision of cheap foodgrains in ration shops, and 'jhunka bakhar' for one rupee, to win the hearts and minds of the electorate. It also enhanced its electoral appeal by exposing the corrupt deal for the Enron power project as well as the thorough corruption in the Congress regime. In Gujarat too, the BJP concentrated on providing clean government and solving people's problems in its election propaganda, though the VHP was simultaneously focusing on communal issues such as Ramjanma Bhoomi, etc. The elections in these two states show that if only the earlier CECs had the guts to implement the People's Representation Act strictly as Seshan did, the country could have been spared much communal agony. Even the Ramjanma Bhoomi issue would not have acquired such unprecedented dimensions. One wishes that future CECs will also stick to the act and implement it strictly as Seshan did.

Interestingly the Shiv Sena chief minister Manohar Joshi announced in March that his government will not allow anyone to indulge in communal violence and that his government will not spare anyone breaking the law in the name of religion. His announcement was made in Nanded where Hindu-Sikh riots had erupted in March. It is interesting to note that the Bombay commissioner of police Satish Sahaneys sincerely worked to maintain communal peace and took an active interest in forming mohallah committees in different areas of Bombay. His successor R D Tyagi is also taking an interest in mohallah committees and is keen to arrange training programmes for the police to decommunalise it.

However, it should be pointed out that the Shiv Sena-BJP government in Maharashtra took certain measures which alienated Muslims and enhanced their fears. It introduced a bill to ban cow slaughter completely, including all types (like oxen and buffaloes), abolished the Minorities' Commission, and also started a drive to throw away 'the Bangladeshi Muslims' whom Bal Thackeray estimates to be over 'two lakhs' in Bombay. But the police has not been able to throw out more than 200 so far. The alliance has announced that it will introduce a common civil code in the state. A bill prohibiting bigamy has already been introduced in the assembly.

Towards the end of the second week of April the Hindu Munnani office in Madras was rocked by a bomb blast. The bomb was allegedly planted by a Muslim youth Nizamuddin, who was also responsible for planting a bomb in the RSS office on August 8, 1993 by which some 13 people were killed. The Munnani was targeted because of provocative speeches being given by its state president Rama Gopalan and organising secretary Sridharan. Similarly a powerful blast took place near a place of worship (presumably a temple) in Rameshwaram, also on April 14. A BJP activist, a milk vendor, was also stabbed to death in Rameshwaram.

These blasts triggered communal violence in Tamil Nadu which claimed more than four lives. Coimbatore and Nilgiris districts were rocked by communal violence. Several areas in Madras city like Triplicane, Royapettah, and Pudurpet were tense. Tamil Nadu is not so sensitive communally but thanks to the Hindu Munnani activities and reaction by some Muslim fanatics, it has been experiencing communal violence now and then.

In May 1987 during the Meerut riots, 24 innocent Muslim youth were taken out of their houses and shot dead by PAC (Provincial Armed Constabulary) jawans and their bodies thrown into a nearby canal. A surviving victim told the story to the world of what happened on that fateful day (May 23, 1987), but the culprits were never brought to book. It was in April 1995 that the Mulayam Singh government announced that the 19 guilty policemen will be prosecuted. These policemen have been indicted by the CID. Those against whom the prosecution was to be launched included the then PAC platoon commander, five head constables, 11 constables, one naik and one truck driver. Normally no policeman is ever brought to book for his role in communal riots. It was for the first time that the UP government had taken a lead in this, but one does not know what will be its final outcome.

On April 30, communal violence broke out in Chitradurga district of Karnataka. Mobs belonging to the two communities (Hindu and Muslim) clashed in Holakere, 30 kms from Chitradurga, and the police resorted to firing in which one person was killed and two others seriously injured. The tension was the result of business competition between two groups of bus agents belonging to two communities, which first was personal but then took a communal turn. The April 29 violence erupted as a result of a verbal altercation between two groups. The groups were armed with cycle chains and clubs and attacked bus agents of the other community. Karnataka, it must be born in mind, has become highly communally sensitive since the BJP made a serious bid to expand its political base in the state.

Kerala, like Tamil Nadu, is a low tension area. The population of Kerala is evenly balanced, with nearly 20 per cent Christians, 20 per cent Muslims and 60 per cent Hindus. Among Hindus also are OBCs (ezhavas, etc) and SCs and STs. For this reason it is not a very communally sensitive area, but by no means is it free of communal tensions and occasional communal riots. Usually the riots take place between Hindus and Muslims but this time there were communal clashes between Muslims and Christians. Two persons were killed in these clashes between Muslim and Christian fishermen. According to *The Hindu*, "Two persons were killed and more than 100 houses set afire when two groups of fishermen clashed near the Vizhinjam harbour.... [on May 13, 1995]. A tense situation was prevailing in the area

after the incidents and police reinforcement have been rushed in". Two persons, Mail, Kannu (50) and Shahul Hamid (65) died in separate attacks in which country-bombs were hurled by mobs, the police said. The police had to fire in the air several times to disperse the mob. According to the police, the trouble started following an argument between two fishermen over the use of a common space meant for keeping fishing implements. The heated exchange soon took a violent turn, with rival sides using country bombs and swords against each other. A place of worship was damaged in the attack. Several boats and fishing implements worth several lakhs were destroyed, and more than 120 families were rendered homeless. The matter was serious enough to attract visits by members of the National Minorities Commission, which again created an uproar in the state assembly.

Phoolpur in Allahabad district, 40 kms from Allahabad, witnessed communal violence on June 12, 1995. One person was killed in this violent irruption and one was seriously injured. The infuriated mob set fire to several shops and stalls. The police found a large number of arms including country-made pistols and bombs. More than 90 persons were arrested. The cause of violence was the burning of religious books in the Ismailganj locality of Phoolpur.

Allahabad and Pratapgarh again came to the brink of communal violence on July 7, 1995. The tension built up on the recovery of the bodies of four Muslim girls. Twenty-two houses of Muslims were set ablaze in Pratapgarh district, and many Muslims ran away from their houses out of fear. The principal home secretary Harishchandra Gupta, however, claimed while talking to reporters that the situation was under control. Twenty-two houses of Muslims were burnt in Kundah Dilerganj village. Many Muslims were beaten up. It was rumoured that many girls are missing. Those girls whose dead bodies were recovered from the river Ganga were Rukhsana, Parveen, Nasrin and Seema. Three of them were from one family. The police had named 30 culprits but could arrest only eight of them. According to the authorities there was tension between Muslims and those belonging to the Maurya biradari. These incidents started with the murder of one Anisuddin. Thereafter a series of incidents of revenge and counter-revenge started, finally resulting in communal disturbances.

We next hear of communal incidents in Rankhandi town, seven kms from Deoband, the famous Islamic seminary town in UP, which broke out on June 29, hardly one-and-a-half-month after Mayavati took over as chief minister with the support of the BJP. The dispute was about the construction of a mosque in Rankhandi, which has a population of 15,000 of which about 1,000 are Muslims. As there was no central mosque they tried to build one. The Hindus of the village objected, and when they applied for permission it was granted only with some

conditions like not praying outside the mosque and not using loudspeakers. The Muslims, however, went ahead with construction of the mosque. A crowd collected and attacked and demolished it. The Muslims alleged that the police remained silent spectators. When the situation went out of control the police fired, killing one person and injuring many more. There was also an attempt to forcibly take away a Muslim girl but some secular Hindus prevented this at the risk of their own lives.

Qazi Rashid Masud, a leader of Mulayam Singh's Samajwadi Party, alleged that it was a mini-Babri incident and that the Mayawati government was trying to harass workers of the SP with the help of the BJP. He said that Mulayam Singh had fully controlled communal violence but that it is erupting again under the Mayawati government. The Kanpur, Phulpur and Rankhandi incidents are its proof, if any proof is required. However the redeeming feature was that the Rajputs in the village were very positive in their attitude and maintained that 'what is wrong if one mosque is constructed in the village? We have always lived in peace and harmony and we do not want any conflict'. However the village pradhan Sita Devi's attitude was unhelpful and he became instrumental in the demolition of the mosque.

These incidents clearly show that communal poison has gone very deep in the last few years and has penetrated to the village level also. If some local dispute about land arises, it takes on a communal form in no time. It is the constant communal propaganda for the last several years that has generated such a mind set.

Next we hear of communal violence in Palamau in Bihar, from the beginning of the first week of July. On July 10 the police discovered four bodies in a well which had been cut to pieces, allegedly of Muslims. About five persons were killed in all. The police force was reinforced in Palamau after these incidents. Hindus and Muslims had quarrelled over the issue of a boundary wall on cemetery land, the dispute was about including a tree within the boundary. When the contractor insisted on including the tree, a mob collected to protest and violence broke out. The police arrested eight persons. It is also true that chief ministers like Mulayam Singh Yadav or I. A. Prasad Yadav may be sincere in putting down communal violence, yet the local police and others may not have such thinking. That is why small incidents here and there do break out.

In Bihar, another incident took place in Qazi Bakri village of Manato thana in Daltangay district, in the second week of July, in which bombs were used. Three persons were badly injured, of which Bachchu Mahtu died on his way to hospital. Here too the dispute was about cemetery land. First the police tried to bring about a reconciliation between members of the two communities, but the understanding soon broke down and violence broke out. The

police arrested some Muslims, and about an hour after the arrest four Muslims returning from market were caught and their heads were bashed on stones, resulting in their deaths. Two others however escaped and broke the news in their village. The bodies of the four persons killed were subsequently found with the heads severed. The villagers wanted to set fire to the Muslim quarter but thanks to the S P Arvind Pande they were caught and further incidents were prevented. Thus in this case the S P played a very healthy role.

In Dilerganj 150 kms from UP communal clashes broke out between Hindus and Muslims. The two thakurs of the village, Uday Pratap Singh and his son Raghuraj Pratap Singh, are a law unto themselves and a terror in the village. The latter is also an MLC in the UP assembly. Raghuraj also known as chote sarkar, was allegedly involved in communal clashes on July 6 in which four Muslim girls lost their lives and over two dozen houses in Dilerganj village, all belonging to the minority community were razed to the ground. After the girls were killed their bodies were hacked to pieces and dumped in a nearby river. Why did the two thakurs make the Muslims their target? It is their way of dealing with anyone who opposes their supremacy (see *Sunday Calcutta* August 13/19/1995).

In Maharashtra there have been no major communal incidents since the Sena BJP government took over. According to a police official from Bombay, the SS BJP government does not want any communal incidents in Maharashtra. Perhaps it was not without significance that the former police commissioner Sahane worked diligently to maintain communal peace in Bombay, as his successor R. D. Tyagi. In Maharashtra there was only a small incident in Talegaon, about 24 kms from Nashik, on August 26 when villagers armed with lathis, iron rods and other lethal weapons raided a settlement of members of the minority community and assaulted the

inmates of the houses after breaking down doors and windows. More than 14 persons were injured in these communal clashes.

On the occasion of the Ganapati procession communal clashes occurred in Madras and Hyderabad in early September. The processionists pelted stones at the police when they urged them not to disturb prayers inside the mosque. In these clashes more than 100 persons were injured. The Hindu Munnani leader, however, alleged that Muslims disguised as Hindu were responsible.

However communal clashes in Hyderabad were much more serious on the occasion of the Ganapati procession. Two persons were killed. Here too violence erupted when the processionists stopped near a mosque in the Charminar area and refused to move. There was stone throwing and there are allegations and counter-allegations as to who started it. Twenty-one persons were injured in the incidents while a tourist bus and two scooters were burnt by unruly mobs. The two killed died in stabbing incidents. In subsequent incidents three more died bringing the total number of deaths to five.

In Shimoga in Karnataka there was case of stabbing during the Ganapati festival in which one person died. In Khandwa in MP the procession was stoned and the situation was tense, hence curfew had to be imposed to prevent further incidents.

In early December the situation was communally tense and security had to be beefed up in 13 districts of UP and the Babri masjid demolition day neared. Security had to be beefed up in Ayodhya, Varanasi, Mathura, Rampur, Sambhal town in Moradabad, Phulpur in Allahabad, Deoband in Saharanpur, Azamgarh, Aligarh, Kanpur, Bareilly, Lucknow and Meerut. According to intelligence reports, about two dozen people were killed and 100 injured in these districts up to October 1995. But on December 6 no major incidents occurred and the day passed off peacefully.

Women's Action Research and Legal Action for Women (Public Interest Advocacy Trust) requires a Programme Coordinator having a law degree preferably with feminist legal theory and women's studies. Practical experience of field work, research and publication. Capable of conducting seminars and legal literacy workshops. Capable of drawing up funding proposals and maintaining accounts.

WARLAW Programme Coordinator (Legal Editor) for publishing a journal on gender cases having a law degree preferably with feminist legal theory and women's studies with practical experience of field work, research and publication.

Salary depending on experience and qualification. Apply - Chairperson, **WARLAW**, Express Building, 9-10, Bahadurshah Zafar Marg, New Delhi 110 002.

Medicinal Plants: Poor Regulation Blocks Conservation

Arvind Kumar Jha

Weak and ill-defined legislation on conservation of medicinal plants, especially with regard to their exports, is allowing for a rapid depletion of rare species

CONSERVATION issues pertaining to medicinal plants are generally treated as part of overall biodiversity conservation strategy despite the fact that plant-based traditional medicinal systems is followed by four-fifth of human population. A large number of species used by indigenous people are yet to receive adequate attention of the formally educated people.

In India more than 1000 plant species are used in the traditional systems of medicine. Most of these plants and plant parts interestingly follow non-recommended and unrecorded routes to the ultimate consumer. As a result it is difficult to ascertain the exact levels of production, harvest and utilisation of such species. Very little information is available about the status of most of these individually unique resource elements in spite of their vital role in sustaining local health traditions that provide healthcare to majority of rural and tribal people of India.

Any long-term conservation strategy pertaining to natural resources essentially needs statutory support. Although peculiar legislation has not been enacted to cover specifically the medicinal plants in India the Indian Forest Act 1927, Wildlife (Protection) Act 1972 and Forest (Conservation) Act 1980 within the country coupled with Export-Import Policy (deal with the Customs Act 1986) on the foreign trade front provide regulatory mechanisms including specific scope for management intervention.

The regulatory provisions of the Indian Forest Act (IFA) apply to 'forest produce' which are classified into two categories. The first under section 2(4)(a) consists of items which are 'forest produce' irrespective of whether they are found in or brought out from a forest or not. It primarily includes as medicinal items bark, wood, oil and timber of medicinal species apart from rosha grass/oil and specific items like myrobolan and raulfith that have been included through various state amendments. The second category [section 2(4)(b)] also contains items which get termed as 'forest produce' only when they are found in or are brought from a forest. This category covers plants not being trees (including grass, creepers, reeds and moss) and all parts or produce of such plants and also includes leaves, flowers and fruits and all parts or produce of trees not mentioned in the first category. Most of the medicinal

plants and parts/produce come in this category. This implies that provisions of IFA apply to such material only when they are found in or brought from forest. Specific entries consequent to state amendments are as in the table. The Forest (Conservation) Act 1980 can be seen as a tool for restricting the diversion of existing *in situ* conservation areas and in a way facilitating protection of indigenous species of medicinal importance. It however regulates *ex situ* conservation efforts by defining monoculture plantations of non-indigenous medicinal species on forest lands, as activity with 'non-forestry purpose'. Taking up such plantations in forest land requires prior permission of government of India.

The Wildlife (Protection) Act 1972 (WPA) was amended in 1991 introducing a chapter on protection of specified plants listed in the scheduled VI of the Act. At present there are six such species viz kuth, Blue vanda, Red vanda, Cycas beddomei, Pitcher plant, and Lady slipper orchid. Of these kuth is important from a medicinal point of view and is also contained in the appendix I of the Convention on International Trade in Endangered Species (CITES) of wild flora and fauna. The WPA contains regulatory provisions in regard to all vegetation existing in sanctuary and national parks (PA's). Outside PA's however the act basically provides for regulatory mechanism for 'wild-animals' and the six species listed in schedule VI. In short the WPA suffers from limitations of scope as well as applicability in regard to medicinal species.

The Export-Import Policy of India directs that the export as well as import of plants

and plant parts shall be subject to the provisions of CITES. The appendix I of CITES contains the six species indicated in schedule VI of WPA while appendix II contains just 12 items of Indian flora, some of them indicating complete genera. The EXIM Policy, operating through negative lists, prohibits export of all plants included in appendix I of CITES. Wild orchids and also 46 items of plants, plant portions and their derivatives indicated in Public Notice No. 47 dated March 30, 1994. Almost all the 12 species covered by this public notice have medicinal use. In addition, export points for plant parts/produce obtained from Wild are restricted by the policy to five major ports viz Bombay, Delhi, Madras, Calcutta and Cochin to ensure effective checking and control. The schedule to Agricultural and Processed Food Products Export Development Authority Act also contains some specified medicinal plant species basically for promotion and regulation of export of such material. Considering the above aspect related to international trade, it is clear that a significant number of medicinal species are under various types of regulations on the export-import front. The basic criterion for imposing regulations is the current status of the species and not their medicinal value *per se*. Such an approach has led to generalisations in terms of total ban on certain species and has also in a way precluded the strategies of development of conservation planning in respect of species used in life saving drug formulations at the global level.

The legal support system in respect of medicinal plant conservation has conspicuous gaps. There is virtually no control on exploitation and removal of such material from areas outside PA's. The movement as well as trade in such species, some of which are endangered enough to find a place in the list of banned species for export, is without any controls. This apart from obscuring the details of local trade creates problems at the export points leading to outright smuggling as also misdeclarations. There is a total lack of recognised labs in adequate number for quick identification of plant parts and products with due statutory back-up. This leads to situations of delayed clearances as well as give scope for export/import of banned species.

In short, an integrated legislation with medicinal plant conservation as its basic thrust is the need of the hour. Such legislation should cover various aspects of *in situ* conservation, organisational strengthening or enforcement of the same, issues related to intellectual property rights, rights of producer, research back-up and reward system for traditional knowledge and skills. Further, dovetailing its prescriptions with the existing statutory provisions is also a must in order to maintain a sustained support to the medicinal plant conservation programmes on a long-term basis.

TABLE: MEDICINAL SPECIES INCLUDED IN SECTION II, STATE AMENDMENTS 2(4)(a)

State	Species
Gujarat	<i>Rauwolfia serpentina</i> , Kadaya gum
Maharashtra	Rosha grass including oil <i>Rauwolfia serpentina</i>
Karnataka	Sandalwood, oil, rosha grass and oil, <i>Phyllanthus emblica</i> , <i>Terminalia chabula</i> , <i>Terminalia bellarica</i> , <i>Capparis racem</i>
Tamil Nadu	Sandalwood
Kerala	Gum, fibres and roots of Sandalwood and rosewood
Orissa	Gums, roots of Patal garudi
UP	Sandalwood, Tamarind, Gum Chiranjee

Bhopal Gas Victims

Dismal Disbursal of Compensation

Satinath Sarangi

Government's compensation to Bhopal gas victims is inadequate and based on underassessment of injuries. Further, lack of proper procedures and delay in disbursal of the amount has encouraged corruption

THE Supreme Court (SC) has appointed a committee to look into the issue of inadequacy of compensation being awarded to the Bhopal gas claimants. The inadequacy of compensation awarded to individual claimants is but a consequence of the inadequacy of the settlement amount. The government of India (GOI) is *parens patriae* of the Bhopal victims who had claimed a sum upward of US \$ 3 billion for personal and other damages caused by the disaster. However in 1989 the GOI without the consent of the claimants it represented absolved through a settlement Union Carbide of all past, present and future liabilities arising from the disaster for a pitiful sum of US \$ 470 million. The apex court in its wisdom and in the interest of the gas victims, sanctified this settlement with a judgment to this effect. The revised judgment passed on October 3, 1991 upheld the settlement amount paid by Union Carbide. However, in the revised judgment the court directed the government of India to make good any shortfall in compensation. It unfortunately left out directions towards complete registration of claimants, proper assessment of injuries and determination of adequate compensation. These vital omissions have led to much arbitrariness and illegality by the government in its triple role of plaintiff, defendant and judge on the matter of compensation disbursal.

It needs to be kept in mind that the Supreme Court did not have sufficient data before itself to judge the adequacy of the settlement amount. As stated in the clarificatory order of May 1989 calculations for compensations for the settlement had been reached viz fatal cases 3,000, permanent total and partial disability 30,000, temporary total or partial disability at 20,000 and minor injuries at 50,000. It was made clear in the order that the basis for arriving at the figure of 30,000 permanent total and partial disability was not on any epidemiological evidence. In October 1991 when the final judgment was passed almost half the claimants had not been medically examined and the number of deaths attributable to exposure was placed at 3,828. According to data from the office of the welfare commissioner, Bhopal gas victims, October 14, 1995 the official death toll has nearly doubled (7,575). Surely the SC needs to be better informed regarding the nature and

extent of damages caused by the Union Carbide disaster.

The government's failure in protecting the legal rights of the gas victims is evident from the fact that close to five years after the disaster the registration of claimants is far from complete. According to official figures in 1995 97,306 claims have been registered with the directorate of claims, Madhya Pradesh government. Of the 4,06,095 claims have been filed by the residents of the 36 wards and the figure is 27 per cent less than the official resident population of these wards in 1984. The single largest omission is the non-registration of claims of over 1,50,000 gas affected persons who were less than 18 years age at the time of registration of claims. Such a situation has been brought about primarily due to the arbitrary decision of the government officials in charge of claim registration to disallow persons under 18 to register their claims. This illegal practice was carried out under the erroneous notion that since minors cannot be owners of property they cannot be entitled to compensation amounts. It is to be noted that the Supreme Court has through its August 1992 order on interim monetary relief payments acknowledged the legal entitlement of minors who claimants have not been registered. The other large omission is that of non-registration of claims of children born to gas exposed parents subsequent to the disaster. Studies conducted by the Indian Council of Medical Research (ICMR) have reported that physical and mental growth of such children have been significantly affected and there is significantly longer delay in gross motor (control of voluntary body movements) and language sector development. A 1990 study by ICMR also shows chromosomal aberrations in an abnormally large population of gas exposed people indicating possibility of congenital malformations. Autopsy reports of deceased post disaster children as late as 1987 indicate the presence of gas related organ damages similar to other gas victims. Possibly keeping such scientific observations in view, the final judgment of the Supreme Court contains provisions for later born children who might manifest congenital or pre-natal MIC related afflictions. Yet in Bhopal where with a birth rate of 29 per 1,000, an estimated 1,50,000 children have been born to the

residents officially recognised as gas affected, not a single claim has been registered on behalf of a post disaster child.

The injuries caused by the disaster have been under assessed. According to the categorisation figures presented by the directorate of claims only 8 per cent of the claimants (who had been medically examined) suffered serious injuries due to the disaster. In all 45 per cent of the claimants were reported to have suffered no injuries and only 40 persons were found to have suffered total disability. These figures are in sharp contradiction to those presented by the ICMR according to which 100 per cent of the Union Carbide factory cross died to the blood stream of those exposed claimants due to the lungs, brain, kidney, muscles as well as destruction of reproductive and immune systems. ICMR has reported that 90 per cent of the population of 80,000 of the ICMR study report suffer a variety of injuries of permanent nature as a result of the disaster. In addition there are about 100 physical and mental injuries that have been documented by ICMR which is also reported to have led to a decrease in the exposure related consequences with time, the symptomatic population is actually growing further with the passage of years. ICMR too has witnessed times more people suffering from respiratory problems in 1991 compared to 1987.

The unscientific methodology that was deliberately followed by the directorate of claims resulting in ridiculous results has made the government vulnerable to popular criticism that the injuries have been allowed to suit the small size of the settlement. A study sponsored by the centre for social medicine, Jawahar Lal Nehru University, New Delhi in December 1989 has reported that the three most essential medical investigations viz pulmonary function test, ophthalmic test and exercise tolerance test have been carried out on less than 18 per cent of those examined. The study also pointed out serious errors in the method of counting injuries and the omission of psychiatric injury evaluation. Despite severe criticism by medical professionals, activist groups and survivors organisations, the government's medical categorisation and its absurd findings have come to be the sole criterion for allocation of compensation. Particularly after June 1994 when a ban was imposed by the then welfare commissioners, such a flawed criteria has resulted in gross injustice in the 1,73,239 injury cases that were decided subsequently.

FAULTY COMPENSATION

The average compensation amounts awarded for personal injuries to residents of different wards show the degree of injustice done in the disbursal of compensation (Table 1).

The following are evident from the data given in Table 1

(i) The maximum average compensation has not been awarded in ward nos 13 and 20 the wards nearest to the Carbide factory and those found to be severely affected by the ICMR. The maximum average compensation has been paid in ward no 21 a ward categorised by the ICMR as mildly affected and more than two kilometres away from the factory. This fact alone demonstrates the absurdity in the compensation disbursement in Bhopal and casts serious doubt on the performance of concerned officials and agencies.

(ii) Even if one takes the much flawed government's medical categorisation as the basis, the apparent discrimination against residents of ward nos 13 and 20 remains to be explained. As per the categorisation figures the number of claimants in permanent and more severe injury categories in ward nos 13, 20 and 21 are 852, 1,227 and 626 respectively.

(iii) The difference between the lowest and the high average compensation in different wards is only Rs 8,483. As per the government guidelines issued to the welfare commissioner on April 13, 1992 the range between which injuries were to be compensated is Rs 25,000 to Rs 4,00,000. The average compensation awarded to a claimant for personal injury in Bhopal is Rs 26,531 which shows that an overwhelming number of claimants have been paid the minimum compensation as per the government guidelines. As the table shows, in ward nos 4, 30, 48, 53 and 54 the average compensation equals to minimum compensation and in ward nos 1, 24, 26, 38, 39 and 40 the average compensation awarded is less than the minimum compensation.

Such absurdities are also noticeable in the compensation figures for death claims. The following points emerge from the data in Table 2.

(i) It has been officially acknowledged that the number of deaths attributable to the disaster is 1,575. This is almost double of the death figure (3,828) presented before the SC prior to the final judgment.

(ii) The judicial officials have rejected 43.3 per cent of the death claim cases. It needs to be pointed out that in a significantly large number of cases deaths that were recognised as exposure related by the medical experts committee set up by the government were held to be otherwise by the claim commissioners. The primary reason behind such rejections is the near total ignorance of the claim commissioners regarding the medical consequences of exposure to the poisonous gases.

(iii) The average compensations paid in death claim cases is Rs 73,638. Given that the number of cases converted to personal injury cases is small (1.8 per cent) it is obvious that in a significantly large number

of cases the compensation paid for death has been less than the minimum (Rs 1,00,000) stipulated by the government through its guidelines.

(iv) The difference between the lowest and highest compensation amount is very large (Rs 83,305).

It is also crucial to note that the Bhopal claimants are not being paid any interest on the compensation sums payable to them nor are any adjustments made against inflation. According to established norms in tort cases, claimants are entitled to receive interest on compensation from the date of registration of claim to the date of resolution of the claim. Inflation being taken into consideration, the estimated sums of compensation need to be upwardly revised by more than two times

from what they were at the time of settlement. Denial of interest is another blatant injustice being done to the claimants of Bhopal.

The absence of guidelines and procedures for adjudication of compensation has given to rampant corruption in the disbursement of compensation. Vulnerability to abuse being inherent in the system, there is now an ancillary service industry of graft in Bhopal that thrives on the inadequacies of compensation disbursement. With time corruption has become systemic and well organised so as to become the norm rather than an aberration. Claimants are forced to pay bribes to judicial officials, doctors and employees at the claim tribunals to obtain what they are legally entitled. Table 3 gives the current grant rate for different services.

TABLE 1. AVERAGE COMPENSATION IN DIFFERENT WARDS

Location	ICMR Categorisation	Ward No	Average Compensation Awarded (Rs)	Deviation From Mean
Close to Union Carbide Factory	Severely affected	13	30,371	+3839.8
		20	27,443	+911.8
Farther from Carbide Factory	Moderately affected	8	25,727	804.2

		04	25,000	-1531.2

Source: Office of the welfare commissioner, Bhopal gas victims, September 14, 1995.

The response of the welfare commissioner to charges of widespread corruption has been that they do not have a single proven case of wrongdoing in this respect. Thousands of survivors, however, would be prepared to speak on oath if required, about the bribes they were forced to pay. Failure to pay bribes have resulted in lowering of compensation

amount, delay and occasionally rejection of a case.

In addition to arbitrariness, injustice and corruption, delay in disbursement is another major problem that ails the disbursement of compensation in Bhopal. Data from the welfare commissioner's office from January 7, 1994 to October 14, 1995 demonstrate that the

average rate of disposal of cases this year is 386 per day. Also significant is the rate of actual payment of compensation which is 327 per day. At this rate, it will be another 698 days or two years for the remaining cases to be disposed of. If we add the time it will take for the disposal of 1000 cases, it will be 1000 days or 2.7 years. It is clear that at the current rate, the burden of compensation to all Bhopal gas victims will not be met for a century. Will not be met for a century, the demand of justice for the victims of the century will not be met.

Lok Adalat for compensation claims have been conducted in February 1995 to cope with the problem of delay. However, the injustice done in the interim mode has assumed second proportion at this point. The welfare commissioner's decision to award compensation of Rs 10000 to a claimant decided in a Lok Adalat. In the drive to get thousands of cases adjudicated in one day, each claimant is given less than an average two minutes to present his case before the judicial official. Also, the hearing of cases in the Lok Adalat is conditional to the claimant's consent to the award before she even knows what amount to be awarded. A sample of the blind nature of the form is appended.

Appeals against inadequate sums of compensation taken on time to be finalised and are often rejected without proper hearing. If such delays were not to discourage a claimant wishing to seek redress against inadequate compensation, the possible consequence would militate against such a recourse. Figures available from the welfare commissioner's office show that the total decrement in compensation amount is result of appeal in one readily higher Rs 81,68,657 on July 31, 1995 to Rs 1,192,007 in October 14, 1995. These figures demonstrate that claimant's appeal for enhancement of compensation have not only been largely rejected but where a claim has been

revised *suo-motu* and the sum of payable compensation has been reduced. The delays in, and unfavourable consequences of appeals carry an ominous and coercive message to the claimants—accept whatever is being decided or face a lingering and unfavourable consequence.

According to official figures of October 14, 1995 (see Table 4) more than half (52 per cent) the appeal cases have been unfavourably decided against the appellant and 41 per cent have been only partially in favour. Small wonder then that appeals are being filed by less than 1 per cent of the claimants who have suffered personal injury.

The foregoing discussions situate the issue of adequate compensation awards in the context of the origins of the problems, the nature and content of injustice being done to the claimants and the systemic coercion that perpetuates this injustice. Any concern directed at remedying the above described dismal situation has to reckon with the unprecedented nature and magnitude of the problem to be able to suggest a just and humanitarian solution to the problems of compensation disbursement in Bhopal. It is imperative that some of the basic issues raised in this submission be addressed in offering a remedy.

Demographic Transition and Education in Kerala

KS James

Between 1990 and 1993 the Kerala government closed down several 'uneconomic' schools where the student strength had gone down abysmally. This sparked off a controversy at the academic and political levels and has focused attention on the impact of the demographic transition on the education sector.

EVERY transition process has its effects and consequences. The demographic transition which signifies a long term decline in the fertility and mortality parameters is not an exception to this rule. There will be an expected change in the age structure of the population and the consequent increase in the old age population. Due to the burgeoning of people in the later age groups the priorities in the health sector, social welfare sector, educational sector, etc., need to be altered.

No one would, however, expect the demographic transition to generate so much of controversy and interest in the educational sector as in the case of Kerala. Even the demographic transition process in the state itself is cited as a paradox as it occurred without adequate economic backing exceptional to the experience of many western countries. Questioning the expenditure on education Mari Bhat and Irudaya Rajan (1990) remarked that 'As a result of past decline in fertility, when there was no growth in the population in school going ages during the 1970s and 1980s, more and more money was pumped into the educational sector. As enrolment rates were already high by 1970s in primary and secondary level, the increase in expenditure hardly produced any further changes in enrolment rates. Between 1961 and 1987 the population in the age interval 5-14 increased by 30 per cent. But during the same period the real expenditure in education increased by more than 300 per

cent. Can such changes be justified through the increase in enrolment? Thus, the closing down of schools at the primary level on the grounds that they were uneconomic has sparked off controversies both at the academic and political decision making level.

During the period 1990-93 the government has closed down nearly 67 uneconomic schools in which the strength of students was abysmally low according to the survey conducted by Directorate of Public Instruction. There was also recommendation to close down another 89 schools with effective strength less than 50 students in 1993-94. The rationality behind the closing down of the schools are taken on a justifiable ground according to the government. How did then, it create so much of interest in the state? In what follows we give an account of the effects of demographic transition on the educational sector in Kerala, mainly focusing on a recently submitted report on the educational sector in the state by an expert committee constituted by the State Planning Board. (The expert committee comprised Harichandran of State Planning Board, R Ramkumar of Department of Demography and Population Studies, University of Kerala and S Irudaya Rajan of Centre for Development Studies.)

DEMOGRAPHIC PROJECTION

The accuracy of a population projection primarily hinges on the assumed level of

future fertility, mortality and migration. As the projection output entirely depends upon the assumed value of these parameters in the future, the final total tends to vary from different projections based on the assumption. With a very low level of infant and child mortality in Kerala, the assumed level of fertility rate becomes all the more crucial in the estimates of future school going population. Generally two arguments tend to prevail in the assumption of fertility level. The SRS estimates of total fertility level in Kerala are already at a lower level (less than replacement level) and therefore it is argued that further reduction in this rate is quite unlikely. Also some of the experience of the western countries indicate that the fertility level has gone up from a below replacement level to slightly over two where it is being stabilised. Therefore, in the case of Kerala either there can be an increase in the fertility level in the future so as to stabilise population at a particular level. Consequently the future assumption on the projection should be based on this premise assuming a fertility rate higher than that of today.

At the same time, unlike the western countries, the state also presents an uneven level of fertility among the districts and also in some pockets. There are also districts like Malappuram with fertility level much higher than that of state average. Hence it is being argued that the fertility level may further go down as the transition accentuates in these districts and in some of the high fertility pockets. Due to these differences in the assumption the future level of predicted population figures is also different. It is in this context that Planning Board constituted an expert committee to understand the consequences of demographic transition on the future (by 2001 AD) as well as on the present educational sector.

The death rate in Kerala is already at a low level and therefore further drastic declines in mortality is ruled out. Consequently the future population growth will primarily depend upon the change in the fertility level of the state. Hence the assumption on future fertility would determine the net addition to the population by 2001 AD.

TABLE 1. ESTIMATED/PROJECTED SCHOOL AGE GROUP CHILDREN BY SINGLE AGES IN 2001 AD, KERALA

Ages	Population in 2001 AD
5	527617
6	528589
7	530315
8	531194
9	532056
10	534988
11	531653
12	526072
13	525440
14	524060
Total	5291920

The expert committee has made a fresh attempt to estimate/project the school age group (5-14) population by 2001 AD. As most of the school age group population in 2001 AD was already born, the attempt was to estimate the number of survivors among them. The survivors of those born during 1986-95 will be 5-14 age in 2001. Therefore, the projection of the population has been carried out only for 1994-95 years based on linear fertility decline assumption of the two years preceding 1994.

It is estimated that the school age group population (5-14) will decline to 52.92 lakhs in 2001 AD from the present level of 58.68 lakhs enrolment in 1997-93 with a net decline of 5.76 lakhs. At the lower primary (LP) level (5-8 years old), the population would be 17 lakhs as against the present enrolment of 23.71 lakhs students. At upper primary (UP) level the decline will be from 19.07 to 15.98 and at high school (HS) level from 15.89 to 15.75 during the same period. The taluk level estimation also indicate that the school age population will be highest in Ernad taluk in Malappuram district and lowest in Kothamangalam taluk of Ernakulam district. As the fertility level in Malappuram is comparatively higher than other districts in Kerala, the highest number of school age population at Ernad taluk is not of a surprise.

The other major findings revealed through the estimates are: (1) there is a decline in the school age population at all the three stages in almost all the taluks of the state. (2) The decline is minimum in northern taluks of the state and maximum in taluks where family welfare programme has been intense like Mappuzha or Ernakulam. (3) The school age population is maximum at age 10. The total school age population would decline faster and the number of students appearing for the SSLC will also start decreasing. The declining wave will reach college later on. The distribution of estimated population for single year from age 5-14 is given in Table 1. The table clearly indicated that up to age 10 the number of people in each age group is higher than the earlier age group.

This shows that there is lowering of births in recent times. However, the trend was different earlier. As a result of the between age 10-14, the age pyramid would show the usual high fertility pattern. The projected future before age 10 is an indication that the number of students will be fewer in the coming years. Once this wave moves on to other age group beyond 14, a decline in the college population is also quite likely.

PRESENT SCENARIO

It is true that Kerala has a definite advantage as far as the education is concerned even much before the attainment of the independence. As such, the literacy rate in

the state has been higher than that of India or any other states in the country even earlier. After independence, the educational infrastructure in the state made a rapid increase particularly during the period 1961-62 through 1982-83. The total number of schools have gone up from 9,459 in 1961-62 to 11,734 in 1982-83 of which 2,154 are high schools (HS), 885 are UP schools and 6,817 LP schools. By 1992-93 period the total number of schools are 12,152 of which 2,472 are high school, 2,931 are UP schools and 6,779 are LP schools. In other words, the number of LP schools has registered a decline to 1,400 during the period 1982-83 through 1992-93. The Table 2 gives the number of schools in different sectors under different sector in different time periods.

It can be noted from the table that there is a decline in the LP schools both in the private aided sector and government sector while the number of schools in unaided sector has registered an increase. Two arguments can be mainly put forward for this phenomenon. It is argued that coupled with the falling birth rate, the quest for westernised type of education among the Kerala led to the increase in the unaided sector and consequent fall in the other sectors of education. Another argument is against the policy of the government towards granting more unaided schools other than trying to improve the quality of education in the existing government and private aided sector. A quick look at the data, however, does not suggest any abnormal increase in the number of schools in the unaided sector. It is increased marginally between 1984-85 and 1993-94. Therefore, the cause for decrease in the government and private aided schools cannot solely be attributed to the increase in the number of unaided schools. This will become more clear by looking at the enrolment of the students in different sectors (Table 3).

It is true that the enrolment at the unaided sector has increased after between 1973-93 particularly in the LP level. The enrolment at LP level has marked a 55.51 lakh decline during the period 1973-93. The enrolment at LP level stood at 23.71 lakh in 1993 as against 29.26 lakhs in 1973. 17.40 lakhs in 1983. The enrolment in unaided by 2000 students every year in unaided sector, however, the enrolment at LP level increased from 0.58 lakh in 1973 to 0.79 lakhs in 1993. However, should be noted that the enrolment in the private aided sector at LP level stood at 1.19 lakhs in 1993. A consistent decline in the enrolment during 1980s is recorded from the government school and private aided schools.

At the UP level although there is an increase in the actual number of enrolment, the pace of increase was very slow in the UP level and almost no enrolment increase between 1985-93. The enrolment in the UP level stood at 18.89 lakhs in 1985 and increased to 18.89 lakh in 1993. In the government school, the enrolment increased from 6.14 lakh in 1973 to 5.23 lakh in 1993 and 6.94 lakh in 1995. While in the private aided school, it is 4.85 lakhs in 1985 to 9.15 lakhs in 1995.

Enrolment in different sectors

Among the 1,000 schools in Kerala, 59.43 per cent are in the government schools, 37 per cent in government aided and 3 per cent in unaided schools. In the government sector there has been a sharp decline in the LP school which fell from 30.52 in 1990-92 to 17.57 in 1993. The number of teachers at the LP level in government schools is almost reduced during 1980-92 period and at high school level which increased from 1,290 in 1971 to 2,790 in 1991 and 3,706 in 1993. Number of pupils at each record is declining trend set up in school. It is

	Government			Private Aided			Unaided		
	LP	UP	HS	LP	UP	HS	LP	UP	HS
1973	1278782	168371	262585	1611763	871428	485555	18038	10580	9882
1983	1089002	613394	522471	1430541	1119135	775530	20197	20670	17335
1993	9464955	674667	639532	1346165	1186376	915580	29425	46281	36015

33.8 in 1970-71 declined to 32.1 during 1980-81 and further to 30.9 during 1992-93.

On account of this the number of protected teachers becomes a mounting problem to be solved from the part of the government. As per government order teachers appointed in regular vacancies with five or more years of continuous service are eligible for protection. This facility has become extended to non-teaching staff too in 1970. The number of protected teachers in 1983 was 4,350. However, its number has declined to 2,011 in 1993. Out of this 1,172 are in primary school teachers. It is to be noted that all the protected teachers are in private aided schools.

If the minimum strength of students per standard is less than 25, the school will be considered as uneconomic. For Sanskrit and Arabic school the minimum strength needed is 15 per standard. Of the 1,289 uneconomic schools in the state, nearly 89 per cent are LP schools (1,153). Majority of uneconomic schools are in private aided sector (798) and 491 in government sector. Of the 1,159 LP uneconomic schools, 496 schools had the effective strength between 75 and 99, another 435 between 50 and 74 and 92 schools had the effective strength of below 50.

The forging discussion reveals the fact that there are surplus schools and teachers at least in the LP school level in Kerala at present and likely to increase further in the future. What are the implications of dwindling school age population in Kerala in the educational sector? Whatever be the assumption used for the future projection, there is unanimity regarding the decline of school age population in the state by 2001, although there is disagreement regarding the magnitude of decline. The expert committee has predicted a net decline of 5.76 lakhs by the year 2001 AD. This figure seems to be accurate compared to usual projection as it is mainly estimated from the already born children without any fertility assumption except for two years.

The expert committee also noted that the enrolment in the primary stage thus had reached a saturation point around mid-1980s. Therefore, in the near future this trend will spread to upper primary and high school and later to the college level. This is because at present about 75 per cent of the respective age group population get enrolled in standard X. Even assuming that this percentage could be made to go up to 80, the number of children enrolled in 2001 AD in standard X will be 4.19 lakhs, that is less than the present enrolment of 4.34 lakhs. According to the expert committee even at the plus two educational level, there is an abundance of educational infrastructure in the state. Therefore, rather than the expansion of infrastructure, restructuring of the existing facilities are necessary in this direction.

Another suggestion is towards reducing the number of teachers training institutes like BEd centres and teachers training centres (TTC) as there are surplus teachers already in the state. However, further training to teachers such as refresher courses, reorientation programmes and teaching in subjects like computer education, basic electronics etc. will have to find place in the curriculum of the 21st century.

As several schools are already been closed and several class rooms remain vacant, these existing buildings can be utilised for alternative purposes. Further, new construction of building for the school has to be done only on a selective and priority basis so that the saving that could be so derived can be re-invested for bettering the amenities and facilities such as providing drinking water, toilet facilities etc.

As already mentioned, there are 2,011 protected teachers in 1993, all in private aided sector, of which 1,172 are in primary schools. Roughly it cost a total drain on the exchequer amounts to over Rs 7 crore. These protected teachers can be utilised for improving the quality of education with tutorial system or remedial education. In addition, there is also problem of uneconomic schools where the problem of surplus teachers exists. In the coming years, as the percentage of the population in the school age group goes down, this problem is likely to get worsen. Therefore, a mechanism has to be evolved to absorb the protected teachers in the private sector in school where teachers are needed.

Currently, there are nearly 1.9 lakh teachers in Kerala with a teacher-pupil ratio of 1:30.9, while for all India the ratio is 1:34. Out of this 1.85 lakh teachers are in the government and aided sector with 57.07 lakh students. Assuming current level of enrolment in the unaided private sector in the near future, the likely enrolment in the government and private aided sector together will be 46.71 lakhs. Even to maintain the present level of teacher-pupil ratio (1:30), the number of teachers required will be only 46.71 lakhs, indicating a surplus of 25,000 teachers in the state. Therefore, unless some serious policy measures are undertaken, the situation will become explosive and frustrating for the teaching community as a whole. The drain of resources from the government exchequer will be approximately Rs 90 crore per year.

The report suggests that Kerala is slowly moving towards a self-financing educational model. Due to the economic buoyancy of the sizeable segment of the population, parents are ready to give their children the best training and make the best investment possible. Even though this conclusion cannot directly derive from the above analysis, the committee felt that the enrolment of children in private unaided schools is bound to increase due to liberal provision in the Kerala Educational

Rules as well as the affordability of parents. Therefore, unless the old institutions accommodate new changes and challenges to provide better facilities, the existence of these institutions in the long run will be at stake.

To conclude, the falling birth rate in Kerala definitely has an impact on the education sector as the number of school-going population in the state is dwindling. Therefore, the number of schools and teachers are likely to be surplus in the coming years. However, the closing down of the schools is to be undertaken with caution looking at the socio-economic background of the place and not just the number of students in a school *per se*. The argument that the problem of uneconomic schools is caused by the large expansion of unaided schools does not seem to be valid in the case of Kerala. As parents desire quality education in the state, ever shouldering higher costs, the greatest task ahead of the government would be to improve the quality of the existing institution.

China: Planning the Future

Yi Ren

Past success has understandably injected optimism into China's long-term planning, as reflected in the drafts of the ninth five-year plan and the second long-term plan recently unveiled by Chinese planners. But past record is no guarantee of future performance

CHINA has recently unveiled drafts of its ninth five-year plan and its second long-term plan. The economy is set to take on a course of further high growth up to 2010.

In an era of uncertainty and underachievement, the Chinese planners are in an envious position: they have had the rare satisfaction of seeing the target of the first long-term plan fulfilled five years ahead of schedule. Initiated in 1980, it was to quadruple the total value of GNP in 20 years (which implies an annual growth rate of nearly 7.2 percent, not at all a mean feat by international standards). In reality, however, in the last 17 years since 1979, GDP has grown by 9.8 percent per annum. As a result, the target will be reached before the end of 1995. Thus the Chinese government is able to upgrade its objective for the year 2000 to offset the impact of population growth: the revised target now is that per capita income in the year 2000 should be four times as high as in 1980.

The success in the past has understandably injected optimism into China's long-term planning for the years up to 2010. The proposed target is to double the size of GNP again in the 10 years between 2000 and 2010 (which would require an annual growth rate of about 7.2 percent). If this is realised in time, of which the planners are apparently confident in the light of past experience, China would have joined the ranks of the most outstanding economic performers such as Japan and the four Asian Tigers, all of who succeeded in sustaining high growth rates over extended periods of time (25-30 years).

But past record is no guarantee for future performance. China is certainly facing a more difficult task than it did in 1980. The success of China's economy in the past has depended on several factors, whose potential for further effect is however likely to decline.

(1) Rapid rural industrialisation, during which a large number of previously agricultural labours took up manufacturing employment, resulting in substantial gain in level of overall productivity. But further growth in the rural industrial sector is constrained now by its relatively small-sized plants, lower level of technology, environmental problems as well as tougher competition.

(2) Implementation of a regional strategy which boosted the comparative advantages of

the more developed coastal areas. This policy has however resulted in a widening regional gap and prompted fear for China's disintegration. It is therefore politically unsustainable. In fact, the central government has committed itself to reducing this gap during the period under planning.

(3) Reform in the inter-government relationship, which created effective institutional incentives for widespread local government-led economic development. But it has also given rise to localism and administrative corruption. The temptation for greater control has already encouraged the central government to adopt tighter fiscal and administrative measures, which are likely to reduce the incentives.

(4) Significant progress in export promotion and success in attracting inward foreign investment. With rising protectionism and increasing competition in the international market, however, further progress in these areas is far from assured.

On the other hand, the economy is facing a number of serious problems. Among them, some are new, while others are those that past reforms have failed to overcome. Partly as a result of the single-minded pursuit for industrial development by the government in the past decade and a half, agricultural development has been neglected and has stagnated since the mid-1980s. Various sources of study have confirmed that China will have to make a major effort to merely meet its own need for grain in the next 15 years. According to China's own estimates, on present trends, China will experience a shortfall of 65 million tons of grain by the year 2010, while the estimate of the Worldwatch Institute puts the shortfall at 156 million tons.

Second, despite past emphasis on reform in the state sector, China's state-owned

enterprises, which make up some 60 percent of the nation's industrial capacity, still lack dynamism, with only a third making profits. Any progress in this sector is likely to be slow, given that the state is apparently apprehensive of the political implications that a programme of large-scale privatisation would entail.

Third, rising inflation has become a persistent feature of the economy, associated with budgetary deficit for the central government. The need to keep inflation under control is likely to induce the government to impose a credit squeeze from time to time, undermining the prospect of a steady high growth rate. On the other hand, the shortage of budgetary revenue will constrain the centre's ability to develop the massive infrastructural capacities that are needed for the further development of the national economy.

Fourth, the economy as a whole remains inefficient and is characterised by widespread waste. Unless the current mode of the economy can be transformed with greater contribution from technical progress, there would be major resource constraints on the realisation of the growth target.

Fifth, with a huge population base, pressure on resources and employment opportunities is bound to increase. The current planning target for population growth is to limit the increase to 100 million between 2000 and 2010, which requires the annual population growth rate to be controlled under eight persons per thousand population. Given that in the past 17 years since 1979, when massive government efforts of population control through its one-child policy provoked widespread resentment at home and accusation of human right violation abroad, the population still grew by 14 persons per thousand a year, the task for the future looks extremely tough.

Finally, the growth of material wealth and rising tide of consumerism and commercialism have given rise to what some called collective corruption, by which is meant that everyone except the farmer has engaged in corrupt behaviour of some form or another, which reflects a fundamental disinterest in collective goals or national interest. The upshot is that a large section of the Chinese population is no longer prepared to work as hard as in the past.

For the Attention of Authors

The compulsion to limit the size of issues on account of steeply rising newspaper and other costs and a sizeable backlog of material awaiting publication lead us to request that papers submitted for publication be not over 10,000 words, including tables and notes and references.

It is helpful if contributions in word-processed format are accompanied by floppy disc copies, in Wordstar preferably. The latter will be returned after use.

Common Property Resources and the Environmental Context

Role of Biophysical versus Social Stresses

N S Jodha

This paper deals with common property resources (CPRs) as a part of societal responses to high risk low productivity environment in the dry regions of India and the decline of CPRs under changing social and institutional circumstances despite their unchanged bio-physical contexts leading to degradation of a community asset and erosion of environment-friendly survival options for the people

I Introduction

RURAL common property resources (or rather common property regimes) (CPRs) are institutional arrangements evolved by communities to collectively manage and use their natural resources. In dry tropical areas of India (and in other dry regions) they also formed a part of rural people's strategies for adjusting to the harsh and stressful environmental conditions [Berkes et al 1989, Bromley and Cernea 1989]. Historically speaking, in such areas CPRs may be treated as product of the stressed environment. However, under the changing circumstances in dry tropics of India, despite persistence of bio-physical stresses, CPRs are rapidly declining. This has happened due to several changes accompanying the process of rural transformation which have marginalised the role and utility of CPRs in the rural economy and have eroded the social and institutional framework that ensured protection and regulated use of CPRs as community assets. Thus, the man-made circumstances dis-favouring CPRs have acquired primacy over the bio-physical conditions that favoured CPRs. In the broader context, this may amount to a disregard of ecological and environmental imperatives by focusing on short term considerations. The present paper based on a detailed study of CPRs in dry tropics of India illustrates the above phenomenon.

The paper draws on the household and village level data collected during the field work over a period of three years from over 80 villages in 20 districts scattered in six dry tropical states of India (see Map). Methodological and other details are reported elsewhere [Jodha 1986, 1992]. This paper analyses the field level information the focus being on the changing nature of stresses and the consequent changes in the status of CPRs in the dry regions of India.

In Section II we present a generalised picture of environmental features of dry regions that historically favoured the institution of CPRs. This understanding is reinforced by the comparison of situation of CPRs in areas with higher and lower degree of environmental stresses. Section III, briefly comments on the persistent utility of CPRs and people's dependence on them. However, despite this, there had been rapid decline in the areas, productivity and upkeep of CPRs. In Section IV, decline of CPRs is explained in terms of new sources of stress emerging from the general dynamics of rural change: demographic pressure, side effects of public interventions/market forces, technological changes, etc. These factors seem to influence the community's approach to their natural resources more than the bio-physical stresses that necessitated stronger CPR support for the village economies.

The conclusion of the paper is that unless the bio-physical constraints in the dry areas are substantially reduced, the deliberate marginalisation of CPRs would mean reduced range of locally managed and used options for the people to withstand the environmental stresses. This is more so for the rural poor who continue to significantly depend on CPRs for their sustenance.

II Circumstances Favouring CPRs in Dry Regions

CPRs could be simply described as community's natural resources where every member has access and usage facility with specified obligation, without anybody having exclusive property right over them. In the Indian villages CPRs generally include community pastures, community forests, wastelands, common dumping and threshing grounds, watershed drainage and village ponds, rivers and rivulets as well as their

banks and beds. Even when the formal legal ownership of some of these resources rests with certain agencies (e.g. wastelands or uncultivated lands, belong to the state's revenues department) in *de facto* sense they belong to the village communities. Most of these community resources, despite their other specific uses serve as important sources of biomass (fodder, fuel, food, fencing, timber, etc.) for the rural communities [Jodha 1990a, b]. Equally important are the temporal and spatial patterns of supplies of their product that further enhance the utility of CPRs in dry regions. To understand these and related aspects, we may comment on the agro-climatic features of dry tropical areas that impart special significance to the provision of CPRs in these habitats. Table I, sketches the key factors involved in the process.

The production environment of the dry land areas in India could be broadly described in terms of low and variable rainfall, frequent droughts, heterogeneous (including erodible and low fertility) land resources, nature's low regenerative capacities and limited and high risk production options. These factors or constraints have several implications at regional level, village-community level and farm household level. In the historical context, persistence of such harsh and risky environmental conditions gave rise to the circumstances favourable to the provision of CPRs.

For instance at the regional level (ie macro-units of dryland tracts) the aforementioned low and unstable production possibilities, restricted population growth, encouraged market wise isolation of villages, and did not attract enough technological and institutional interventions. All these circumstances offered limited incentives and compulsions for privatisation of vast land areas. This helped in retaining fragile lands as CPRs.

At the village-community level, the heterogeneity and fragility of land resources along with the variable rainfall made it difficult to fully harness the potential of resources and adequately meet the environmental risks through private resource based crop farming alone. Balancing of intensive (by cropping) and extensive (by pasture/forest) uses of land as required by the resource characteristics, became a part of collective strategies for risk management and production enhancement. The provision of CPRs, enforced through the social sanctions for protection and usage regulation, facilitated the aforesaid strategies.

At the farm household level, despite several folk-agronomic practices such as crop and livestock based mixed farming, diversified cropping, and other elements of land

extensive farming systems the narrow (farm) production base of private farming could not ensure protection against risks due to temporal and spatial variability of rainfall. Hence dependence on collective risk sharing and complementarity of PPR (private property resource) and CPR based activities became necessary. This again favoured the provision of CPRs.

The features of agro climatic environment and adaptive measures described above can be observed in smaller or larger measure in most parts of dry region. But the whole picture often gets blurred when situation for micro-units (even district level) is aggregated [Jodha 1990a]. In the process the micro level (e.g. village level) environmental situation which ultimately influence the status of CPRs remains unobserved [Jodha 1990a, Chambers 1990]. Hence in order to illustrate the situation summarised by Table 1, two subsets of villages out of the 82 villages covered by the study [Jodha 1986] are made. The group one consists of 28 villages having higher degree of environmental stress and group two includes 24 villages with lower degree of bio physical stress which influence the extent of CPRs and complementarities between the CPR/PPR based activities.

It may be noted that some variables indicating environmental stress such as rainfall and its variability may not reflect true picture at particular village level as these data often relate to rainfall at far away locations e.g. district or block headquarters and the spatial variability of rainfall in dry tropics (even within a short distance of a few kilometres) is incredibly high [Virmani et al 1982]. Hence while selecting the villages with high or low environmental stresses higher weight has been given to the indicators of the situation that is visible/observed or recorded at the village level. They include frequency of drought and crop failures, length of crop growing season, extent of sub marginal land, extent of land without irrigation facility etc.

Summarised quantitative details (Table 2), from the villages with higher and lower degree of environmental stress may further corroborate the above inferences on CPR — promoting circumstances. According to Table 2 the villages with lower but highly variable rainfall, higher frequency of drought, shorter crop growing season, and larger extent of sub marginal lands, limited irrigation facility — all of them representing different sources of environmental stress — have greater extent of CPRs. Prior to land reforms of 1950s (which substantially reduced their area), CPRs accounted for 39-58 per cent of total area in the villages with higher degree of environmental stress. The corresponding figures for environmentally stable (low stress) villages was 15 to 23 per cent. CPRs as

TABLE 1. CIRCUMSTANCES HISTORICALLY ASSOCIATED WITH COMMON PROPERTY RESOURCES IN DRY REGIONS^a

Natural Resource Base and Agro Ecological Features (Low and variable precipitation, heterogeneous including submarginal fragile land resources unsuited to intensive use, nature's low regeneration capacities, limited and high risk production options etc.)		
Implications and Imperatives at		
Regional Level	Community Level	Farm/Household Level
♦ a Low population pressure, market isolation, limited technological and institutional intervention	♦ a Heterogeneity, fragility of resource base, inadequacy of private risk strategies	♦ a Narrow, unstable production base, diversified, farm/ household centred, land extensive farming systems
♦ b Limited incentives and compulsions for privatisation of CPRs	♦ b Balancing extensive/ intensive land uses, focus on collective risk sharing	♦ b Reliance on collective measures against seasonality and risk sharing
♦ c Overall circumstances (a, b) favourable to CPRs	♦ c Community response to (a, b) CPRs (protection, access, usage etc.)	♦ Induced by (a, b) stronger focus on complementarity of CPR/PPR based activities

(a) Table adapted from Jodha 1990b. (b) PPR = private property resources.

TABLE 2. EXTENT OF CPR AND OTHER COLLECTIVE RISK SHARING STRATEGIES IN VILLAGES WITH HIGH AND LOW LEVELS OF ENVIRONMENTAL STRESS^a

Details of Stresses and Strategies	Situation (Range of Values of the Variables) in the Villages with	
	High Environmental Stress (Villages 28)	Low Environmental Stress (Villages 22)

- (a) *Source*: Data collected for the study of CPRs, Jodha (1986). It covered 82 villages from 6 states in dry tropical regions of India. The distribution of sub sets of villages i.e. those with higher and lower degree of bio physical stresses respectively is as follows: Andhra Pradesh (3/4), Gujarat (4/5), Karnataka (4/3), Madhya Pradesh (4/2), Maharashtra (4/3), Rajasthan (6/2), Tamil Nadu (3/3).
 (b) Coefficient of variation of rainfall based on rainfall records at district/taluka headquarters.
 (c) Sub-marginal lands include areas with sandy and unfertile soils, high extent of salinity, rocky and undulating topography, area suffering with water logging, perennial weeds, shrubs etc. not suitable for cultivation.
 (d) Collective sharing activities include collective upkeep and protection of CPRs, common use of private lands during non crop season, seed sharing, desilting of village ponds, maintenance of catchments of percolation tanks, joint field operation during crop season, fodder stocking for charity, maintenance of village bulls, contributory fund for common facilities (including joint litigation for village interests) etc.

mentioned earlier represented part of the collective risk sharing and resource management systems, whose overall extent was much higher in the villages with greater bio-physical stresses

Not only CPR area and CPR contribution to production systems, differ significantly between the villages with higher and lower degree of bio-physical stresses, the extent of other adaptation measures, especially those focusing on importance of bio-mass stability and its uses, also varied in the two groups of villages. This is reflected by higher values of relevant variables in the drier villages. For examples the extent of CPRs also strengthened the natural biomass-centred strategies in the drier villages, whose extent, reflected by values of different variables (such crops with higher stalk grain ratio, dominance of livestock in mixed farming, CPR products as major inputs in private farming, etc.), was higher in these villages than less dry villages. Table 2 provides more comparative details on the two sets of villages identified out of over 80 villages studied [Jodha 1986]

III Decline of CPRs Despite their Rationale and Utility

Information under Table 1 and 2 indicated that CPRs played important role in people's biomass centred and diversified production systems and represented an important component of collective resource management and risk sharing strategies in the dry tropical regions of India. This may be complemented by some quantified information on contributions of CPRs.

Despite the monitoring and measurement complexities, the contributions of CPRs were quantified particularly in terms of fuel and fodder supplies as well as employment and income generation for rural households. Details for over 80 villages reported elsewhere [Jodha 1986] indicated that rural people, especially the rural poor with very limited private resources, depend on CPRs for meeting bulk of their bio mass needs. Over 80 to 100 per cent of the poor households depend on CPRs for these supplies. According to the information summarised under Table 3, despite degradation and reduced productivity, CPRs in different areas contribute to the poor households as follows: fuel supplies 66 to 84 per cent, animal grazing 69 to 84 per cent, employment days 128 to 196 days per household per year, annual income Rs 534 to 774 per household. This constitutes more than a fifth of total household income in most cases. The dependence of rich households on CPRs (for products, income, employment) is very little. However, their focus

is on acquiring CPR land as private land. Inclusion of CPR income in household incomes, reduces the extent of rural income inequalities as indicated by Gini coefficient of income distribution (Table 3). However, despite environmental imperatives supporting the need for CPRs and quantifiable evidence on their contributions to rural economy (especially the economy of the rural poor), since early 1950s CPRs are on the decline in every part of dry tropical regions of India.

Table 4, reproduced from an earlier paper [Jodha 1990a], covering all the 82 villages from seven states in the dry regions indicates that CPR area has declined by 31 to 55 per cent in the study villages of different states during the early 1950s to the early 1980s. Other studies in the dry regions identified the accentuation of this decline [Iyenger 1988, Blaikie et al 1985, Brara 1987, Chopra et al 1990, Chen 1988, Arnold and Stewart 1989].

Reduced area of CPRs causing over crowding and overexploitation of their

	Others			31	164	2		

a. This and all other tables in the paper are based on village/household data from study villages reported by Jodha (1986).

b. Number of sample household from each village varied from 20 to 36 in different districts. Poor are defined to include agricultural labourers and small farm (<2 ha dryland equivalent) household. Others include large farm households only.

c. Fuel gathered from CPRs as proportion of total fuel used during three seasons covering the whole year.

d. Animal unit grazing days on CPRs as proportion of total animal unit grazing days.

e. Total employment through CPR product collection.

f. Income mainly through CPR product collection. The estimation procedure underestimated the actual income derived from CPRs [see Jodha 1986a].

g. CPR income as per cent of income from all other sources.

h. Higher value of Gini coefficient indicates higher degree of income inequalities. Calculations are based on income data for 1983-84 from a panel household covered under ICRISAT's village level study [ICRISAT 1984]. The panel of 40 households from each village included 10 households from each of the categories: namely large, medium and small farm households and labour households.

TABLE 4. EXTENT AND DECLINE OF AREA OF CPR LAND IN DRY REGIONS^a

State (and No of Districts)	No of Study Villages	Area of CPRs 1982-84 (ha)	CPRs as Proportion of Total Village Area		Decline in the Area of CPRs since 1950-52 (Per Cent)	Persons Per 10 ha of CPR Area	
			1982-84 (Per Cent)	1950-52 (Per Cent)		1951 (No)	1983 (No)

b. CPRs include community pasture, village forest, waste land, watershed drainage, river and rivulet bank and other common lands. Data indicate average area per village.

potential, has led to physical degradation and reduced productivity of CPRs. The overexploitation and poor upkeep of CPRs accentuating their physical degradation is also due to slackening or discontinuation of traditional CPR management practices. As reported elsewhere [Jodha 1990a, 1992], more than 90 per cent of the villages currently do not enforce usage regulation nor collect any levy or taxes for investment in CPRs as they had in the past. More than 80 per cent the villages no longer enforce any user obligations today. This is a consequence of the state interventions marginalising the role of community leadership and decline of collective concern at the village level.

Table 5 presents the net results of the above in terms of details on various aspects of physical depletion of CPRs. Findings by other researchers [Iyenger 1988, Brara 1987, Chen 1988, Ananthram and Kalla 1988] also corroborate this evidence. Reduced number of products from the CPRs from 27 to 46 in the past to 8 to 22 at present) and decline in the quality and quantity of existing products clearly manifest the bio-physical decline of CPRs and their reduced capacity to sustain the biomass-centred economy of the villages in dry regions. This also represents the reduced bio-diversity maintained through the CPRs in the past.

IV

Decline of CPRs: New Sources of Stress

The fact of rapid decline of CPRs in dry areas is well recognised. The factors contributing to the decline are also documented at macro and micro levels [Jodha 1990a, 1992, Chopra et al 1990]. The purpose of this section is to identify the process by which the role (rather than the presence) of bio-physical factor supporting CPRs is marginalised. In other words, we look at the new sources of stresses disfavoured CPRs and their primacy over the CPR-supporting environmental stresses. For doing so, we first sketch the process in Table 6 and then present some quantitative evidence to support it in Table 7. Furthermore, we present the quantitative evidence with reference to the subset of 28 villages (Table 2) where the higher degree of bio-physical stresses necessitates the strong provision of CPRs.

Broadly speaking, the key factor diversely affecting the status of CPRs is the overall pattern of rural transformation, which has either reduced the importance of CPRs in the rural economy or made it difficult to maintain them as dependable community assets. The process is manifested by several factors such as increased extent of

technological and institutional interventions by the state, physical and market integration of dry areas, increased population pressure and significant changes in people's attitude towards common resource, and visible changes in farming systems and resource use practices induced by new technological and market circumstance as well as the state support. These factors as elaborated below, have individually or jointly generated incentives or compulsions to discard CPRs at regional, community and farm household levels. In the process, circumstances that historically favoured provision of CPRs at all the three levels (Table 1) have been replaced by the ones that disfavour CPRs (Table 6). These changes are felt and observed in most villages in the dry regions. Some of them have been reported in quantitative terms as they relate to the study villages (Table 7).

Firstly, according to Table 6 at the regional level, due to rapid population growth and the state's undeclared policy of converting CPRs into private lands, and technological and market related factors, there are more opportunities and stronger incentives (or compulsions) to convert CPRs into private

lands. At the overall regional level, on the basis of evidence from over 80 villages, role of these factors have been discussed elsewhere [Jodha 1985a, 1985b, 1990a, 1990b, 1992]. In the subgrouped villages where higher degree of bio-physical stresses suggest the need for extensive CPRs, the role factors diversely affecting CPRs is illustrated with the help of Table 7.

Accordingly, a comparison of situation during early 1950s and early 1980s shows that population density in most villages has almost doubled; distance to market centres has reduced substantially; technological change in terms of irrigation facility and tractorisation has increased significantly; the land prices have increased by three-folds, feasibility and opportunity for privatisation of CPRs, which have non-existent in the past, have become real and attractive possibilities (as shown by the extent and events of privatisation). All these components of rural transformation have created new incentive or compulsions to reduce CPR area.

At the village-community level, the above developments are complemented by the

TABLE 5 SOME INDICATORS OF PHYSICAL DEGRADATION OF CPRs IN DRY REGIONS OF INDIA^a

Indicators of Changed Status and Context for Comparison	States (with No of Villages)						
	Andhra Pradesh (3)	Gujarat (4)	Karnataka (2)	Madhya Pradesh (3)	Maharashtra (3)	Rajasthan (4)	Tamil Nadu (2)
No of CPR - products collected by villagers ^b							
In the past	32	35	40	46	30	27	29
At present	9	11	19	22	10	13	8
No of trees and shrubs per hectare in							
Protected CPRs	476	684	662	882	454	517	398
Unprotected CPRs	195	103	205	215	77	96	83
No of watering points (ponds) in grazing CPRs.							
In the past	17	29	20	16	9	48	14
At present	4	13	4	3	4	11	3
No of CPR plots where rich vegetation (indicated by their nomenclature) is no longer available	-	12	3	6	4	15	-
CPR area used for cattle grazing in the past, currently grazed mainly by sheep/goat (ha) ^d	48	112	95	-	52	175	64

a Based on observation and physical verification of current status (during 1982-84) and the past details collected from oral and recorded description of CPRs in different villages. The choice of CPRs where plot based data are reported was guided by availability of past information about them.

b Includes different types of fruits, flowers, leaves, roots, timber, fuel, fodder, etc., in the villages. 'Past' indicates the period preceding the 1950s. 'Present' indicates the early 1980s.

c Protected CPRs were the areas (called 'oran', etc) where for religious reasons live trees and shrubs are not cut. The situation of CPR plots (numbering between 2 and 4 in different areas) was compared with other bordering plots of CPRs which were not protected by any religious or other sanctions.

d Relates to area covered by specific plots, traditionally used for grazing high productivity animals (e.g. cattle in milk, working bullocks or horses of feudal landlords). Due to their depletion, such animals are no more grazed there.

decline of group action or collective strategies for resource management and risk sharing. This happened both due to increased differentiation of the rural community as well as marginalisation of traditional forms of rural co-operation. Usurpation of community's mandate and initiatives by the state through a variety of legal, administrative and fiscal measures [Jodha 1990b] and the invisible role of market forces in changing the attitudes of people towards collective measures [Jodha 1985b, 1990a] have significantly contributed to these changes. According to Table 7 the number of collective measures or group action activities (including management of CPRs) has declined from 9-13 during (or prior to) 1950-52 to 4-5 during the early 1980s. The state that hardly acted at community level prior to the 1950s now performs 6-8 activities (which were performed by the community itself in the past). This is a consequence of increased interventions by the state under welfare and development programmes [Jodha 1990b].

A related consequence of the above is the increased importance of individually operated as against the 'collectively operated' measures in farming systems. At the farm household level due to their reduced productivity and output CPRs have become less dependable components of farmers' biomass centred, diversified production strategies. Furthermore, again due to facilities of public relief, development aid, new technologies and associated subsidies etc. the individual risk management measures have replaced the collective ones including the CPR-PPR complementarities [Jodha 1990c].

The above description of the situation is corroborated by the quantified evidence presented in Table 7. Accordingly, if proportion of involved household is any indicator, the dependence on CPRs during droughts and scarcity has reduced down to around a one fourth of the past extent of dependence. The corresponding dependence on public relief and grants has increased by many folds. Similarly, in place of 76-84 per cent of the households in the early 1950s, only 18-22 per cent had used CPR products as farm inputs in 1982-84.

However, it may be noted that within the rural communities, the rural poor still depends significantly on CPRs. But like the rural rich, they too are active in acquiring them as private property. As a combined consequence of factors at regional, community and household levels, the proportion of CPR area in village lands has declined from 39 to 58 per cent in 1950-52 to 16-28 per cent in 1980-82 in different villages. Furthermore, more than 90 per cent of the privatised CPR lands, despite their fragility and unsuitability for cropping, are put under crops with very low crop yields [Jodha

TABLE 6. CIRCUMSTANCES ADVERSELY AFFECTING THE EXTENT AND STATUS OF CPRs IN DRY REGION

Recent Economic Institutional Technological Changes Influencing the Patterns of Resource Use (Increased physical and market integration, increased extent and changed nature of public interventions, increased demographic pressure etc. shaping the pace and pattern of rural development)		
Implications and imperatives at		
Regional Level	Community Level	Farm Household Level
a. Population growth accentuating land hunger	a. Development led differentiation of rural community and decline of collective strategies for resource management, risk sharing etc.	a. Reduced area and productivity of CPRs marginalising their contribution to diversified and bio-mass centred production strategies.
b. Public policies enhancing legal/illegal opportunities for CPR privatisation	b. Disruption of community's mandates/initiatives by the state through legal, administrative and fiscal means.	b. Individualisation of adjustment measures against risk, seasonality etc.
c. Technologies and market forces activating the land market extending to fragile lands.	c. Emphasis on acquiring CPRs as private property rather than use collectively.	c. Reliance on private sources, public relief, non biomass oriented technologies etc.
d. Overall circumstances (a-b-c) unfavourable to CPRs.	d. Due to (a-b-c) rapid erosion of community concerns and group action for CPRs.	d. Due to (a-b-c) reduced reliance on complementarity of CPR-PPR activities/products.

TABLE 7. QUANTIFIED DETAILS ON SOME CHANGES ADVERSELY AFFECTING EXTENT AND STATUS OF CPRs IN STUDY VILLAGES OF DRY REGION¹

Details of Change	Range of Values of Change during	
	1950-52	1982-84
Population density (no/Km ²)	37-49	69-98
Distance from nearest market centre (km)	18-26	7-21
Cropped area cultivated by tractor (per cent)	0-1	18-69
Cropped area irrigated (per cent)	0-6	3-18
Cost of dry lands at 1980 prices (Rs/ha)	450-700	1500-2500
Extent of CPR area privatised (per cent)	0-0	30-63
Incidents of CPR privatisation

(a) Villagers' group action (no)	9-13	3-5
(b) Government agencies (no)	0-3	6-8
During drought/scarcity households mainly depending on		
(a) Public relief (no)	5-9	73-82
(b) CPR products, collective supplies group action (no)	63-80	15-17
Households using (>4) CPR products as farm input (no)	76-84	18-22
Proportion of CPR area in total land of the village (per cent)	39-58	16-28

Notes: a. The data relate to 28 villages with high degree of bio-physical stresses (Table 2).

b. Based on limited number of land transaction in different villages.

c. Data indicate the cumulative situation since the land reforms during 1950-52 rather than during 1982-84 only.

d. For type of community level activities see note (d) under Table 2.

e. Information relates to early 1960s and late 1970s for over 15 villages of Rajasthan, Gujarat and Maharashtra for which studies on impacts and adjustments to drought were conducted [Jodha 1990c].

FIGURE 1: DISTRICTS AND NUMBER OF VILLAGES COVERED BY THE STUDY ON COMMON PROPERTY RESOURCES IN DRY REGIONS OF INDIA

1990b]. Thus the state's undeclared assault on CPR, specific opportunities created by market forces, land hunger accentuated by population growth, collapse of traditional forms of rural co-operation, and reorientation of farming systems de-emphasising the role of bio-mass, are the key factors that have led to marginalisation of CPRs' role and decline of their area and productivity in the dry areas.

Viewed in a broader and long-term context of sustainable use of dry lands, the changing situation of CPRs represents a well known conflict between ecological and environmental imperatives of resource characteristics and the features of development interventions. At the moment both policy-makers and village communities seem to give higher priority to the latter. Consequently, CPRs are deliberately ignored as a part of development strategies [Jodha 1992]. The present patterns of rural transformation do not support them. However, the ecological imperatives

(supporting CPRs) and sustenance of rural poor are quite important factors, which may not be ignored unless substitute options to CPRs that meet these two concerns are evolved.

Equality versus Incentives

Ashima Goyal

Market Socialism: The Current Debate edited by Pranab K Bardhan and John E Roemer; Oxford University Press, 1993; pp 324, Rs 495.

THE reviewer has a difficult time with today's innumerable conference volumes composed "so much, so much of odds and ends". Even so, this particular volume is well structured and has papers of a uniformly high calibre. It is possible to tell a coherent story by taking up the central theme and drawing upon relevant arguments from the papers in the volume. Most of the chapters follow a discursive rather than mathematical mode. Even so, they provide a pleasurable conceptual thicket to wander in.

The theme is debating the compatibility of markets and socialism. The debate was initiated a long time ago with Lange's recognition of the information content of prices, and attempt to reconcile public ownership and planning with the use of prices for the allocation of resources. Dispersed private information could then be made use of. Public ownership would remove a major source and perpetuator of inequality. Planning could prevent the inadequacies of private investment, arising from externalities and imperfect capital markets. It seemed an ideal solution. As with all man-made utopias, however, time, further thought and some experimentation brought out the flaws in the scheme. These were the unresolved microincentival issues. The disincentives for innovation proved to be especially serious. In its modern avatar the theme becomes how to have equality of wealth and status and yet get from each according to his ability.

Two developments make the time ripe for returning to this topic. Firstly, the large amount of work over the last two decades on principal-agent problems. This can shed light on the nature of incentives in socialist structures. Second, the collapse of socialist regimes and the need to design new institutions for them. The papers are motivated mainly by the first question. Neither the type of market socialism, nor the concept of equality it involves is uniform across the authors.

Kornai's seminal idea of the soft budget constraint was the nail in the coffin of market socialism as it was practised in East Europe. Here he argues that market socialism is doomed as it has neither the discipline of the market nor the autocracy of communism. Stiglitz agrees. The reason: market socialism is based on a Walrasian system, that neglects (1) the role of contracts, decision-making

and reputation in a world of imperfect information, and (2) cyclical unemployment. Makowski and Ostroy make the same point in a paper that conveys the excitement of a theoretical *gestalt*. In the Walrasian system the information content of prices was recognised. The new dimension was the idea of incentive compatibility of an equilibrium. If each agent is paid his marginal product, he will have no incentive to under perform and will fully reveal his private information. Only with perfect competition, where elasticities of substitution are infinite, will prices equal marginal and social product. The price system becomes the means for rewarding each agent with his full social contribution. In other cases lump sum transfers would be required.

How to avoid the agency problems associated with public ownership and the inequality with private ownership of capital? Roemer presents the idea of profits being distributed evenly by allotting ownership coupons on firms to individuals. They would be allowed to trade the coupons, but not to liquidate their portfolios. Stock markets could then perform a signalling function. But concentration of wealth through the poor selling to the rich would not take place. He shows that in such an economy social welfare is likely to be higher.

Stock markets are not well developed in many poor countries. In Bardhan's proposal, workers and other firms hold shares of large firms. The Japanese type Keiretsu or cross holding relationship between banks and large corporations could also be used to discipline firms and harden their budget constraint. In the large open corporation, where ownership is separated from control, disciplining is achieved through corporate takeovers, at a very high cost. Bardhan argues that the cost of his alternative would be lower. International competition in the product market is also a necessary disciplining device. Private ownership could be allowed in small firms on the innovation frontier. Dispersion in wages and salaries is permissible. Fleurbacy supports a similar system. Weisskopf points out that there are many ways of unbundling ownership and control, but agrees with Roemer that his suggested structure constitutes a small change which would be easier to implement and more likely to succeed than total social re-engineering.

Roemer and Silvestre show that in a Walrasian-Lange model, the government can realise a desired vector of investments by suitable price and quantity interventions, even without public ownership. Putterman plumps for this alternative, as it avoids the inefficiencies that arise in the coupon economy from the fact that individuals are not free to dispose of their portfolios.

Some specific incentive issues addressed in this volume can be classified under the following heads:

(1) **Innovations:** Socialist economies have fared badly in this respect. Berliner takes a pessimistic view, pointing to the obvious problems, monopolistic R and D establishment, absence of parallel research, bureaucratic interference and centralised price mark-up that discriminates against new products. As the latter normally lose money at first they need more flexibility in price setting. He argues that while some of these disincentives could be removed in the new regimes, it would be difficult to give managers sufficient incentives for innovating as long as restrictions remain on private wealth. Quian and Xu take a more hopeful view. First they point out that bureaucratic economies with a soft budget constraint spend more time in pre-monitoring. Therefore they tend to undertake more large projects with mature technologies (space, nuclear) and greater probability of success. Small projects with high probability of failure create the technological cutting edge. Decentralised market socialism with means of production, including finance, owned by multi-level communities may be a solution.

(2) **Finance:** Dewatripont and Maskin have a model that brings out potential adverse effects on project selection arising from the structure of financing. If financing is done by small banks that need to refinance in a second period, good but slow projects would not get financed, but neither would poor projects. Big banks and financial institutions would not exclude the former, but could finance some poor projects also.

(3) **Managers:** Roland and Sikkat point out that managers under socialism have an incentive not to reveal their true skills, since the government as a monopolist employer can always reduce payment after such revelation. Market socialism could worsen the problem as possibilities of promotion in a bureaucracy also go. Giving a reward for high target, a lower reward for over and a penalty for under fulfilment could induce managers to reveal their true type.

(4) **Workers:** Other ways of inducing greater equality in a society include worker

owned and managed firms, and social democracies with equalising tax-transfer mechanisms. Cohen and Rogers argue for associative democracy. Organisations such as encompassing unions could raise co-operation and equality. Moene and Wallerstein point out the reasons why just such a consensus with centralised trade unions has broken down in the social democracies of Norway and Sweden. Dreze makes some suggestions for overcoming incentive problems in worker-managed firms. Workers are risk averse and find it difficult to fund high capital intensities and to employ outsiders. The traditional theory of the labour managed firm needs to be expanded to take account of funding and employment risk in a world of uncertainty with incomplete insurance markets. A potential solution he outlines is: workers are paid a fixed wage and a fixed share of profits is used to make a contribution for their social security. Worker managed firms tend to make wage reductions more easily but they compensate for adverse shocks by working longer hours rather than expanding employment. The best way to attain the latter is still expansion of the number of firms.

Equality as a value judgment has deep roots in the human psyche. Long ago Aristotle equated it to justice. Arneson argues that equality can conflict with the liberal viewpoint. Miller would like to focus on equality of opportunity of status and of access to social goods.

Being a hybrid market socialism is criticised both from left and right. It ignores class power exploitation realisation crises. Patnaik (1995) says that Lange's model is a computer analogue of a market, not a social institution. A Walrasian equilibrium can never exist since it does not have a disciplining device such as a reserve army of labour. Arnold (1994) has argued that if exploitation is defined as a failure of reciprocity and a wider range of economic relationships are taken into account then there is more exploitation in socialist systems. The reason being that people are not paid the value of their contributions to society. This he argues is fundamentally unfair apart from its effects on efficiency.

Market socialists seem to be giving up every cannon they once held dear except for a truncated equality. Bardhan and Roemer point out that market economies have also accepted socialist ideas such as government intervention, social welfare and support for investment. If these issues are to form the nucleus of a possible consensus it is strange that they are sadly neglected in this book. It is part of the general neglect of macro-economics even though the economics of imperfect information and missing markets leads naturally to macro-economic concepts

of underutilisation of resources and under-investment. Stiglitz and Dreze touch upon it. Roemer and Silvestre have an interesting exposition of a tax subsidy scheme that can reach a socially desired level of investment that exceeds the Walrasian one.

The agency problems of public ownership can contribute to the privatisation debate in India. It should be easy to realise Bardhan's scheme by converting public sector debt held by banks into equity in public sector undertakings. This might help the government to retire old low coupon rate debt and create a vibrant money market. To be really fruitful here the debate must be linked to the problem of funding a rise in public investment. Vital social dimensions are ignored in this book. The unrelieved opportunism taken as the sole motivator of agents is too stark. Man does not give of

his best only for money. In India privatisation by raising revenues for an expansion of public investment in social infrastructure would doubtless raise efficiency. It may also signal a transformation from a government that repressed private initiative to one that supports it. This in turn could change social habits.

In sum the book is well worth reading. It is the story of the interplay between ideas and reality that has created history and is still changing the face of nations.

Through the Prism of 'Hegemony'

Achin Vanaik

Struggle for Hegemony in India (Vol. 1: 1920-34, Vol. 2: 1934-41 and Vol. 3: 1941-47) by Shashi Joshi and Bhagwan Josh, Sage Publications, New Delhi, February 1992, September 1992 and January 1994. Vols. 1 and 2 Rs. 325 each, Vol. 3 Rs. 375.

BHAGWAN JOSH's and Shashi Joshi's three volumes are a reconstruction and reinterpretation of the Indian independence struggle that is largely refracted through the central concept of 'hegemony'. Their understanding and use of this term is loosely derived from Gramsci, loosely because they use it in ways that do not always have fidelity to its original Gramscian usages. But that in itself is a minor question. The more important issue is whether they use it in ways that are fruitful and enlightening.

Though covering three volumes their narrative is not a comprehensive or even a summary survey of the political life or of the complex relationships between the varied array of political forces in the period under question. The structure of the narrative offered is distinct and takes it in a very different direction. There is, above all, a detailed and insistent critique of the communist left in the National Movement period and as a counterpoint to it a defence of Gandhi and the Gandhian strategy for securing independence via the Congress.

It has been widely accepted among left and mainstream scholars that one of the central dilemmas for the communists in the National Movement period was their failure to adequately grasp the character, complexity and changing shifts of balance within the Congress Party-movement and thereby properly orient themselves towards it as part of their anti-imperialist struggle for independence. What is distinct in the

treatment here is the diagnosis and description given for this communist failure. Josh and Joshi in effect argue that the colonial British state was semi-hegemonic (there was repressive rule but it was both disguised and mitigated by the existence of legitimising and representative institutions, values, etc. which also helped to organise dissent against the state in manageable/controllable reformist ways) and that therefore the only strategy that could possibly succeed was a counter-hegemonic one of the kind that Gandhi actually organised and led. His strategy avoided the Scylla of containable reformism and the Charybdis of revolutionary insurrectionism, pursuing instead a revolutionary reformism aiming at a steady systematic transformation of the colonial state through an escalating series of compromises (and periods of exercising power at local and provincial levels) in which the major weapon of pressure was the Gandhian organisation of a non-violent mass movement. The influence of other currents in Indian historiography on Josh and Joshi is here quite evident.

The communists specifically and the left generally should have realised that the only historic role they could have sensibly played was not to advocate or pursue a 'politics of alternative' to the Congress or to try and build a separate party but to reconcile themselves to contending for a stronger left hegemony (ideological influence) within

the Congress in which Gandhism should have been seen as embodying a left-of-centre force. Only Nehru on the left understood this properly: hence his largely unwavering allegiance to Gandhi which should not be misconstrued as a psychological dependence but as a partly theorised and partly intuitive grasp of the role of Gandhi and of the importance of the Gandhian political strategy.

Much of the narrative therefore focuses on the foolishness of the communists in behaving like typical communists. Over and above the problem of being too easily influenced by the Comintern and outside communist parties, was the general communist Marxist failure worldwide to understand the nature of nationalism. Josh and Joshi's theorisation (and they do spend a lot of space theorising on this) of nationalism and of Congress populism is clearly decisively influenced by what would once have been called Eurocommunist readings of Gramsci's legacy and what would now be called post-Marxist readings of such notions as the historic bloc, the national popular, and ideological interpellations. There are in short very marked similarities to the kind of understandings of Gramsci and (Latin American) populism that thinkers like Ernesto Laclau have assiduously promoted elsewhere. At a general theoretical level, therefore, the kind of criticisms that have been launched against the paradigm (now well-trodden ground) would also be pertinent here.

How plausible is the history given to us by Josh and Joshi considering these theoretical problems? Practising historians with authoritative expertise over the period under survey can give a much better evaluation. But this reviewer was certainly struck by certain features of the volumes in question. There is no serious attempt whatsoever to situate the issue of Indian decolonisation internationally. Two aspects in this regard are particularly important: the objective impact of the very existence of the Soviet Union and the consequences of second world war on Britain and its determination and capability to sustain the empire. The point is: without a careful weighing of factors both extrinsic as well as intrinsic to India and to the Congress, can one really derive an adequately balanced understanding of the process of Indian decolonisation or of the contribution of communism domestic and international to it or indeed of the efficacy of the Congress strategy itself? Though the third volume is supposed to take the narrative up to 1947, there is nothing about second world war's impact on Britain, the dawn of American pre-eminence, the consolidation of Soviet power after 1945, and the effect of this new

international relationship of forces on issues such as decolonisation.

Furthermore, what about the relationship of Gandhism and the 'successful' Congress strategy to the tragedy of partition? The structure of the third volume is peculiar but also revealing. Ostensibly supposed to update the story of Indian independence from 1941 to 1947, seven-eighths of the volume does not deal with this period at all but only up to 1941 with a great deal of space given to medieval India. The supposed reason for this is that this is the volume that has to deal with the question of cultural power, cultural contestation, cultural space, cultural enclosure. Hegemony after all is culturally mediated power, an understanding that risks making it an amorphous transhistorical concept of little value unless handled skilfully. Josh and Joshi go so far as to suggest that any kind of durable political rule must necessarily exercise some kind of cultural hegemony and have little hesitation in claiming this for Mughal rule, where Islam either of a revisionist (Akbar) or dogmatic (Aurangzeb) kind must then necessarily feature in the construction of such a hegemony. Despite all their talk of cultural contestation and change, their understanding of culture is basically essentialist and therefore deeply flawed. One of their more fundamental postulates is that there has been a cultural faultline, broadly corresponding to Islamic and non-Islamic cultures throughout Indian history since the advent of Islam.

Since the construction of a desired cultural hegemony cannot be without reference to history, and the actual cultural terrain, such an interpretation of India's cultural life provides the basis for an exculpation of Gandhism and Gandhian political strategy from any serious accusation of fostering a

communal divide and hence promoting Partition. The question for Josh and Joshi is not what kind of cultural nationalism is appropriate for an Indian nationalism but what kind of Hindu nationalism is appropriate for Indian nationalism — the Gandhian kind or the Savarkar kind? Here, too, the Gandhian strategy is not to be faulted. It is secularist illusions about the malleability and secularity of culture that were the problem.

By extension, today's struggle for a unifying cultural nationalism that can undergird Indian nationalism has to operate on a terrain different from that which westernised secularists not in tune with the actual history and culture of India would seek to define. Today's left (communists or Marxists) are therefore as much out of tune with the meaningful and desirable possibilities or futures for India as they earlier were in the National Movement period, only this time joined by liberal secularists as well. The left will simply never learn!

So where do we go from here? It is not entirely clear where Josh and Joshi pin their hopes. A politics centred on class (the communists) or on caste (the Lokhit tradition) or on community (the BJP) will not do. Only one centred on nationalism incorporating all three codes, but not allowing any of them to dominate its ideological political discourse can lead the way forward. This would seem to leave only the existing, tattered, decayed yet still the one and only Congress now carrying the ensign of a soft Hindutva, with the responsibility of picking up the mantle. In so many ways, Josh and Joshi have written the kind of book Mohit Sen would have loved to write and a more intellectually vibrant and sophisticated clone of Narasimha Rao would have loved to read.

Politics of Diversity

Religious Communities and Multiple Patriarchies

Kumkum Sangari

This essay reviews the current debate between maintaining religion based personal laws and instituting a uniform civil code in the context of gender inequality and Hindu majoritarianism. It challenges the assumptions on which positions that advocate legal pluralism and defend personal laws have based their case.

The essay argues that prevailing notions of community are bureaucratic, reductive, static and essentialist and defeat their own declared objective of maintaining social pluralism. It critiques the enmeshing of religious community with personal laws as a form of new orientalism that is both patriarchal and ideologically laden, and argues against positions advocating reform of personal laws by state or community.

The author critiques ideologies of cultural diversity that rest on assumptions of discrete homogeneous communities on religion as the singular axis of diversity, on a conflation of religion, culture and patriarchy, and on a confusion of social disparity with diversity, as all being incapable of reckoning with existing cultural diversity.

The concluding section of the essay argues against the perception of religion or religious legal systems as the sole determinant of patriarchies. Patriarchies cut across all primordial principles of social organisation, call into question the very principle of demarcating communities and personal laws that prevails at present and cannot be fought from within by an identitarian politics. Multiple yet overlapping patriarchies should underpin new common laws that take into account existing axes of social differentiation even as they transcend such differences in the realm of rights. New laws must encourage a genuine religious plurality and be based on both the differences and overlaps between existing patriarchies. Inalienable rights for all women must be established while a new type of legal particularism should be instituted responding to the situational specificities of patriarchal arrangements.

[The paper is published in two parts. The second part will appear next week.]

Introduction

SHOULD religion based personal laws be maintained or should a uniform civil code be instituted? The debate stretches back to the colonial period, and was prominent in nationalist and early feminist agendas in the 1940s and 1950s. It is one of the most fraught and urgent issues at present, in part because gender justice has not yet been written into the law, and in part because following on the Shahbano judgment the BJP not only appropriated this demand for a uniform civil code, but also reshaped it as a weapon with which to attack the continuance of Muslim personal law. By now, the question of a uniform civil code is so overdetermined by communalism that it tends to appear mainly as a device in the hands of Hindu majoritarianism, even though the deployment of this device on their part is manifestly more rhetorical than substantive. At present the Hindu right is busy occupying most available positions on the uniform civil code including some hitherto liberal and feminist platforms. However, though they mimic some of the liberal and feminist arguments defending a uniform civil code and rest their case on 'gender justice and secularism', their anti-Muslim bias is pronounced, and a closer examination reveals that their version of

gender justice is no more than a pragmatic design for a modernic Hindutva.¹ Clearly, as an anti-Muslim party whose past and future existence mainly depends on Hindutva, the BJP does not have the right to draft a uniform civil code.

However, the sequence of events that have increasingly communalised the issue has led feminist groups themselves into taking opposing positions. In the present political climate the fact that feminist groups had only a few years ago undertaken campaigns against the rapes of Mathura and Rameezabi without pausing to ascertain their denotations, seems remote if not subsumed by the present emphasis on discrete religious identities, while any insistence on the desirability of political solidarities across religious lines is now liable to be dismissed as an extinct species of naive secular idealism.

The issue has to be addressed with precision because gender justice remains a desired horizon, though the means of its legal institution have become controversial. Further it has to be addressed in ways that do not surrender to the present ideological rationale of the Hindu majoritarian right for a uniform civil code, an aggressive anti-Muslim agenda that takes shelter under the insignia of a unified nation. The Hindutva notion of a unified nation is both

increasingly used and perceived to be a code for Hindu supremacy and Muslim incorporation. However, in my view, the political and theoretical ground for a rejection of the Hindutva version of unified nation, will have to be different from the now fashionable post-modernist diatribes against the nation and unity *per se*. These provide neither a determinate answer to communalism nor a solution for gender inequality.

Among the numerous positions on the issue, those that are explicitly or implicitly based on some degree of genuine concern for gender justice and secularism, range from briefs for legal uniformity to versions of legal pluralism. Legal uniformity is crudely posed as a melting down or pot-pourri of personal laws into a composite uniform civil code that will be a means for social unification, communal harmony and (implicitly or explicitly) national unity. Or it is posed in a more nuanced way as a uniform civil code that can be gradually instituted with the consent of minorities. In this view, gender justice is seen to depend on legal uniformity, and uniform access to secular laws to be a precondition for democracy. On the other hand, those committed to the present form of legal pluralism envisage a reform of personal laws from within (and in a more extreme

form, the institution of self-legislating communities) or a reform of personal laws from above – that is by the state. These reforms are envisaged in three overlapping ways – making all personal laws consonant with gender equality as enshrined in the Constitution; reforming all of them along 'uniform' principles of gender justice, or making different packages of gender justice within each personal law. Most of these rely in different degrees on re-interpretation of religious texts – while some perceive such reforms as a prelude to the uniform civil code. Finally, in an effort to reconcile the existing legal pluralism with a desired unity, some advocate working towards an extended set of gender just common laws that can coexist (either for the time being or indefinitely) with personal laws, here more concrete proposals have been made for common secular laws on joint matrimonial property and domestic violence.

There are a number of assumptions, often less explicit than these articulated positions that are nevertheless vital to their formulation. The case for legal uniformity, for example, rests on uniformity as signifying a consolidated nationhood, social homogenisation and harmony as well as democracy, legal equality and individual rights for women. By contrast, the assumptions on which the case for legal pluralism rests include a presumed antagonism between the religious community and the nation-state, the right of communities to their own laws, the presupposition that personal laws are tied up with religious belief, and a tacit division of public and private. Legal pluralists also assume (or argue) that uniform laws will be an agency of homogenisation, that the preservation of social plurality or cultural diversity depends on maintaining personal laws, that gender justice need not depend on legal uniformity, and that women struggling for justice cannot unite across religious divisions.

The case for legal pluralism is further overdetermined by a confluent current of theoretical tendencies that seek to unsettle all forms of homogenisation associated with nationalism, the nation-state, derivatives of European enlightenment and rationality such as a unified legal subject, to establish diversity or heterogeneity *per se* as a value, and to re-escape the notion of 'community' – mostly religious community – as the privileged social project, especially for countries formerly subject to colonialism and at present to an equally rapacious form of globalisation. This influential transnational academic discourse is appealing for and finds a resonance with several intellectuals, on the one hand those committed to anti-modernity types of indigenism, and on the other with those whose own critique of the Indian state has come from a different kind of political

experience of the growing delegitimation of the Indian state (its authoritarian suppressions in Punjab, Kashmir and Assam, a subsequent cynicism about all state-centred solutions, as well as a corollary and justifiable suspicion about enlarging the areas of the state's jurisdiction over persons), but is now compounded by a loss of confidence in the historic left agendas for the transformation of such states.

As regards legal uniformity, we need to address a number of issues that are usually elided. Is it not the case that the present conception of the uniform civil code itself replicates some of the very assumptions that form the basis of the personal law? Is a conception of uniform laws possible that can truly take into account the existing social stratifications and heterogeneities? Do we at all require an idea of nationhood based on legal assimilation and uniformity? In what ways may it be possible to recuperate its more positive aspects – namely the desire to procure secular, democratic and equal rights for women – without duplicating its problems?

Meanwhile, three types of issues are raised by legal pluralism. One set centres on religion and community, involving a whole host of specific concepts of religion, community, public and private domains, etc. that underpin the defence of personal laws and culminate in posing an intractable opposition between individual rights and primordial community rights. A major question that gets suppressed or elided here is simply this: why if gender justice is commonly desired, should it be sought within the framework of separate personal laws? This elision involves at least two sets of conflation: of law with religion and belief on the one hand, and of women with religion, belief and community on the other. The argument is usually sought to be clinched by questioning the legitimacy of the state as a source of laws for women, that is, by pitting the community against the state, in such a way that though women remain the object of legislation for both, community is nevertheless presumed to be a more reliable or intimate legislative authority.

A second set of questions emerge from prevailing notions of legal pluralism. These notions have a broader significance since they are implicated in the very terms which seek to define cultural diversity in India: they often tend to presume that religion is the singular, or at least the privileged axis of this cultural diversity and that this so-called cultural diversity is synonymous with or dependent on legal pluralism. Feminists need to interrogate these assumptions and discuss the dangers that prevailing ideologies of religious community and cultural diversity present for women as well as the implications these ideologies have for feminist theory as it confronts the nature of the divisions among women. Finally,

another triad of questions arises from legal pluralism: (a) the problematic relation of laws, both uniform and personal, to specific types of social homogenisation and social plurality, (b) the nature of existing patriarchies and whether they are to be opposed through legal pluralism or legal uniformity, and (c) the possible relations of feminist theory and strategy to particular types of homogeneity and plurality.

The opposition that has been set up between personal laws and a uniform civil code is so manichean and politically peremptory that even the earlier ideal/idea behind the uniform civil code – as an enquiry into the possibility of gender equality, democratic rights and full access to equitable laws regardless of denomination – cannot be recuperated without altering the terms of the debate. Such manichean dualities can be undone only if the stake is neither community nor state, but gender justice as a principle and as social horizon – whether this is to be striven for through new sorts of legal homogeneity or through legal pluralism, or, even through legal pluralism accompanied by a hitherto unavailable freedom of choice for women. I propose to discuss the aforementioned issues as a way of clearing the ground in order to shift the terms of the debate.

As these issues indicate, the question of personal law hinges crucially and connectedly on notions of community, religion, state and cultural diversity, and the compatibility of each of these with gender justice. In the first part of the paper, I will take up these in the form of a critique of the extant ideologies of religious community, of personal laws and their reform by either community or the state. In the second part of the paper, I will discuss the ideology of cultural diversity and sketch an alternative notion of cultural diversity through a discussion of religious pluralism and legal pluralism, and then present a preliminary analysis of multiple and overlapping patriarchies in the last section. Religious and legal pluralism alongside multiple yet overlapping patriarchies are in my view (racial co-)ordinates in rethinking the question of gender justice outside the constrictive opposition between personal laws and a uniform civil code: a fresh understanding of these can help to formulate a material basis for new laws.

A substantial part of my essay discusses the concept of religious community for a number of reasons. Firstly, in various ways, this concept underpins the defence of personal laws and plays into some liberal and majoritarian projects for a uniform civil code. In turn, the academic and the political discourses which privilege the idea of community are moulding and even setting the parameters for the present debate on laws. Secondly, community claims are not confined to minorities but a central feature

of pan-Indian Hindu majoritarianism. Thirdly, the prevailing definition of community is so reductive, static and essentialist that a defence of community in the name of social pluralism defeats its own declared objective of maintaining cultural diversity.

I believe that a feminism which is based on a critique of biologism and of the sexual division of labour rests definitionally on the right to chosen political affiliation and privileges social identities (as the terrain of contest, affirmation or remaking) above birth bound ones. It cannot flirt uncritically with primordialism. Primordial claims cannot be a feminist principle because they are a principle of irrevocable division and will divide women by region, caste, religion and race. We can only take principled positions on the basis of non-primordial collectivities.

Thus if it is true that religious community is at present to some extent a political identity (though an exclusionary one) it is equally true that there are political collectivities that do not insist on or trade in either the primacy or the exclusivity of primordial identities. In fact most political parties appeal even now to identities other than the religious, so do numerous organisations and movements involving women, peasants and workers. Women's struggles within left-democratic frameworks rest on a view of women as bearers of a distinct political identity and a community of interests neither primordial nor biologicistic nor exclusive of class or cultural claims. Should we strengthen these political arenas where religious affiliations can be downplayed or should we, as present communitarian, identitarian and communal politics would prefer, force them to remould or discard their agendas in favour of religious communities?

Arguments that uphold the autonomy of personal law and place the onus of reform on internal change within a minority community as I will show rest on a thoroughly and dangerously ideological set of interrelated assumptions: the problems of Muslim women appear to arise from Islam and personal law, religion and patriarchy appear to be absolutely identical. Muslims are decontextualised by being presented as living in their own world, a world sustained by religious differences alone. In fact much more than Muslim personal law goes into making up the oppression and inequality of a patriarchy and all of that is at work for non-Muslim women as well. The communalist intensification of religious differences and the increasing primacy of religion as an analytic category for a section of the non-communal well-intentioned intelligentsia are both tending to veil this common reality as well as to displace egalitarian struggles against patriarchies.

The most reprehensible and communal form that a projected uniform civil code has taken is replete with majoritarian and 'Hindu nationalist' assumptions – this holds up the reformed Hindu personal law as an exemplary model for minorities to imitate. However most secular projections of the uniform civil code are also problematic: they have replicated the personal laws in significant ways or have set out to solve the problems raised by personal laws on the same terms. A uniform civil code envisaged as either a melting down of all personal laws into a common mass or as a composite code drawn from what is best in each religion are far from useful: both as formulas for national unity rest on a homogenisation of patriarchies and replicate the community assumptions of personal laws. Projected uniform civil codes are usually formulated as a *replacement* for personal laws and intended to fill the same space these occupy: a problematic space that rehearses a principle of legal division on the line of public and private domains. Finally projected uniform civil codes have by and large replicated the reductiveness of personal laws in not reckoning with heterogeneity or plurality save as a matter of levelling. As such the new laws can best realise their secular and egalitarian aims and premises only if they are conceptually different from the uniform civil code in the way it has so far been projected.

The struggle for legal rights for women is a product of earlier and common struggles for equality: they are neither a project of community cohesion nor a project of national and social unification. Thus personal laws and most projections of the uniform civil code have been tied not only in a binary but also a symbiotic relation that has stifled even deflected a reappraisal of laws in their entirety.

My own position arrived at through a questioning of certain prevailing notions of heterogeneity and specific forms of homogenisation is in favour neither of personal laws nor of a uniform civil code: it is presently projected rather it rests on different conception of both homogeneity and heterogeneity: that is a notion of common laws that can take into account the multiple existing axes of social differentiation in India even as they transcend such differences in the realm of rights. I envisage a set of universal and inalienable rights for all women accompanied by a legal particularism that is determined neither by religion, community nor for that matter by the present categorisation of family laws but situationally in terms of legal provisions designed to address the specificities of patriarchal arrangements. While we should adopt a strategy which does not isolate minorities it is naive to imagine that any change would occur without conflict with patriarchal interests: such interests are by

no means the monopoly of minorities but are spread across religions. However I am not presenting a finalist solution. Rather I am attempting to establish the analytic parameters for a common directionality as well as a fresh starting point for devising new laws which I will detail at the end of the essay. There has to be a participation of women across castes, classes and denominations in deciding what new common law should look like and the results of that are not a foregone conclusion.

I Religious Community: A Critique

The conception of community that underpins many of the positions committed to the continuation of personal laws is quite tendentious. In this conception community is static, fixed and primordial: religious ties are privileged above all other primordial ties of kinship, language, region, caste or custom, birth bound vertical bonding on primordial religious lines is further privileged above that based on class, contiguity, occupation, and certainly above that based on chosen forms of collectivity. The maintenance of religious communities appears to be the favoured social project primarily for non-European countries that were formerly subject to some form of colonialism. This is accompanied by a complementary conception of religion as inert, self-standing, isolated from social processes and from other religions – a conception that rests on a naive conception of faith and community. My objections to these are both historical and political.

(1) COMMUNITIES, CLASS, FORMATION AND THE FLUIDITY OF RELIGIONS

It is well established that present day community claims are unarguably modern and mutable. I want to stress the *contradictory logics of community formation* especially in northern India: a feature seldom acknowledged by those who believe that politically defined communities are here to stay. Not only does the use of the category community by itself constitute a severe analytic reduction but its own history ensures that it can neither be abstracted from class nor be used to displace class with culture. The specific development of capitalism within colonial political economy paradoxically provided the imperative both for making new communities and for disintegrating earlier communities based on religions, castes and jatis while it also set up a dialectic between class and community as avenues for social mobility and recognition from the colonial state. Community claims were becoming a tried and tested path both to mobility and for bargaining. One feature of even a partial embourgeoisement was cutting free from reciprocal, patterned and ritual

relations with low castes, combined with a belief that community prosperity and organisation could be vectors of class mobility and/or retention of status and class power, in practice too the cross-hatching relation between class and community determined entitlements, property, authority, education and jobs.¹ In the nineteenth century a variety of social processes helped to constitute a double pull and a tense logic of class formation and community claims: census and administrative operations, forms of legal codification, avenues of upward mobility for individuals as well as through caste or denominational clusters: that is a cross-class bonding which undercut individuation.

The combinations of class formation and community claims were especially evident in the redefinition of major religions in nineteenth century northern India. The structural similarities of reform movements that were thrown up by what was a common historical process are themselves an indication of the *confluent* and contradictory imperatives of class and community. Not only was there a visible complementarity in reform movements but the re-formation of major religions in the north was virtually a mirroring process. The assertion of identity by new elites, the removal of syncretic elements that drew on more than one religious system or 'bridged' a variety of religions, the excision of popular forms of worship and the 'purification' of religions, the insistence on discrete marriage and funeral rites, the new obsession with scripturalism/textualism, the attempt to establish and function through voluntary associations, educational institutions and the popular press, the policing of boundaries by religious spokesmen in a tacit but unspoken relation of mutuality and reciprocity with each other, their matching visions of uniformity as a principle of community cohesion – all these bespoke a roughly similar notion of religious community though in each case the religion was different. (The structures of Christianisation, Islamicisation and Sanskritisation were remarkably similar though their respective etiquettes and modalities differed.) At the same time these very similarities revealed that religious re-formations were at once cross-cut, overdetermined and shaped at their deepest levels by class formation: that common class and caste anxieties were underwriting religious assertions. A logic of caste was also at work within this process. In the late nineteenth century in the north it was often upwardly mobile middle castes who not only universalised a selective version of brahminical texts and domestic ideologies, achieving a certain levelling of high upper caste culture by making it less high and more commonly available in print, but who were the most strident in their self-

distanciation from lower castes. Excising lower caste/class elements and making caste-based communities were equally implicated in class mobility. Thus class mobility occupied every stage (being prior to, part of as well as product of) of the formation of communities based on caste or jati and religion.²

This process of the formation of modern urban classes and the re-formation of religions was at one level consonant with British policy. One push to form and redefine groups and communities came from the typologies of British administrative categorisation which produced *discrete*, well formed bureaucratically negotiable units,³ that in fact could only reproduce themselves by repressing all kinds of less easily definable diversity. However, despite the confluence of forces, homogenising attempts succeeded only in segmentary ways.

Hindu, Muslim and Sikh identities in the nineteenth century were plucked out of a far more shifting and multiple field of practices in the north. Normative elements and orthodoxies already existed in the eighteenth century – these now took a new shape and stridency and occupied new social locales.⁴ And yet despite this, denominational categories retained varying degrees of amorphousness, both in social perception and as legal categories. Brahmo Samajis, sikhs, Jains and Buddhists etc. were Hindus for some but not for others. Hinduism, Sikhism and Islam were all in the-making through similar strategies and often with similar aims, preoccupied with the Hinduisation, Sikhisation and Islamicisation of unclassifiable or interstitial groups with loose practices by separating the 'signs' associated with each religion. Yet no single version of these religions emerged, though some versions were more hegemonic than others. Nor did they manage to actually produce homogeneous 'monolithic undivided communities' – virtually no single regional and/or jati cluster coincided with a single religious affiliation (as the censuses of the late nineteenth and early twentieth centuries bear out).

However, the docketing and labelling of different religions – produced in the interaction of colonial administration, class formation and politically vocal community claim – often made from communal positions – did form a descriptive overlay that muffled a far more extensive, unclassifiable diversity. It also assisted the gradual erosion not only of the diversity within these religions (largely loose constellations of denominations, sects, orders, movements) but also of their common histories, overlapping beliefs and practices, their many interlaces and the many in-between areas that have been thrown up through continuous interaction and contiguity.⁵ It involved ignoring

religions or belief systems that were unable to spawn communities. In this sense clear cut division assisted the voracious incorporation of a number of diverse sects and practices into the subsequent legal definitions of a 'unified' Hinduism or Islam,⁶ said to constitute internally coherent cultural communities and helped to set them up as opponents.⁷ Ironically, it was this severely limited definition of religions, one that was in fact implicated in the partial erosion of extant religious diversity, that is today going under the names of religious plurality and/or cultural diversity. I will return to this later in the essay.

(2) ON SO-CALLED INERTIA OF RELIGIONS

The very notion of a mechanical replication or reproduction of *monolithic sealed* religions is, in historical terms, a falsification. Religious pluralism in India is not 'multicultural' – in the liberal usage of the term – that is, as a physical agglomerate of *discrete* majority or minoritised identities. (This may in the future be the end product of intense communalisation.) Rather, religious pluralism must be characterised as a network of overlaps and differences as well as a field of interactions, and it is this which has made religious practices relatively more resistant to homogenisation, though not of course immune to it.

Further, a dialectic of change is at the heart of the formation of communities. They are made, unmade, recomposed, pulled in several directions. And of course they need not be made on religious lines at all or be an 'effect' of religious beliefs. Both in the past and in the present it has been possible to be religious without belonging to a community: there are innumerable instances where even shared belief, for instance in a pir or a guru, does not constitute a community. Not only did every variant of religious belief not produce a concomitant 'community' amongst its followers but there has been active resistance to religion and/or caste based primordialism and institutions in medieval bhakti and sufi cults and some of their latter day successors. The religious history of the subcontinent has been one that has frequently honoured and enacted the twin principles of personal choice and of resistance to religion and caste based primordialism and accompanying forms of institutionalisation.

If religion has been an arena of birth, bound obedience, it has also been one of individual volitions. To change from one belief to another clearly defined belief, to mix-up beliefs and religious repertoires, to hold concurrent beliefs, to choose beliefs from a non-primordial set, to allow beliefs to strengthen, weaken or fall away – these are processes of choice and selection that from a historical point of view have informed the creation of religious orthodoxies as well

as the opposition to such orthodoxies, and have featured in both 'tolerant' and militant traditions. It is these possibilities that have been one of the preconditions for the prodigious subcontinental proliferation, over the centuries, of subsets and sects within religions as well as of the emergence of new religions that both drew from and broke away from older religions. Whether the many Hinduisms, Islams, Sikhisms and in-between variants are indeed subsets of the 'major' religions, that is, constitute a diversity *within* a wider boundary, or are distinct overlapping affiliated religions that in fact defy boundaries, still needs sustained historical explanation.

At any rate, this fluidity not only calls into question the contemporary privileging of the strategic, organised identities of religious primordialism in the social and legal domain but it also calls into question any static definition of religion. Because generational choices and changes have been a continuous feature, it has been possible on the retroactive basis of past generations to see some degree of *change* as a living social *project*, even when it was not personally available or desired. Consequently, this same fluidity has been an object of foreclosure or pre-emption in different conjunctures. It has even determined the recurrence of an extraordinary prescriptiveness, the emphases on socialisation of every generation afresh in order to guarantee the reproduction of religions, as well as increases in orthodoxy whenever avenues of choice have increased. A workable notion of religious plurality would have to take into account the processes of both change and fixity, as well as the conjunctural availability and/or proscription of choice for individuals or groups.

(3) COMMUNITY, COMMUNALISM, CAPITALISM

The tendentious nature of the concept of religious community that I have set out to critique becomes even more apparent if two of its major locations are examined: that is, a defensive placement in relation to Indian communalism and to capitalism. This defensiveness, which accounts for some of the effective appeals of the idea, is replete with anti-modernity sentiments and even carries some valences of left utopianism. I will argue that the first is misplaced and the second misleading.

The most aggressive 'community formation' in India today is Hindu majoritarianism: its communal violence has tightened the grip of religious community as the language of assertion on minorities. However, a defensive relation to 'religious community', even when it comes from a genuine sympathy for beleaguered minorities, cannot effectively challenge majoritarianism and may even strengthen it. This is because arguments either based on or supporting primordial religious community

and impermeable boundaries between religions are similar in many of their premises and procedures to those of the Hindu majoritarianism they have set out to oppose. To assent to 'Islam' is tacitly to assent to 'Hindu' and vice versa. Further, Hindu majoritarianism thrives in a political arena dependent on or mortgaged to competing 'community' claims since it is itself invested in building and encasing an 'inter-community' competition through ideologies of Muslim male virility and uncontrollable demography. Finally, a defence of the idea of religious community reinforces the structural relations between religions and patriarchies, and sharpens the emerging relations between religions and communalism.

The idea that religious communities can provide a bulwark against capitalism popular among indigenist intellectuals seems, at least in India, to be equally misconceived. Their positioning of 'community' – as a sign of an 'unhomogenised' localism or as mark of the precapitalist still resistant to capitalism and its ideologies or as a sign of autonomy vis-à-vis the nation-state – is naive and untenable. Religious communities are neither local nor precapitalist, nor have their 'leaders' ever made such claims. The processes of community formation would be difficult to separate from the rationalities that accompany and legitimate capitalism while community claims often have a politically transactional character. In recent decades there has been a notable intensification in the commodification of religion: a closer alignment of religion with capitalist processes is visible in the proliferation of sites of institutionalisation (e.g. temples, *deras*), personnel for exploiting them (*sadhus*, *mahants*) and funds (e.g. national and international donations to temples, *gurudwaras*, the VHP).¹¹ Indeed what is called a religious 'community' may, at certain levels of its local, national and/or international organisation, amount to economic and institutionalised structures of profit relying simultaneously on intra-'community' exploitation and consent. At many levels communalism and capitalism become compatible rather than opposed terms. Further, the complicity of the (far from secular) state with a version of 'community' espoused by the 'leaders' of different religions as an electoral device, is so notorious that a defence of community now ironically runs the danger of colluding with the state.¹²

Religious communitarianism, as a projection of anti-modernity, is not an answer to capitalism either within advanced capitalist countries or when prescribed as panacea by intellectuals from 'third world' countries. Anti-modernity has been a dogged companion of European modernity with different ideological locations for instance, as liberal angst over 'western' technology,

hyperindividuation and the onslaught of the market, or as romantic strand in nationalism that located a primordial and essentially unchanged identity in the past, or as a conservative modernist lament for the lack or disappearance of authoritative cohesive religious systems and organic communities, or as a right wing critique of capitalism predicated on utopian visions of the premodern.¹³ Even if the quality of belated rehearsal in turning towards religious communities in India to provide depth and meaning accruing from tradition is put aside as a type of nostalgia, the standpoint of these invocations as critique of modernity, in a situation where capitalism under the auspices of international monopolies and imperfect market competition continues to produce skewed development and pauperisation, where the procurement of basic necessities and the implementation of basic rights is not achieved, and where communalism is intense and violent, still remains open to critique. The effort to contain modernity is odd in a country which has yet to acquire the material coordinates of modernisation, and where the ideological modulations of commitment usually spell soft communalism *status quo* for the masses, regression for women and/or anti-feminism. There is also the further oddity of a neo-conservative critique of western liberalism in a social formation where liberalism itself is not entrenched, and where liberal values have often acted as a defence of the limited and beleaguered freedom that women require to struggle against old and new conservatism.

The recourse to valences of left utopianism by defenders of religious communities in India are at once inappropriate, more affective than substantive, and stripped of their political intent. One type of left utopianism has viewed specific forms of human collectivity and community in ideal terms as an intrinsic principle of bonding which does not produce fear or fear and stresses commitment to fellow human beings. This seems peculiarly inapposite when applied to *religious* communities as such, and even more so to the type now obtaining in India which are usually formed on political self-interest, on aggression and othering on defensiveness and fear. While there is an undeniable value in human communities as a non-contractual, anti-market principle of social bonding that can function as an antidote to a dehumanising capitalism, it does not follow that we should now proceed to privilege an obligatory birth-bound religious community over and above collectivities that assume rights of entry, exit and chosen affiliation for their members. But I add that if utopianism is still desirable then how come non-religious challenges to capitalism like the socialist-feminist that uphold and struggle for a utopian principle and forms

of bonding, are not equally or more desirable? Maybe, because the valences of left utopianism carried in this tendentious choice of religious communities as the specialised markers of being outside exchange and the market above other primordial claims and chosen affiliations have been relocated in even recruited for an anti-Marxism, and of a type that is deeply indebted to orientalism and to some of the worst ideological sectarian tendencies in nationalism. This is to say the least somewhat paradoxical since the explicit targets of many indigenist and postmodernist defenders of community also happen to be colonialism and nationalism!

It may be more productive, though less popular to speak of communities not as 'given' on religious lines but to speak of the political, economic and electoral processes that are producing and privileging this particular sort of community and facilitating specific types of ideological investment in it. It would then follow that secular feminist interventions could be directed at these processes and not confined to finding just means of arbitration between 'given' pre-formed religious communities (a nagging reminder of colonial policies even if partly justified by the present situation).

(4) RELIGIOUS AND NON-RELIGIOUS COMMUNITY CLAIMS

The question of religious community cannot of course exhaust the issue of primordial community. Primordial community claims co-exist or intersect with claims to non-primordial collectivities – class, work and occupational identities, forms of contiguity in neighbourhoods and villages – which along with gender, have been the bases for non-community specific mobilisation. Many contemporary 'community' claims themselves are not claims for cultural autonomy alone but simultaneously a contest over the distribution and appropriation of resources and a feature of political organisation. If the issues of material resources and political power were to be equitably resolved then the substantive content of cultural autonomy would be different. The democratic assertions in some claims based on community as in the case of dalits, in fact intersect with and even rely on other forms of collectivity. Their invocation of 'material interests' is often a strong notation for or emphatically indicates identities premised on class-based non-primordial aspects of social identity and the exploitation of labour.

Other forms of collectivity exist alongside in tension or even in a struggle with primordial community claims precisely because the social economic and political forces of capitalism in India pull in both directions. Should we strengthen those

existing or possible political arenas where social inequities can be challenged without invoking or consolidating primordial religious identity and where primordial affiliations can be downplayed or should we as present community-identity and communal politics would prefer force them to remould or discard their agendas in favour of religious communities?

The question is further complicated by the fact that despite increasing communalisation even now religion is neither the only basis of primordial community claims nor the only practical and symbolic co-ordinate of political mobilisation on primordial grounds. In fact religion does not have the foundational status ascribed to it by intellectuals and claimed for it by community spokesmen. Politically volatile or active community claims (that subsume myriad and diminutive primordial communities) on the basis of geographical territory or region, caste, tribal identity, broad linguistic distinctions (such as Hindi or Urdu) as well as narrower linguistic distinctions (such as local dialects) are being made alongside those based on religion whether configured as broad pan-Indian denominations such as Hinduism, Sikhism or Islam or as smaller particularised sects.

Now if we were to imagine forms of decentralised legal pluralism based on these primordial community claims several problems would arise. Would a *single* basis for definition such as language or territory or caste or religion be compatible with justice? And if so what would be the rationale for suppressing all other conflicting claims? Why for instance should a caste-based community claim be less valid than a claim based on a major religious denomination? On what basis, if any, will any one of them be prioritised and how many will such a prioritisation satisfy? Even in the abstract religion would not qualify as a contender for differential rights on the ground of unilateral past victimage and historical wrong. At present the most dubious but vociferous claim of victimage and assertion of a violent 'righting' of historical wrong is coming from Hindu majoritarianism though by far the greatest historical wrongs have been to low castes and tribals.

Settling for legal pluralism on any *one* primordial basis brings up the irresolvable paradox of differential rights: the notion of 'right' if it is to be legitimate must be potentially universalisable, e.g. right to education to work to vote. So differential rights based on a primordial claim would keep creating new grounds for inequality and dissent even as they set out to resolve some existing areas of conflict. And in such a situation there would be logically no recourse to a language of common potentially universalisable rights whether as basis for possible equality or as the *basis*

for conflict resolution and arbitration or as basis for instituting need-based particularist rights or even as a *means* for calling the state to account.

It is important to argue this because it would be literally *impossible* to institute a 'decentralised' legal particularism on the basis of *all* primordial community claims – religious, sectarian, linguistic, territorial, caste or life-context. This would be a self-cancelling procedure since the sheer multiplicity even of politically articulated claims would throw one back ironically on notions of the individual and individual rights.

Each and every basis or definitional category for primordial community claims is fissiparous and open to further subdivision either on the same lines that is more and particularised units of any one category, or through being undercut/cross-cut by other categories. Thus a linguistic or religious community can fracture within the country on lines of dialects, sects, castes, region of origin or residence, class, language and soon while diasporic location of Indians can further fracture primordial groups and set up new logics of differentiation on grounds of nationality and assimilation of local culture.

Again few of these communities will now or in the future exist on co-residential, contiguous or interpersonal bases not only are languages, castes, religions etc. widely distributed over India and even internationally but spatial distribution relocates them in different economies and in locally varied hierarchies. Not only does spatial distribution de-territorialise communities and community claims in the simpler senses of dislocation or migration but new forms of contiguity change the identities of persons thereby altering the meaning of a community claim in its local registers and substantive contents.

Such heterogeneity is not merely a jural or jurisdictional issue which can be solved on a passport model of portable identities that can be carried around. It challenges the very definition of community. This kind of heterogeneity within each nomenclature can be assimilated into a legally defined 'community' only through an artificial *decontextualisation* – by making it a given or pre-formed entity and through *closure* – by making it impervious to change and indeed to the very lability of the continuous processes of identity formation.

Two major conclusions are inescapable. First, any single basis of 'community' will not only be ephemeral or provisional, liable to fragmentation by other cross-cutting affiliations but it cannot represent the full spectrum of social divisions and locations, cultural diversities and aspirations. Second, if all except geographical territory is movable or mobile, if even claims to territory can be made at long distance, if belonging

does not involve presence, then 'community' claims are disguising a very real heterogeneity – they are in fact at this level hardly, or not at all, claims for recognition of existing cultural plurality. They are claims for homogenising groups of people who have one notional thing in common into mobilisable discrete units, that is, they are seeking homogeneity but are not *a priori* based on it. This is true as much of pan-Hinduism as of pan-Islamism.

II

Community, Religion, Women

(5) COMMUNITIES, PATRIARCHIES AND RELIGIOUS IDENTITY

The broad ideological conception of religious communities has uncomfortable implications since religious 'communities' are not only inequalitarian or class differentiated but also specifically undemocratic regarding women. Community identities can be as much punitive as protective for women, and that too, protective on patriarchal and proprietorial assumptions. If, as the more extreme arguments for reform of personal laws from 'within' seem to desire,¹⁴ communities were to legally govern, reform and adjudicate themselves, taking full responsibility for being either agents of change or protectors of the status quo, what will prevent them from trying to be self-legislating patriarchies; from strengthening local, interpersonal patriarchal control; and from continuing to hand power over to mullas, priests, pandits or other chosen interpreters? There is little evidence to show that communities are committed to internal democratisation of gender differences. And if such democratisation will remain as pressing an issue (if not more pressing), even after communities have retained or achieved some measure of legal autonomy, then why not simply struggle for a thorough-going democratisation on wider non-denominational principles of collectivity, in the first place?

Women's own religious beliefs, consent to a religious identity and community as well as their agency in maintaining these, are often presented as a rationale for maintaining personal laws and reforming them only from within. This is a complex issue, partly because it can be argued for women from beleaguered minorities as well as from the chauvinistic majority.

In certain kinds of contemporary analysis, overly anxious to establish that religion is not false consciousness, religion is simply turned into a matter of faith or belief alone, thus eliding the issue that religion prevails as an *institution* more than consciousness, true or false. This formulation not only serves as a catchall but irons out the complexity of the relations between gender and religion; it is then followed by the

proposition that religious belief is giving agency to women. More often than not, the implication is that the presence of such an agency for women makes secular feminism questionable or even redundant. Thus a pernicious continuum is made between primordial denomination, women's belief and women's agency.

As a result, some serious questions are never asked. What is the nature of women's consent? When they consent to the punitive aspects of religious identity or community are they in fact consenting to the patriarchies with which these are meshed, or vice versa or both? Or, is their consent effectively consent to the host of other social factors in which both religions and patriarchies are enmeshed? Thus women's consent to religious definition may go beyond questions of individual faith and reflect the ways in which religions and patriarchies are articulating with other social structures. Should we confuse women's consent to patriarchal assertions of community, their inability or fear to step out of these, in this particular political conjuncture with the sum of their needs and aspirations? For instance women's consent to Muslim community and to Hindutva enacts very different and antagonist relations of power; while women's active investment in Hindutva (a complex historical, political, economic, class/caste differentiated and conjunctural phenomena), may have little to do with religious belief *per se*. Instead of conflating such consent with 'feminist agency' (a current preoccupation with some anti-communal feminists), a different type of analysis could be undertaken. Women's consent to a patriarchy has in the past and still does empower them for *selected* forms of social agency; further, this consent works through appropriating available hegemonic and/or legitimating languages thereby forcing these languages into new ideological locales and pushing their previous proponents into more stringent political self-definition or at worst, into apology and retraction.¹⁵ Or to give another instance, many Muslim women may be caught in a double impasse: first, because a uniform civil code is seen to endanger the identity of physically endangered Muslims, the very claim to gender equality now implies disloyalty or antagonism towards the community;¹⁶ second, belief in Islam now appears to entail being prepared to accept patriarchal personal laws.

It is argued, in discussions and in writing, that opposing minority personal laws denigrates the laudable efforts as well as subsumes the initiatives of women involved in reforming personal laws from within. Undoubtedly, some Muslim and Christian women have religious yet reformist standpoints, oppose a uniform civil code, and, as believers, struggle to remove some gender inequities or 'corruptions' from their

personal laws. I believe that the issue need to be posed differently – it should be disentangled from belief and concentrated instead on the nature and pitfalls of reform from within. Second, we have to determine if the strategies of religious reformism from within also have space for those other women who may or may not be believers, but find consent punitive, or who find primordial belonging an impediment to choice, if not an imposition, or who do not consent,¹⁷ or more to the point, who *need alternatives* in order to dissent in an effective way. This is important for two reasons. A feminist politics must account for women's consent to patriarchies, but it can scarcely afford to give political or theoretical primacy to women's will to consent to forms of social oppression *over and above* their will to contest these; since such a primacy is already on offer by a standard form of male conservatism.¹⁸ Nor can feminist politics take on board a divisive (or for that matter a unifying) politics based on essentialist identities whether primordial or biologicistic.¹⁹

(6) THE QUESTION OF REPRESENTING 'OTHER' WOMEN

In this context, confining women to community identity and personal laws becomes a way of dismantling and pre-empting cross-denominational or extra-religious feminist collectivities. Against the potential dangers of representing 'other' women, that is women of other denominations, we must place the dangers of refusing to represent each other. Refusal of a common ground of struggle is also a form of othering. Particularism can be segregationist in its logic. Unless universality is granted in principle (though not necessarily as a strategic mode of organisation) as the possibility of mutual representation, feminist groups run the danger of replicating the structures of communalism.

The right to scrutinise and interrogate our entire social milieu is a democratic right for all and one that is particularly crucial for feminists, and this cannot be a right confined to or reserved for one's own primordial denomination. If it is suspended in the name of religious community,²⁰ then it will prevent women from criticqueing a significant determinant of patriarchal oppression in India, namely religion. Indeed it may altogether silence women – some in the name of belonging and loyalty to their religious group, and others because they have no 'right' to speak of any religion but their 'own'. It is ironic too that inhabitants of a subcontinent, rich in irreverence, in both *comparison* and *critique* of religious philosophies, hierarchies, institutions and practices that were not limited by personal belonging, as well as rife with oppression in the name of religions, should now be

asked to piously desist from criticism of any but their 'own' religion, within the rubric of a postmodernist politics of (self)-representation. Not only does this version of postmodernism, when transposed to the question of Indian personal laws, become unfaithful to its basic tenets of deconstructing the demarcation between within and without, but it ignores the material evidence of the fluidity of religions that I have discussed earlier. More significantly for feminists, this proposition of self-representation rests on a proprietorial view of religions (and as a corollary, even separate 'life-worlds'), as the exclusive property of particular groups, and as I will discuss later, one in which assumptions about owning religions 'naturally' extend to ownership of women.²¹

The women who are (or are sought to be) united on the bases of systemic, overlapping patriarchies are nevertheless simultaneously divided along other lines. Three such divisions are pertinent to my argument: first, by class, overdetermined by caste, and the accompanying power to oppress other women and men; second, by consent to patriarchies and their compensatory structures and an accompanying delegated power to oppress other women; and third, by the choice of a right-wing politics that gives them a political armoury for 'othering' men and women from other religions.²² And here, the way in which feminists take up particular issues determines whether they are or are not classist, casteist, undemocratic or compromising with patriarchal arrangements. If they are, then, and only then, do these turn effectively into divisions among women, instead of being, as they should be, divisions that must be challenged by feminism.

I do not think, however, that differences in religious faith can by themselves produce equally significant divisions between women. The particularity of religious belief need not by itself either constitute a division along lines of power or alter the distribution of social power. To the extent that all religions are implicated in and enter into the broad process of social legitimisation of patriarchies, a challenge to patriarchies constitutes a threat to specific forms of religious legitimisation. In this regard religious affiliation makes a difference to women but need not produce a conflict between them; especially if women are willing to question the casteist or communal discriminations that inhere in some religious practices and are ready to consider that aspects of religions may be working to reconcile them to patriarchal oppression.

It is only when religious affiliation is translated into a politics and is aligned with institutions that maintain forms of power and privilege that it has the capacity to divide women. Thus, the institutionalisation and communalisation of religions have acted

as a powerful divisive force aggravated by the involvement of some women in entwining religion with the politics of the Hindu right. The right wing appropriation of feminists' agendas or the language of citizenship and democracy is not unique to India and its function here as elsewhere is to divide and derail left, democratic, feminist agendas.

If this is an acceptable line of reasoning then the question arises as to why we should recede from a secular democratic agenda and from a commitment to common struggles? The divisions among women along lines of class, consent and political choices have to be fought through persuasion and/or political confrontation, not through a capitulative politics of difference, exclusivism or hyper-particularism.

One issue posed by feminists in the light of the recent riot-torn communal situation is whether gender unity can withstand communal hostility. Feminist groups, Flavia Agnes argues, are already overinflected with 'Hindu' assumptions – an evidence of this overinflection is their past failure to mount a thorough-going critique of Hindu personal law – and cannot be isolated from the wider political contradictions; moreover, she argues that in the aftermath of the riots, women do not have a separate existence away from their communal identity where legal issues can be discussed on a common platform.²³ Her argument may fit well with another argument claiming that at present religious identities have acquired a pre-eminence and the only way to break out is by working within them or by 'negotiating' them. In practice this could mean that the patriarchal systems operating in the country may henceforth have to be separately opposed by women from within different denominational groupings, while the range of these groupings could now expand beyond designated minorities and stretch to women opposing patriarchal practices from within the fold of Hindu communal organisations. If so, we will be unable to address the fact that the political play of denominational 'communities' with its logic of aggression and defence impedes women's individuation, and now being added on to inequalities in waged and unwaged work as well as in inheritance, is driving women further back.

I think the question of why women consent to religious definition and the answer to this question, as well as the path to a common politics, hinge on our understanding of patriarchies: on the way patriarchies are embedded in or articulating with class structures, caste-class inequality, religious practices, wider dialectics of social legitimisation, and other political formations. It is only if we see patriarchies as self-sufficient, unrelated to each other, isolated from wider social processes, and determined by religion alone that we can support singular, separate struggles against them

along denominational lines. If we see them as part and parcel of the wider social formation then we have to devise modes of organisation and struggle that can encompass all the social inequalities that patriarchies are related to, embedded in and structured or enabled by. Attacking patriarchal oppressions is not a sectoral issue confined to women but central to any agenda for social change. Can we afford yet again to separate the 'women question' from a wider struggle, and this time as victims of the divisions enforced by communalisation? If feminism is to be an egalitarian, democratic and secular force allied with other such forces, then this, along with the very nature of patriarchies (to which I will return), requires a common politics.

(7) COMMUNITY, STATE, RELIGION, PATRIARCHY

It is untenable to draw a sharp line between community and state on either the question of religions or of patriarchies since there are structural, ideological, political and administrative linkages between the two. Indeed the kind of religious communities discussed here have been constituted precisely in relation to the state.

The separation between state and civil society rests on an *analytic* distinction. At a structural level, they can and often do interpenetrate – state structures can be replicated in family or community. The family's patriarchal arrangements, like that of a community, though in somewhat different ways, can be complicit with the state and its juridical institutions.²⁴ The relation of the state to women is patriarchal, undemocratic and class differentiated: the state has persistently defined women in relation to men, used and made labour grids, perpetuated the invisibilisation of domestic labour, governed both land relations and distribution of resources, enforced the rule of property in ways specially unjust to women, created class and gender inequities through 'development', reproduced women's economic dependence, co-opted many women's initiatives, and is now (with the new economic liberalisation) withdrawing from its welfarist functions (which could have mitigated the patriarchies operating in family, community and workplace).

At the political and administrative levels, it colludes with 'local' and 'community' patriarchies. A triangular relation has obtained between personal laws, 'representatives' of a community and the state.²⁵ It is possible to trace a history of both tussle and co-operation between the community and the state's control at different times. Effectively, however, though a demand for separate shariat courts has recently been made, it is the state which administers all the personal laws. Further, the state itself has built loopholes in laws and has sustained discriminatory laws, including personal laws, in order to water

down the constitutional horizon of gender equality. Its own collusions frequently contradict its stated reformist aims. It has tolerated patriarchies in the state apparatus (e.g. police and judiciary), and barely implemented the better laws that do exist.

Similarly the state has supported patriarchal interests on religious grounds both ideologically and in practice. There is a long history not only of representing the defence of patriarchal arrangements, privileges and/or the sexual regulation of women as the *defence* of religion but also of the interested representation of patriarchal arrangements as religious *rights* by 'community' spokesmen. Virulent instances, from every denomination, whether minority or majority, can be found in the debates surrounding the Special Marriages Act, the Hindu Code Bill and the Uniform Civil Code.²⁶ The coding of patriarchy as religion by community spokesmen has been and is by and large shared by the state which selected *denomination* above differential class, caste and regional practices and above an uncompromising secularism as the primary basis for defining family laws. Insofar as personal laws curtail women's rights they define and defend male privileges; only the institution of women's rights can dismantle them. Thus male privilege is preserved in personal laws through coparcenary provisions, male testamentary rights, unilateral divorce, bigamy, restitution of conjugal rights, inadequate maintenance, lack of residence, guardianship and custodial rights for women.

Another major dilution of the line between state and community has occurred in the way the state has been called upon to maintain religious boundaries, and has often done so despite the fact that it had successfully established itself as the authority that could 'allow' people to opt for laws (such as provisions in the CrPc) other than their personal laws.²⁷

The state has been asked to *protect* religious boundaries in two different ways – through demands for exemption by minority religious spokesmen, and through demands for a uniform civil code by Hindu communalists. I will argue that despite differences, *both* have *de facto* functioned as demands to close boundaries, deny possibilities of individual exit, and ensure the internal cohesion of a religious 'community' through appropriate laws. (This also raises a question about whether so-called religious communities are indeed internally cohesive, since asking the state to ensure community cohesion through laws suggests that they may in fact be tenuous or precarious.)

In a mode similar to earlier Hindu protests upon the introduction of an optional civil law on marriage and divorce, which lasted from the 1860s to the 1950s, Muslim

religious spokesmen have also persistently perceived the very institution of enabling, optional civil laws as threatening. Their objection to the Special Marriages Act (1954) rested on the belief that its presence would encourage Muslims to circumvent their religious laws and obligations and they asked for exemptions that were not conceded. A similar demand for exemption was made (along with tribals, and later with a section of Parsis) regarding the proposed Adoption of Children Bill (1972). With the notorious Muslim Women's Act, the government helped Muslim religious leaders by blocking off the access of divorced Muslim women to the minimal yet relatively more liberal provisions for maintenance in the CrPc.²⁸

The Hindu communal demand for a uniform civil code, as for instance following on the recent conversion/bigamy judgment, is an attempt to abolish personal law so that Hindus cannot convert and thereby gain access to Muslim personal law. It is not as if Hindu communalists are seriously invested in removing bigamy as a patriarchal practice prevalent among Hindus. Rather, they object to Hindus gaining legal access to polygamy through conversion. That is, they object first and foremost to Hindus choosing to become Muslims. (There is an especial ideological embarrassment here: how will the Hindu right pose as the liberator of Muslim women from a patriarchal personal law if Hindu men are converting to Islam for the sake of polygamy?) And secondly they wish to equalise male privileges.

Hindu male opposition to Muslim personal laws has most frequently been made (in the past as well as now by the BJP) on a competitive patriarchal ground of equivalence of male 'rights' – either the state should encroach on the patriarchal privileges or 'religious rights' of all men or of none – and is suffused with male jealousy.²⁹ The prehistory of current Hindu male opposition to Muslim personal law lies in their failed attempts to fully protect male privileges in the 1950s. In the debates on the Hindu Code Bill, Hindus had not only defended polygamy as having shastric sanction, as being a means for fulfilling the ritual necessity for sons and thus of ensuring spiritual benefit, but had also administered a warning to the effect that if polygamy became illegal Hindu men would have to convert to Islam to marry more than one woman or would be forced to keep concubines.³⁰ The confusion between spiritual benefit and male promiscuity must have been amazing. If men could be willing to renounce Hinduism and convert in order to have more wives then surely male privilege must be stronger than primordial loyalty, since presumably all spiritual benefits would be lost on conversion!

In recent judgments, the judiciary has also assisted in closing routes of exit from

personal law. In the 19th century, and even until the 1930s, conversion of an individual, family, caste group or community to either Sikhism, Islam or Christianity did not always lead to a change of personal law which was in part retained and engrafted as a custom on personal law.³¹ Since 1887, personal law had applied only in disputes between two people of the *same* religion, whether by birth or by conversion, and ceased to do so if one party converted; subsequently, if a personal law was still applied to such a dispute it was for discretionary and contextual reasons, that is, because it was more conducive to justice and relevant in specific cases. This principle of arbitration has been gradually eroded. A tendentious 1983 judgment gave an unprecedented, formulaic, virtually religious sanctity to Hindu personal law by insisting on a supreme and unchangeable regime of primordially Justice Leila Seth of Delhi High Court ruled in *Vilayat Rafi v. Shilpa* not only that if a Hindu spouse converts to Islam the marriage could only be dissolved under the Hindu personal law in which it was solemnised, but further that "even if *both* the parties to a Hindu marriage get converted to a religion other than Hindu, their earlier Hindu marriage can only be dissolved under the provisions of the Hindu Marriage Act (1955)". An indefensible and dubious extension of the Special Marriage Act (which was meant for inter-religious marriages and justifiably allowed dissolution of marriage, conversion notwithstanding, only under the same Act), was made to Hindu personal law.³²

The consequences of such precedents are visible in the Supreme Court judgment on *Sarla Mudgal and Ors vs Union of India* (1995, 3 SCC 635). This being a dispute between a husband converted to Islam and his Hindu wife – the court could have used earlier precedents in which neither Hindu nor Muslim personal law was applied and sought the remedy in secular laws governing divorce and bigamy under which the offence was already punishable. Instead Justice Kuldip Singh invalidated the application of Muslim personal law through an argument of claims and counterclaims, sought a practical remedy in an application of *both* Hindu personal law and section 494 IPC³³ but rested his statement on an ideologically loaded reinforcement of religio-legal boundaries, in which the very existence of Muslim personal law was represented as an encouragement for Hindu bigamy.

... till the time we achieve the goal - Uniform Civil Code for all the citizens of India - there is an open *inducement* to a Hindu husband, who wants to enter into a second marriage while the first marriage is subsisting, to become a Muslim. Since monogamy is the law for Hindus and the Muslim law permits as many as four wives in India, an *errant* Hindu embraces Islam

to circumvent the provisions of Hindu law and to escape from penal consequences [my emphasis]

He seems to forget that the major inducement to bigamy is not legal pluralism but male privilege and that most instances of Hindu bigamy occur without conversion.³³ The judgment invokes a familiar comparative schema between men of different communities: legal change is advocated to suppress Muslim polygamy and Hindu conversion, but bigamy is scarcely an issue in its own right. Instead the rhetoric of the judgment absolutises the rule of Hindu personal law: overdramatises conversion,³⁴ and in what is obviously a complementary move, demands a uniform civil code. A principled attack on bigamy would have distanced itself from Hindu communal rhetoric, confronted gender inequality and all prevailing patriarchies, sought to improve secular laws on bigamy, divorce and intra-community marriages and critiqued the ambiguities of Hindu personal law that assist bigamy.³⁵

Muslim religious spokesmen want to close all routes from Muslim personal law to common laws through exemptions. Hindu communalists want to block any route from Hindu personal law to Muslim personal law by abolishing personal law. In each case the very existence of other laws seems to undermine community. Though from apparently contradictory positions – the former from a position upholding existing legal pluralism and continuation of Muslim personal law but opposing any further pluralisation by way of either optional or common non-religious gender-just laws, the latter by demanding legal uniformity and abolition of personal laws – both want to foster exclusivity, foreclose choice and movement from personal to non-religious laws (for Muslims) or traffic between denominations (for Hindus). Both want to harden and freeze boundaries. Hindu communalists are, in addition, committed to attacking Muslim legal particularity even if it is at the cost of uniform civil code. And the reason why they express little concern about losing their personal law is that they assume that the Hindu personal law will be the model for a uniform civil code, so that *only* Muslim legal particularity will be eroded.

Evidently the acts of defining as well as the definitions of religion and community are predicated on patriarchal privileges, and the state has more often than not been complicit in these because the state itself is implicated in patriarchies: in the exploitation of religious identities and in encashing denomination for electoral purposes. For instance, though the state did not accede to a continuation of polygamy in the Hindu Code Bill in the 1950s, it did introduce some new clauses with no textual religious sanction that made conversion

legally punitive for Hindus. These are based on the non-secular assumption that different religions cannot co-exist within a family: conversion is a ground for immediate divorce in the Hindu Marriage Act; the Hindu Adoption and Maintenance Act decrees that only Hindus can adopt Hindus; a widow cannot adopt a Hindu child if she has converted, and a wife is not entitled to maintenance if she ceases to be a Hindu; the Hindu Minority and Guardianship Act rules that ceasing to be Hindu will deprive either spouse of their claim to guardianship of their children; while children and descendants of a convert lose their claim to the property of a Hindu relative unless they are Hindu when succession opens.³⁶ It appears that religious primordiality was more important than primordial ties based on kinship: family and nurture further conversion is assumed to produce grave incompatibility or repugnance while a change in belief is equated with vicious misdeeds. The state also communalised the Special Marriage Act in 1976 along similar lines.³⁷

Since communities have themselves become a device which helps the state to mitigate class polarisations and to opt groups, it is doubtful if consolidating religious communities can 'challenge' the state. In this sense a multiplication of community rights over and above those that already exist (freedom to worship, to open schools and to practise personal laws) may well assist the state but are not likely to guarantee the full protection of the civic and democratic rights of minorities. And the maintenance and institution of community rights over and above or opposed to the rights of individual women whose form half of every community is likely to intensify male privilege. Since defense of community rights has been an undemocratic way of enhancing individual male patriarchal privileges, it is unethical to support them especially in the name of democracy.

(8) COMMUNITY VERSUS STATE: PROBLEMS OF REFORM FROM WITHIN OR ABOVE

The absolute and binary opposition between state and community on the question of personal law is false; it needs to be dismantled and reconstructed as an argument for the rights of all women. For that matter, the opposition between community and nation on the question of personal law is equally misleading: if a uniform civil code has sought legitimacy from a concept of nation as a homogenous entity, the personal laws have also sought legitimacy from another concept of the nation as a conglomerate of discrete 'major' religions defined through equivalent reductions and homogenisation. However, since the issue has been frequently posed in this way, it has acquired a contentious resonance that first needs to be addressed on its own terms.

Beneath the opposition between a state-

imposed uniform civil code and personal laws that are sought to be reformed from 'within' a community (and the related opposition between reform of personal laws from within and from above by the state) lies an unresolved but entirely patriarchal concern: who will control and regulate women and in whom will the agency for reform be vested? Is patriarchal control and/or reform to be exercised by the state and its institutions or by the community? Will community control act in tandem with the state or independently of it, as in the recent demand for separate shariat courts?

The choice between personal laws and a so called uniform civil code: at one level appears to hinge on a choice of patriarchal jurisdictions. Does this choice have any meaning for women? Will the jurisdiction of 'community' representatives usually male, functioning either independently or through a surrogate state be preferable to that of an impersonal state? Significantly, the experience of reform of personal law from within, has in the case of Christians met only with procrastination from the state,³⁸ while for Muslims it has been one of entrenchment of religious elites and a 'community' patriarchy complicit with the state. The reform of Hindu personal law from above by the state did challenge religious elites³⁹ but culminated in the promulgation of patriarchal laws by the state instead.⁴⁰ The legitimacy of the state is dubious whether in supporting reforms from within or in reforming from above. In both reform of personal laws is a bargaining counter for the state which retains the power to decide whether or not to reform the personal law of any community.⁴¹

Posing the question of laws in binary terms of community versus state thus is pre-feminist and carries the patriarchal legacy of male reformism. Nineteenth-century male reformism: it must be remembered was invested less in eliminating patriarchies than in reformulating them. It is pre-feminist in the way it elides feminists⁴² as agents of choice, decision and change and makes state and community the major actors. Indeed it is only if feminist agency is omitted or denied (or restricted to the primordial religious group), that the question can be turned into the male-reformist one of whose patriarchal jurisdiction women should come under or posed as one of whose patriarchal jurisdiction will be a *better* option: that of community or of the state.

Till now, feminist initiatives to reform personal laws have been baulked as often by the state as by the pandits, mullas or priests who supposedly represent the 'community'. In my view, *any attempt to either reform personal laws or to make new common laws with a feminist agenda* will come up against both the state and religious 'community' patriarchal arrangements.

For women, community jurisdiction is as problematic as the state, the patriarchies of neither are acceptable. The former is grinding because it intensifies the difficulty of daily, local, interpersonal relationships, making it difficult to claim democratic rights contravened by personal law. The latter involves problems of implementation functions through a self-contradicting, increasing delegitimised, often coercive and patriarchal state machinery.

A major difference, however, between state and community is that of a theoretical horizon. In personal law, women claim as wives, mothers or daughters and have a schizophrenic relation with citizenship upholding a pernicious opposition between private and public, between being members of a community and having full rights as citizens. Unlike communities the state is theoretically committed to ensuring the rights of citizens as citizens. In striving for new common laws (formulated differently from existing laws by feminists) ratified by the state, women can define and claim a direct relation to the state, unmediated by community, as citizens with fundamental democratic rights, only as citizens can women potentially challenge divisions based on denomination: on public and private, on legal categorisations and seek, if they wish, secular collectivities. If elements of contestation and struggle are fundamental determinants on construction and implementation of legislation then the history of state intervention is also itself partly a history of struggles *against* patriarchal relations institutionalised through the state.⁴¹ Finally, the implicit recognition in the Constitution that religions have sustained and legitimised caste and gender discrimination⁴² led the state to be at once a protector of religious freedom and a reformer of injustices based on religion – this contradiction too can be purposively and subversively used by feminists.

Apart from the risks of isolation and failure, a struggle to reform personal laws from within, puts the onus on a small number of persons.⁴³ While making a bid for new common laws, the complexities of the state in encasing religious differences, drawing on and using particular sets of patriarchal relations, should be opposed, at the same time it should be asked to provide juridical spaces, live up to its arbitrating functions and be held systematically accountable as an agency of change and implementation. Such a strategy would have the added advantage of being a struggle in which feminist, left and democratic forces could join.

(9) RELIGION, LAW AND THE PRIVATE DOMAIN

The orientalisms which flourished in imperialised formations turned religion, which they saw as immutable, into a primary

axis of social classification. One long-standing orientalist axiom was that India in its past and present yields no distinction between religion and law. This ascribed fusion of religion and law, accompanied by a corollary characterisation of the Indian masses as desiring and enacting a cosmic holistic life, is now employed by the contemporary successors of orientalists to defend traditions⁴⁴ of which personal laws are assumed to be a part on the ground that all attempts towards secular laws are intrusive violent and western devices.

The early orientalist identification of religion and law now survives primarily as the identification of religion with *personal* laws and with *religious* community. The present discourse on religious community seeks to make it fully determining in the social legal and political arena. In a characteristic combination of Eurocentric theory and indigenist sentiment this theoretical tendency continues, implicitly to deny to Indians the dignity of choice and political affiliation while subsuming the question of rights, especially those of women, under primordial denomination.

I doubt if the Indian past or present would bear out the orientalist. The undeniably wide sprawl of religion in social life is not identical with the so-called indivisibility of religion and law. From ancient times (as in the Arthashastra and the Smritis) to the Mughal period it is possible to see religion as a mode for legitimating law, kingship and extraction of surplus, that is, to see the very indivisibility of religion and law as an aspect of working and workable ideology. Manipulation of the sources of laws and customs dates back to ancient India.⁴⁵ Plural systems of legal arbitration, the legal force of local non-religious customs, and the lack of coincidence between any single religion and any one legal system also challenge a simplistic conflation of religion and law. It is thus possible to approach the question contextually and contingently, to see how the lines between religion and law were drawn differently at different times, along lines of region, caste and strata, delimiting or extending the purview of religion as the case may be.

I will argue that the present legal purview of religion confined to personal laws that is to matters related to family, marriage and certain types of inheritance and impinging most heavily on the lives of women, certainly puts the orientalist axiom and its modern mutants themselves into the realm of ideology.

From the 19th century the legal purview of religion has steadily narrowed, coming increasingly into conflict with the exigencies of capitalism and its legal structures which seek to promote both individuation and class reproduction. Ambedkar's impatience with the spread of religion in social life and his argument for its legal delimitation came

from the viewpoint that management of class relations and distribution of resources could not be tied to religion.⁴⁶ Since the colonial era there have been successive and cumulative attempts to split religion off from most areas. Male inheritance was one of these: male individuation was sought even within coparcenary systems but female individuation was blocked off in the name of preserving the family and the personal affairs of religious communities.⁴⁷

Religion no longer determines the laws related to the ownership of agricultural land, tenancy, crime, commerce, international relations and so on but is largely confined to laws related to family, marriage and some forms of inheritance, thereby producing an uneasy and unreal division between public and private. Unreal, because in practice the areas in which personal laws operate are interdependent with and related to all the other areas in law and in women's lives: women are governed not by family laws alone but by most other laws; inheritance in different regional and legal combinations⁴⁸ straddles the public and private domain while the legal compartmentalisation of public and private of work and family life is at once illusory since women's family lives and work capacities are completely intertwined and mutually determining as well as utterly prejudicial for women.⁴⁹ Uneasy, because this division simultaneously exonerates religion as a means for the public regulation of private family affairs on the one hand and on the other effectively puts religion into the domain of the private in the sense that its legal purview is restricted to family matters.

Several definitional questions arise from such a division. The peculiar bracketing of laws related to marriage and family as personal laws produces a gendered definition of religion that falls more heavily on women. Does not this display the collective interests of men from different religions in maintaining gendered power hierarchies? The location of religion in the private domain has repercussions too. It serves to transpose the liberal rationale of the family as a private sanctuary ideally beyond state intervention (which has proved so detrimental for women)⁵⁰ onto the religious community and its personal laws. It also shifts the onus of maintaining community identity onto women in marriage and women in familial relations. Finally, this notion of religion assists in the replay of a classic logic, honed by colonial administrators and middle class Indians in the early-19th century in which patriarchies had to be 'at once preserved and reformed',⁵¹ but this time on the ground of personal laws. Is this demarcation of private and public consolingly pre-modern or eminently 'modern'? In other words, is it in fact an instantiation of the clichéd liberal division of public and private, with the public as the

sphere of universality, nationality impartiality equality in the eyes of the law built on consent and the private as the sphere of particularism built on the natural subjugation of women?

It is important to discuss the ideological rationales implicit in several types of conflation of law religion community belief and women that are being made in defence of personal laws and the social diversity they are presumed to represent.

In arguments resting on the conflation of religion, law community and belief, any critique of the bases of personal laws is seen as an attack on community rights on religion and on matters of belief. Yet why should group rights or a sense of community not be rebuilt and claimed on lines other than the patriarchal? If the educational and cultural rights of minorities deserve to be protected why should their or anyone else's 'patriarchal rights' be protected? Or are we going to define patriarchies sometimes as religion and sometimes as culture? Are patriarchies the sole determinants or guarantors of religion? Are patriarchies to be treated as an essential or an alterable part of religion that is does the solution lie in atheism or in reform? Why should a separation of law and religion *per se* undermine either the sense of belonging to a community or professing and practising a religion? If it was the case how come the presence of common laws in most areas other than the family as well as of some secular laws governing the family have not already destroyed religion and belief?

In my view there can only be three implicit rationales for a conflation of religion law community and belief and the corollary fear of any critique of the principles or bases of personal laws. The first is that religion should be ratified by the state as family law. This is fairly dubious and could simply amount to a means for maintaining patriarchies. The second is that once family law is split off from religion the triad of religion community and faith will be weakened. This amounts to saying that religion community and belief depend on the continuation of patriarchies or worse that group rights cannot but be based on a supersession of women's individual rights. In either case this is scarcely feminist. There is a third implicit rationale which is that while all other laws can be shared by different denominations and by believers and non-believer alike family laws must be singled out for religious legitimisation and can only be changed even on lines of gender justice if their religious legitimisation is not challenged. This third implication also has serious consequences for women: it is tantamount to saying that women in their family relations must both signify and be kept forcibly in an ideologically pre-capitalist and pre-contradictory realm never mind if the world is changing. Even

if women acquire further rights through reform of personal laws these rights must be seen to fall under the rule of religion be ratified by it and must not contradict it. And since all three rationales come into play *only* in the domain of family law, the conclusion is inescapable that the covert conflation is in fact one of women with religion and belief and community identity. That is women are uniquely required to be guarantors and preservers of a pre-capitalist enclave produced by modern political and economic procedures. This is so conservative a position, so rehearsed over 200 years and so obsessed with creating cultural spectacles geared to neo-colonialism and global consumption⁴⁴ that it does not even deserve to be entertained least of all from a feminist standpoint.

It is also possible to outline another slightly different conflation in which the legitimacy of personal laws is derived from identifying them with social plurality while social plurality hinges on a conflation of law religion and women's rights. Would the delinking of law from religion destroy cultural plurality and diversity of beliefs and religious practices? Surely it would only curtail sanctification of patriarchies through religion and its further ratification by law. (Indeed it may partly *free* religions from the tyranny of legal definition.) It need not stop the practice of religion in non-patriarchal ways. Or is it that the introduction of the same rights for all women will destroy plurality that is is it that *unevenness* of rights makes for social plurality? This latter is both anti-modernist and anti-feminist. Or is it that the nominal existence of personal laws is crucial regardless of how much their content is altered through reform? But if that is the position of the upholders of social difference then surely there is a tokenist non-substantive particularism alone.

(10) PERSONAL LAWS AND HOMOGENISATION

A major sticking point in these positions is a fear of homogenisation. However the belief that personal laws express religious plurality and the expectation that they will continue to do so if reformed with a view to gender equality is borne out neither by the history of their formation nor by their contents.

The pluralism that personal laws supposedly represent is in fact premised on an enormous reduction while the very notion of religion which underlies personal laws is one formed through a process of homogenisation. The British homogenised personal laws through codification and further codified custom through the accumulation of case law, scarcely incorporating the enormous diversity or variations of belief sect and practice in different regions and classes that existed even within the rubric of the major denominations. Subsequent reforms of

personal law have shown no respect for or commitment to this substantial diversity. In fact the reformed Hindu law and the Shariat Application Act helped to create newly unified versions of Hindu and Muslim. This did not happen by default: the reformers of personal laws first directly confronted then sought to erase the diversity of customs in order to homogenise the various Hindu and Muslim communities' across the subcontinent. Even now, reform of personal laws from within 'without or above is likely to continue this process and intensify the conception of sharply defined, bounded and exclusive religions on which such laws are based. And what is worse, it resembles a specific logic of communalisation on which much of the present politics of electoral blocs rests.

The reforms of Hindu and Muslim personal laws so far have produced two different models of homogenisation though both are in part facets or extensions of a common history of 19th century reformism. The colonial regime had already introduced a degree of Anglicisation privileging textual over customary law in what have been called processes of Islamicisation and Brahminisation,⁴⁵ and it had codified customary law in piecemeal ways. As the realm of common statutory law expanded creating the still extant division between the public and the private the personal laws governing the private domain came to be labelled religious laws, though they were either actually state enactments or the contents of their rules had substantively changed. Subsequent reforms of these personal laws⁴⁶ made similar attempts to homogenise the variety of regional customary laws, though only with partial success.

The reform of Hindu personal law after independence displays certain notable characteristics. Firstly, the state veered between secular and religious legitimisation. The first proposals for the reform of Hindu law used a religious basis but the final proposals (e.g. for divorce) could not be traced to religious texts and the claim of pandits to be legislators was disallowed at the same time some rules were allowed to continue because they were religious, even though they contravened Constitutional principles of gender equality.⁴⁷ Consequently the Hindu Code Bill was both Hinduising and de-Hinduising in an arbitrary way it made the law both less and more religious.

Secondly, it produced a tendentious legal description of a 'Hindu'. It purposively included the Buddhist Jain and Sikh despite protests. The plea of Sikhs and some Buddhists to be governed by their own laws was rejected. So too was that of Jains on the ground that their few differences from Hinduism were not fundamental! It further included anyone who was *not* a Muslim, Christian Parsi or Jew and it also mentions

that this code would apply to any Hindu, Buddhist, Jain or Sikh who has merely deviated from the orthodox practices of his religion but has not embraced the Muslim, Christian, Zoroastrian or Jewish religion. Next, it was extended to cover even those who did not profess Hinduism and were not active followers. Finally, it was reluctant to make or continue regional exemptions.

The bill thus attacked most principles of religious plurality and choice: it first recognised the existence and claims of in-between and unclassifiable areas (discrete belief systems, overlapping religions, non-believers, regional specificity) and then proceeded to deny them any legal provenance. The negative description of a Hindu as one who is not a member of the four excluded religions produced a Hindu so tightly minicked to his/her birth that even non-belief could not provide an exit. Even though the Constitution provided for the right of non-belief and atheism,¹ the reformed Hindu law took away the *freedom of legal self-definition and self-designation* from individuals born in Hindu families. Thus despite its crass assimilationism, it instituted a new primordialism: even as it described more people as Hindu than had ever been done before and included people who had no stake in being so defined, it made a new boundary. And what was worse, this description of Hinduism solely in relation to four excluded religions meant that these religions inevitably became its legal others. This could be partly related to the punitive laws on conversion discussed earlier: once non-belief had been de-recognised as a mode of exit from personal law, it remained only to try and seal the remaining possibility of exit through conversion. Since the legal definition of Hinduism had been artificially so enlarged, presumably all that a Hindu could now convert to was to the four excluded religions. Thus even the social meanings of conversion were narrowed, since much mobility that would have amounted to conversion in the past would now look like movement *within* the spacious ambit of this Hinduism. With the Hindu Mahasabha's shuddhi campaigns from the 1920s and the accompanying fear they whipped up about Hindus converting to Islam, conversion had become a volatile issue entangled in communal violence and remained so in the aftermath of partition. Though the attack on religious fluidity also had other antecedents in the colonial period which had made Christianity and Islam the main opponents of Hinduism, and even this negative definition of Hinduism can be seen taking shape in the 1891 Census,² the state now virtually handed a completed agenda to the Hindu communalists. Ironically, all this was subsequently defended in the name of Hinduism being at once a culture and a cultural synthesis.

When the reform proposals were discussed in the Lok Sabha it was claimed that Hinduism was not a religion but a culture, a synthesis of the varied beliefs, customs and practices of different people.³ The Hindu as legal entity became difficult to distinguish from the one desired by the Hindu Mahasabha.⁴

Thirdly, the crass homogenisation of diverse schools of Hindu law premised in a northern upper-caste model,⁵ at one level attempted to create a homogenised Hindu patriarchy through forms of levelled women who had more rights in some areas of inheritance were now to make do with less under the Hindu Code Bill. It preserved and unified unscriptural law derived from the Mitakshara that is prejudicial for women. However, there was no uniformity in some clauses (such as inheritance or adoption) while some unexplained exceptions were made with the result that many customs and practices of Hindu laws continued to operate.

Finally, the uneasy and inconsistent break from an upper-caste shastric origins in the model made it difficult for the Hindu Code Bill to either fully absorb lower-caste and class practices into homogeneous laws or to consider them separately. These were carelessly overridden,⁶ with the exception of customary divorces which were saved since 80 per cent of lower-caste Hindus already followed various customs of divorce. The Bill tried to act as an agent of uniformisation at certain levels of different castes, a patriarchal but with uneven results. Ironically, attempting to iron out the inconsistencies and erasing diversity in Hindu law may amount to another round of homogenisation, the Hindu.

The reform of the 1930s homogenised Muslim personal law on somewhat different lines: it involved no onslaught on customary law and customary variations as well as on the way customary law constituted contiguous syncretic collectivities that were not Muslim communities. It introduced legal homogeneity among Muslims as a basis for common religious identity, entrenched religious elites and achieved a predominance of scriptural law *through legislation*. Many of these features make the homogenisation of personal law appear to be a facet of those 19th-century reformist movements that had set out to Islamise by purging syncretism. Like the reforms of Hindu law, it had also set out to fasten Muslims to their personal law.

Till the 1937 codification of the Shariat Application Act, Muslims had followed Islamic law in certain matters and customary usage in others while regional laws and usages had been continuously engrafted as customs.⁷ Haryana Muslim landowners preferred customary law (more consonant with class and patriarchal interest) over and above the shariat law. The objectives of

this bill were legal reform, securing uniformity among Muslims in all their social and personal relations, to thereby do justice to the claims of women for inheriting family property who under customary law are debarr'd from succeeding to the same".⁸ More specifically, it was initiated by the ulama to bring Muslims of Punjab, North West Frontier and Central Provinces, to a uniform custom, i.e. law under a central personal law that would apply to all Muslims in the country. The Act improved women's property rights but by representing the customary domain as one of corruption and deprivation alone and its own task as that of rectification, Muslim women governed by a range of customary law now came under a more textual regime. The ulama wanted to establish the principle that Muslim personal law and not custom should be applied to Muslims. The bill attacked local customs and usages as too amenable to local or surecast interests and definitiveness in laws by divesting them of all custom and usages as well as of evidence of Muslims to their own laws. A compromise with Hindu who wanted an option between the shariat and customary law, benefiting property rights of traders and landholders, options were allowed for adoption, wills and divorces.

This process of homogenisation continued with the passing of the Dissolution of Muslim Marriage Act 1939. This was an amalgam of liberal features from four schools of jurisprudence, a Muslim woman limited right to seek divorce.⁹ The 1937 Act ticked the discrepancy between women's shariat rights to property and customary practice in such a way that attacking custom became a means for homogenisation. The 1939 Act using the same rhetoric of restoration made a notable departure from classical Islamic law in ruling that apostasy of women would no longer be a ground for dissolution of marriage. Where as it could have been a provocation to encourage intra-religious marriages, tolerance and individual choice, the fact that it was restricted to women (male apostasy remained a ground for dissolution of marriage) gave it different ideological location. It curtailed the opportunity for women to get out of a difficult marriage by apostasy and was initiated by the ulama upon discovery that a number of Muslim women were renouncing Islam or claiming conversion to qualify for divorce under Hanafi law and their fear that women would continue to do so. Women could simply have been granted better rights to divorce, while providing judicial priority to either not using or employing discretion in the application of a personal law or cases of the conversion of married women seeking to dissolve the marriage could have continued. Muslim fears of shuddhi and of the abolition and

conversion of women may have played a role alongside the notion of women as 'community' property. If the 1937 Act asserted the rule of personal law over a singular Muslim community the 1939 Act asserted the rule of personal law and community over Muslim women, but in doing so it reversed the methods of the earlier Act: now men were more fully governed by classical Islamic law than women. Boundaries were tightened to keep women in. Conversion would not affect the marital status of a woman but nor could it any longer free her from conjugal bonds or from her husband's personal law.

Significantly, conversion functioned as a customary loophole for seeking divorce not only for Muslim but also Hindu, Christian and Parsi women. In some cases where the courts declared their marriages not dissolved by conversion, the reasoning seems patriarchal.⁷⁶ For instance in *Robasa Khanum* a Parsi woman converted to Islam claimed her marriage was dissolved, the judgment praised the exemplary modernity of the 1939 Act, interpreted her action as a unilateral repudiation of marriage and upheld the sanctity of the Zoroastrian vow.⁷⁷ Male unilateral divorce both legally and extra-judicially was a norm, but women moving from one religion to another to seek a divorce threatened *civisme*. Hindu, Muslim, Parsi, Christian, since it challenged religious boundaries, male proprietorship and patriarchal laws.

If patriarchies like violence have to be legitimated and on the same ground, as representing the whole community then community spokesmen have as much interest in suppressing difference as communalists, and as I have tried to show, the state itself has been invested in tendentious ways of suppressing difference. In this context, reform of personal law has been homogenising, whether it was carried out from within or without. Ironically all these reforms claimed to be working on behalf of improving the status of women.

The belief that reform of personal laws will at once uphold gender justice and guarantee social diversity⁷⁸ is groundless. Indeed reform of personal laws from within or above is, in our context, itself an issue of the reduction of diversity, the suppression of cultural differences and the negation of space for choosing, changing or disavowing religions. Personal laws have been a principle of homogenisation on religious lines, from the colonial to the contemporary period; they have selectively and arbitrarily universalised high textuality, regional or upper caste practices and reformulated patriarchies both in their initial codification and in successive reforms. Further they failed to sift the customary domain and incorporate its more egalitarian aspects, oscillated between bourgeois patriarchy and non-interference in 'native' religions or

capitulated to upper caste/class patriarchal interests.

My further questions is – how much of the 'religious character' and 'diversity' of personal laws will remain after a further reform on the lines of gender justice? Even if we were to differentiate our feminist perspective and our sensitivity to social plurality from these earlier attempts, would reform of personal laws from the point of view of gender justice be less homogenising? Gender justice can only push all the different personal laws into a *similar* direction since there are not at the moment an infinite number of ways to bring it about.

The question then needs to be posed not as one of homogenisation per se but of its nature, principles and limits. New common laws for women would also be homogenising; however, while personal laws sought to unify denominational groups such laws would seek common rights on a non-religious, egalitarian and emancipatory principle. I will return to this but let me say here that fully developed precedents for an unoppressive form of homogenisation, based in an intelligent relation with social diversity, that adds to existing legal and customary rights and eliminates existing legal and customary disabilities, are unlikely to be found in colonial India or in contemporary laws.

III Cultural Diversity

(11) AN IDEOLOGY OF CULTURAL DIVERSITY

The issue of cultural diversity has two drastically different locations. One is an ideology of cultural diversity and the other is a renewed reckoning with the diversity of existing social practices in order to formulate laws that are not unilaterally destructive of all forms of diversity.

As my earlier discussion indicates, the ideology of cultural diversity rests on the assumption of discrete homogeneous communities each governed by its own tidy, primordial, determined package of legislation. They are deprived of internal diversity, looseness, and open boundaries, as well as assumed to cohere along lines of religious identity. Religion is the singular determinant and that too a religion not subject to regional or class variations. Ironically, it is precisely this ideology that also informed the processes of homogenisation through personal laws.

I will argue that existing diversity challenges the very principle according to which cultural diversity is presently defined as the property of pre-formed, sealed religious communities, transgenerationally outside the ambit of change and choice and on the basis of which community rights are defended/recommended. And further, I will argue that if we do reckon with the diversity of existing social practices then

the very principle of social plurality would have to include the 'rights' to change, make, break, segment and re-form 'communities' – without these it would be merely a principle of fixation, not a principle of plurality.

In the Indian context, those features attributed to cultural diversity that become distinctly ideological can be enumerated. First, the spatial coexistence of many sharply defined, sealed religions, ordained by birth, never chosen or changed, each the separate possessor of its own tenets, own way of life and own culture – virtually a proprietorial notion of separate ownership. The privileging of religions defined along potentially hegemonic lines suppresses all other axes of cultural diversity and ironically suppresses the diversity within religions themselves. Second, these multiple religions become the main opposition that India offers to western modernity, rationalism and the language of rights. Third, the maintenance of cultural diversity rests on maintaining or procuring community rights – which in practice boil down to personal laws – and opposing a homogenising uniform civil code, an opposition that is maintained without questioning the underlying categorisation of public and private or the homogenisation sought by personal laws. Fourth, the definition of community itself rests on a conflation of religion and culture, and more seriously, of both with patriarchy, running the danger of turning the defence of cultural diversity into a defence of diverse patriarchies.

Several persons have equated personal laws with plurality while elements of this definition can be found in many places, the concluding proposals of a recent essay by Partha Chatterjee brings them together and carries them to a logical conclusion by recommending self-governing minorities, defined as religious groups, whose cultural right needs to be defended.⁷⁹ In a somewhat rhetorical confrontation of 'them' and 'us', our cultural diversity, community rights and non-western post-colonial modernity make up one bundle weighed against their 'unitary rationalism of the language of rights', individual rights and western modernity. He believes that 'cultural diversity and the right of people to follow their own culture' which a secular/democratic state must protect is a

demand [that] cannot be easily squared with the homogenising secular desire for let us say a uniform civil code: the respect for cultural diversity and different ways of life finds it impossible to articulate itself in the unitary rationalism of the language of rights. There is no viable way out of this problem within the given contours of liberal democratic theory which must define the relation between the relatively autonomous domains of state and civil society in terms always of individual rights. As has been noticed for many other aspects of the

emerging forms of non-western modernity, this is one more instance where the supposedly universal forms of the modern state turn out to be inadequate for the postcolonial world [my emphases]⁸²

The notion of diversity implied in his essay seems to be one of a finalist cultural differentialism in which India is a spatial agglomerate of separately owned, solipsistic cultures – Muslim, Hindu, Sikh.⁸³ The threat to this cultural diversity would seem to arise not so much from pressures of the market but from political mobilisation, on the basis of a unitary language of rights, against inequality and gender discrimination.

Since the content of religion as an operative category, and the history of 'community' legislation and its effects on women remain unexamined, (the question of women is not directly raised), while minority cultural rights seem to be, by and large, confined to the right to personal laws, a conflation of religion, 'culture' and patriarchy results. Further, the idea of difference seems to be based on an active deferral or denial of commonality – in this case the privilege of having a basic quantum of shared, individual democratic rights, citizenship for women and an accountable state. A diffuse, over-encompassing notion of post-colonial, non-western modernity combines with the inadequacies of enlightenment rationality to tacitly preclude 'non-western' women from any other horizon of self-definition but their 'own' culture. This is rather daunting since it is on women that personal laws press the most heavily. As Sabina Lovibond has eloquently analysed, dismantling the as-yet-incomplete project of modernity for egalitarian, feminist social movements runs the danger of political quietism, parochialism and anti-feminism.⁸⁴

In Chatterjee's essay we have the added paradox of a self-consciously pluralist, anti-essentialist, anti-enlightenment postmodern position, that is led by its very over-investment in excoriating the enlightenment as responsible for all the sins of the Indian polity, to propagate a version of cultural diversity that is based on an essentialist, bureaucratic description of religious community, premised on fixity: this description of religious community is a product of the artifice of the colonial regime, formed in the exploitative relations of colonisation, marked by the settlements, compromises and patriarchal assertions of both emerging and ruling classes, and crystallised through community claims predicated on a series of 'unifications'. While religious communities are pitted against the essentialising procedures of the enlightenment, they are never themselves interrogated as bearers of a host of essentialisms. Further, this definition of religious communities as 'sealed', has in the Indian context been shared by the Hindu,

Muslim and Sikh communalists, indigenists, as well as liberal theorists trying to accommodate community rights.

The idea of cultural diversity becomes largely ideological whenever any exercise of the right to assimilate ideas of rights, justice, equality, and citizenship by non-western moderns is challenged *per se*, regardless of its political affiliations, aspirations and social effects, on the sole ground that the ideas originated in the 'west', since (in nearly tautological fashion) these ideas destroy cultural diversity. Cultural diversity in India (and some of its definitions) are themselves partially a product of colonisation, but in this ideology, cultural diversity begins to carry an undercurrent of 'authenticity' through the prohibition on the appropriation of anything 'western'. Is cultural diversity then to be based on the stasis of perpetual othering? Or (in Kwame Anthony Appiah's phrase), on the 'manufacture of alterity'?

Thus the first question in an argument for cultural diversity sensitive to gender justice would be – in which social terrains is diversity being privileged? With some regional variation, substantial areas of social life have been 'legally' homogenised by the state. Since ownership of agricultural land, crime, commerce, tenancy, international relations are 'public' domains, they are either presumed to be homogeneous or to require homogenisation. The onus of maintaining cultural diversity rests on 'personal' or 'family' laws while the very principle of cultural diversity so defined is based on an insidious and discredited division of public and private. Is there a hidden patriarchal agenda, that is, are old prejudices simply being rebottled in new academic languages? Is the 'personal' a male sanctum, and are familial patriarchies the privileged site of cultural diversity?

Another favoured terrain of diversity is rights and this has alarming implications for women. Is the institution of common rights for women an agency of homogenisation and deculturation? And is depriving women of uniform rights a way of preserving cultural diversity? The doubts about a proliferation of the language of rights can imply a return to premodern and customary languages of 'entitlement' and 'obligation' which were embedded in patriarchal arrangements.

In which situation is such a diversity being privileged by a section of the intelligentsia? Are they opposing capitalism, the relations of exploitation that underlie it and the culturally homogenising imperatives of multinational capital or merely displacing their unease and confining their protest to the cultural effects of capitalism? Is an argument for a diversity of personal laws based on sealed denominational communities simply a new addition to the range of anti-modernity

positions that have accompanied capitalism, overdetermined by notions of pluralism that have been introduced and debated in cultural contexts very different from the Indian? And is this particular form of pluralism resistant or hospitable to multinational capitalism and its redivisions of labour and capital?

And can we have the one sort without the other, that is, global capitalism without individual rights? Can women function under capitalism (which exploits individual labour) unprotected by commensurate rights between individuals and rights protected by the state? The limited rights available under personal laws are not commensurate with present needs. We also need to differentiate between forms and agencies of homogenisation and heterogeneity associated with capitalism – market, media, technology – from those associated with religion and law. Surely we can question the historical terms in which the abstract idea of universal rights, as derived from a purportedly ungendered or de-gendered rationality, were initially expounded, without giving up the concept of rights *per se*: the validity or invalidity of these concepts would then emerge from an intelligent exchange between the material and necessarily different situations of women on the one hand, and on the other, the promise of rights made initially in the name of abstractions. That is, between abstract and concrete rights, with the understanding that any concretisation of a universal principle must be contextual. This cannot emerge from a prescription of anti-modernity for the 'third world'.

(12) IDEOLOGY OF DIVERSITY AND A UNIFORM CODE

The ideology of cultural diversity makes its appearance not merely in defence of personal laws but also in defence of uniform laws. Most especially in the reiterated suggestion from liberals of making a uniform civil code that derives from the best of all religions. Any serious appraisal of religions, their relation to patriarchies, is alien to the theoretical horizon of these positions, however good their intentions may be towards women. The uniform civil code is expected or assumed to occupy the *same* area – personal, religious, gendered – as is currently occupied by the personal laws.

A recent essay by S N Roy exemplifies the way certain types of demand for a uniform civil code can simply rehearse the same ideological assumptions about religion, community and cultural diversity, as most arguments for personal law. He describes the uniform civil code as a minimum common basis for inter-communal harmony with the capacity to reduce present hostility. He considers 19th century reforms to have been reforms from 'within' carried out by 'Hindus', and upholds

them uncritically as a model for Muslims now, even castigating their failure to reform from within in a similar fashion. Reform from within, he says, will take away the BJP's tool for communal hostility. In case reforms from within cannot take place, he argues, then 'secular' elements from all religions should arrive at a 'consensus' for a uniform civil code, so that it is not imposed on any one. In the process, the basic tenets of religion should not be harmed; only the misusable elements (such as talaq and polygamy) can be taken out.⁸⁵

In a remarkably uncritical and voluntarist view, 19th century reforms are recast as religious reform from 'within' effected by a fully formed 'community' and the onus is now put on Muslims, while the projected uniform civil code becomes a device for inter-'community' conflict arbitration. Such a uniform civil code will not be less religious than personal laws – it will be a compound of the benevolent aspects of all religions; no critique of religion seems to be required. Nor will it be different – it will only be a selection, on the principle of omission, from existing personal laws. Nor will it be based on an analysis of patriarchies – the laws may be for women but in practice they are a matter of religion-based arbitration by secular elements of religious communities. Nor indeed will it be secular – it will seek legitimisation from secular elements whose own authenticity rests in belonging to a 'community'. This is a version of the uniform civil code that resolves the question of personal law by sorting the wheat of religions from their chaff, by being a more transcendent religious law, 'personal' to all rather than one religious group. It rests on the same communitarian and gender-blind premises that I have discussed earlier.

It may help to move from questions of community, and, in the light of its cross cutting constitution, follow two other questions – a fresh definition of cultural diversity and the extent to which it depends on legal pluralism – before discussing how much diversity the laws can address in relation to rights for women

(13) CULTURAL DIVERSITY: FROM ANOTHER STANDPOINT

In my view, a reckoning with social heterogeneity would have a standpoint radically different from that of the ideology of cultural diversity. This involves articulating diversity as an historical explanation and disentangling different types of plurality – religious, legal, customary as well as those which result from the systemic inequalities of castes and patriarchies – in order to formulate an alternative politics based on evaluation. The ideology of cultural diversity is committed to a stance of anti-modernity and resists evaluation of anything 'non-modern.' Whereas the

nature of existing cultural diversity necessarily entails evaluation to distinguish between strength and hazard as well as between cultural diversity and social disparity. Further, accepting this ideology of cultural diversity based on discrete religious communities may involve simply opting for different patriarchal arrangements

The history of social plurality in India has to be disentangled from concepts of ethnicity and multiculturalism in their liberal and postmodernist registers. The segregationist differentialism carried in the liberal ideas of the ethnic and 'multicultural' not only implies many cultures residing together with a boundary distinguishing one culture from another,⁸⁶ but does not square either with precolonial social formations or with the type of colonisation India underwent.⁸⁷ Postmodernist pluralism privileges a kaleidoscopic hypermobility, bricolage, and spatial concurrence over those processes of material structuration which determine the nature, priority and relationships between cultural differences: since national boundaries are perceived as a major antagonist of pluralism, its politics rests on the autonomy of little identities and decentred networks that can enter into global intra-communal alliances.⁸⁸ Theoretical difficulties aside, I do not see how the question of rights for women can be posed from within a claim to infinite pluralisation or from outside the parameters of the nation-state. Further, the structured cultural networks that obtain here makes both integrating or balkanising attempts equally wilful and artificial.⁸⁹

(14) RELIGIOUS PLURALISM AND CULTURAL DIVERSITY

As far as religions are concerned, religious plurality is not a product of the mere existence of many religions – *of being more than one* – but of the nature and quality of their substantive social interactions, the field of overlaps and choices and the determinate historical repertoires so created. Diversity would also partly be that historical principle and process which has in precolonial, colonial and contemporary India continued to challenge discrete religions and their boundaries. It would be concerned with medieval (and later) traditions of comparativism, the richness and complexity of historical fashioning, the contexts in which religions were shaped, lived out, contested or became hegemonic, as well as with the significance of conversions in shaping a multi-religious formation. It would investigate how far 'cultures' in India are and are *not* separately owned or separately made, and make distinctions between the composite and the syncretic. It would be concerned with the nature and location (in terms of class and region) of syncretic spreads, and would see

both the purging of syncretisms, the reassertions of fluidity and renewed avenues of multiple choice as a continuing process. The ideology of cultural diversity based on given religious communities with impermeable boundaries, assumes that the purging of syncretism is *completed* and irrevocable. It represses recognition of those diversities that can still be a cultural strength and ignores contemporary evidence of religious fluidity. There is a vast gulf between the theological systems and ideological purity of dominant religions and everyday religious practices of ordinary people that mix concepts, rituals, symbols from different systems.⁹⁰ Popular religions exist at the intersection of many denominations, may implicitly call them into question and are now produced as much through urbanisation and urban subcultures as they were in the past by local agrarian subsets of superstition and belief.

The alternative standpoint I propose would, however, reject religion as the singular determinant of cultural diversity. Just as religion is not the sole type of primordialism, and primordial community is not the only available form of social collectivity, so religion is not the *singular* axis of cultural diversity. One major reason for this is because cultural diversity is an effect of multiple primordialities⁹¹ in dynamic relation with class and other non-primordial collectivities. I would also reject as unhistorical the perception of religion as an undifferentiated axis of cultural diversity.

The inflation of religion as the singular axis of cultural diversity involves collapsing politically articulated difference with social plurality *per se*. The actual cultural diversity in the country exists in a politically unarticulated and politically unselfconscious realm. And it is this rather than four personal laws, a product of political articulation by the state and community spokesmen, that constitutes genuine plurality. It would be a sorry state of affairs indeed if plurality could only be preserved now through the artifices of contemporary 'Hinduism' or 'Islam'. Ironically, 'deen' and 'dharma' have crystallised as realms of political difference, while social commonality is taken for granted since it never obtrudes on the political arena of communal conflict save as tolerance or human decency. In fact the unselfconscious and inarticulate character of commonality leads to the assumption that it has no history and is not accompanied by historical memory – historical memory becomes the monopoly of only those who claim antiquity, loss, decline and seek rejuvenation.

Finally, regarding religion as the solitary axis of diversity has produced an extraordinary fetishisation, arising, as also in the case of religious community, from a narrow focus on the byproduct or endproduct without at the same time

analysing social processes. A democratic, sensitive social project cannot and should not be inimical to cultural differences or diversity; nor can it afford, however, to fetishise them. People, practices and institutions change as well as fossilise, and some changes may be actively desired or desirable. One possibility is to see cultural diversity as the *end product* of short and long historical processes, rather than as *direct* object of annihilation or preservation. A 'mobile' cultural diversity *cannot* be the direct object of preservation, *rules* cannot be prescribed for maintaining in-between spaces. The major question as I see it, is not about religious pluralism or cultural diversity *per se* but about the social processes that have produced these phenomena in the past and can sustain them now under capitalism. We can only support those *social processes* which permit more religious fluidity over and above those others which do not.

(15) RELIGIOUS PLURALITY AND SYNCRETISM

If we discard the notions of sealed religions and religions as sole determinant of diversity, and theorise religious plurality as characterised as much by syncretising interactions or processes as by the making of discrete religions, how do we evaluate these syncretisms? Syncretism is neither free of ideologies, nor does it have a single or singular moral, political and cultural valence. Its meanings may conjuncturally alter.⁹²

Syncretism is a site which has been resistant to orthodox patriarchies. For instance, the in-between areas produced by syncretism, conversion, or atheism, have posed a continuous threat to the interrelated formation of religious orthodoxies, community claims and (usually upper caste/class) patriarchies. They have been most resistant to (and threatened by) clear-cut definitions, legal codification and homogenisation, and have provided a degree of fluidity and social choices. The categorisation of some laws as 'personal' has itself acted as a denominational pressure, enforcing unsought clarity of definitions and the tyranny of the denominational 'name' on those converts who have followed bits of different 'religious' laws or those for whom conversion was a form of rejection of religious or patriarchal oppression (some low caste groups or some women). Non-believers and atheists, men or women, are as threatening for present-day votaries of religious community as for orthodox believers. Their legal rights seldom enter the debate and are assumed to be covered by the Special Marriages Act! In such a context the (usually anti-modernist) characterisation of unbelief as 'western' becomes ironic – the refusal to be named can singly or together invoke premodern traditions of atheism, an enlightenment

secularism and/or resistance to the way denominational 'description' assists communalisation.

The definition of syncretism as 'influence', whether as benign or malign, can be distinctly ideological and needs to be discarded. Syncretism both resides in and is a product of a wide field of interaction. Commonalities resulting from coexistence cannot be reduced to influence, whereas a notion of two-way interaction has the advantage of speaking of structures and conjunctures, attending to the common contexts and mutual re-formations involved in cultural change. An influence-centred theory of interaction involves a passive relay and reception, a possibility for re-constituting ancestry/roots, a filiacentrism regarding originator of influence. Resting on a them-and-us on singular lines, it can lend itself to a reification of roots and projects of purification. Change is perceived as internal to religious traditions not a function of contexts. Each religion becomes a discrete, autonomous unit which squelches away little nuggets of 'influence' into its own hoard and discards them at will. This was one of the ideological premises of Sikhisation, Islamisation and Hindurisation – influence was something to be weeded out. Syncretism was defined in hard versions of Sikhism and Islam as 'reversion' to pre-conversion practices and in hard versions of Hinduism as the corruption wrought by the invasion of Islam and Christianity. Under the guise of erasing influence they tried to erase the social space of interaction with a cunning knowledge that prohibiting interaction may be the best way for wiping out syncretisms.

However, questions have to be raised about the specific structural locales and social agency of syncretism – that is, whether it is imposed or the product of coexistence and gradually accumulating choices, whether it aims to results in erasing other differences, the nature of the resistance or challenge posed by a specific interactive network to existing structures, whether it is implicated in class, caste, gender and nationality based discrimination. Syncretisms have to be conjuncturally evaluated according to their own selective procedures, functions, transactions, and teleologies. For instance in-between areas have also functioned as nodes of incorporation and assimilation and can be equivocal buffers from 'religious orthodoxy'. Syncretisms especially in the customary domain, may be the site where patriarchal consensualities operate: that is, an area of shared oppressions for women. Thus though syncretism is a corrective to ideologies of religious community, birth-bound identity and cultural diversity, it cannot be offered as a panacea since it has itself to be opened to an equally rigorous interrogation.

(16) DISPARITY AND DIVERSITY

Syncretism has never been articulated as a concrete coherent political position from which lessons of resistance can be learnt by feminists. Before it can be so articulated, syncretism and other forms of diversity have to be opened to even sharper questions of patriarchal ideologies and privilege by confronting the subtle conflation of and explicit refusal to make distinctions between social diversity and social inequalities.

Cultural diversity is formed in a complex play of power, resources, geography and political systems. Ideas of 'essential' difference have been a notorious basis for discrimination. Do 'differences' produced on the basis of class, caste, race or gender, the products of systemic inequality, now need to be preserved as indices of cultural diversity? Can plural practices resulting from the discriminations or exclusions of caste and gender usefully be called diversity, and if so is it a desirable diversity?

While we cannot afford to politically confuse cultural diversity with social disparity, we have to simultaneously recognise that in our history disparities have indeed produced specific forms of diversity. For instance, diversity can also be a product of the differential distribution of patriarchal oppressions/protections and customary rights/disabilities. This in fact can be an evaluative standpoint from where the question of *which* cultural differences are sought to be maintained can be addressed: that is, do they help women and substantively enlarge their choices or simply entrench diverse patriarchal arrangements. Unless cultural diversity is confronted with such questions it runs the danger of becoming a localised replay of the angst of colonial anthropologists or of the bad faiths of bourgeois anxiety vacillating between destroying and preserving its 'others'.

(17) RELIGIOUS PLURALISM, CUSTOM, PATRIARCHIES

Similar questions have to be addressed to the diversities in the customary domain. The customary domain is not reducible to personal laws (these are a compound of new statutes, derivations from customary law and a suppression of customary variation) and is far wider than religious plurality since it incorporates primordial and non-primordial forms of social organisation, and relates to most material aspects of life. The conflation of custom, religion and fixity, as by British administrators led by William Jones in the late-18th and early-19th century, is utterly misleading.

Customs display innumerable relations to textual religion or scriptural tenets ranging on a continuum from co-operation to antagonism. They may be formed in ignorance, in tacit contravention, or in rejection of religious texts, or through

exclusion by scriptural texts (as of low castes). They may be a way of resolving the needs of changing social formations against a fixed, static body of texts, or part of the gradual and relatively non-conflictual adaptation of religions to social change. They may take advantage of discrepancies in texts.⁹¹ They invent practices not covered in texts, authorise present needs or desires, and may defend obvious deviances on the ground of custom.

Customs thus are differential or varied embodiments of more or less univocal texts. What is more important, they show that religion is not and has seldom been the unalterable letter of the law. Custom is the battleground on which the full, embodied sociality of religious texts is established. To complicate matters further, many of these relations of custom to religion are replicated in the range of relations between custom and statutory laws whether personal or general.

In some situations, not all customs have united men and women across denominational lines, on rationales of region, class and/or syncreticism, but at others they have reinforced caste and religious divisions. Syncretic customs, including some of women's religious practices, take effect in a context of sociological norms and social tolerances.⁹² But custom is also a major field of patriarchal assertion in the form of class and caste differentiation – subject to both consensus and conflict. Upper caste customs can be guarded as privileges and lower groups not be allowed to practice them. Customs are equivocal about patriarchies – they may grant or deny entitlements to women, and as a form of local pressure can work both for and against women. Customs which challenge religious texts or commentaries or assist cross denominational social unities may be as patriarchal as those that conform to texts or maintain religious boundaries.

Thus if the customary domain is indeed the largest single determinant of cultural diversity, it is also the most difficult and necessary to evaluate for a secular feminist project. It may provide lessons in the way social processes challenge high textuality and throw up secular norms or non-religious law but it is far too ambivalent to be a source for laws.

(18) LEGAL PLURALISM

There are two existing types of legal pluralism, as established through the laws and functioning of the state, and as practised in the realm of non-state customary arbitration. Both have helped to sustain regional and religious diversity but as entwined with class, caste and gender inequality. If they have helped to maintain social plurality, they have given similar assistance to diverse patriarchies. However, there is no simple fit between legal pluralism and religious pluralism, and this could help

in thinking of the boundaries between law and religion historically, contextually and contingently.

Legal pluralism has a complex, tortuous history. Ancient Indian law was structured around demarcating different categories of persons on lines of caste, gender or denomination (atheists were a persistent 'other'). Thus one source of legal pluralism was the order of castes that determined claimable entitlements, obligations, privileges, as well as punishments and violations for each group on a descending scale. Consequently, no right was theoretically universalisable, and no crime was the same, that is, open to identical punishment. The *Smritis* further allowed for discrete, overlapping, intersecting patriarchal arrangements for different castes. The logic of northern conquests and expansion was another source of legal pluralism. For instance the *Manusmriti* enjoins leaving the customs of the conquered intact (opening both text and custom to conjunctural use). This logic brought into play a variety of practices ranging from non-interference to partial incorporation (as of tribal groups), and produced a long-standing tension between the customary and the textual.⁹³ New interpretations and commentaries as well as different schools of law, often tied to denominations, made for a theoretical pluralism, compounded by customary variations in regions and social groups. The inconsistency of texts as well as the leeway they gave to well-instructed brahmins to decide cases for which there were no general rules, both made for a structured looseness and a built-in heuristic space that was sought to be kept as the monopoly of brahmins. However, there probably existed a multiplicity of jural sites based in tribal organisation, caste division and localities alongside the powers vested with the monarch and in the state.⁹⁴

Some of these features can still be seen in the medieval period, though a common criminal law was introduced, sometimes with provisos of differential application on the basis of denomination (Akbar tried to minimise these), and new legal principles were also sectorally introduced. A new notion of contractual, alienable and claimable 'rights' was implied in *haq* and entered into different relations with earlier concepts of 'entitlement.' There is also evidence for the multiplicity of jural sites in a number of regions.⁹⁵

The colonial regime only effected piecemeal homogenisation; it introduced many legal changes but did not or could not end legal pluralism. The British discovery of, alliance with, and/or usurpation of local sources of power and authority dates back to the selective non-interference of the late-18th century, and was a source of legal heterogeneity. So too was the oscillation of the colonial state between

non-interference and the desire to selectively institute a version of bourgeois patriarchy. British policies involved attempts to homogenise certain laws, especially those governing land relations and crime, an extremely problematic codification of personal laws, a practical extension of the principle of denominational categorisation beyond Hindu and Muslim personal law, but effectively allowing for immense regional variation depending on which problem was being tackled where and in which political conjuncture.

Laws in the presidency areas differed, and often on patriarchal lines: in some places selected and reconstructed versions of Hindu upper caste laws were sought to be universalised – for instance the *Manusmriti*, was scarcely popular in the south; in other areas like Punjab customary laws were sanctioned.⁹⁶ Despite the fears of homogenisation it raised, the Special Marriages Act functioned as a form of legal pluralism making civil marriage available for the English educated, the 'secular', those who favoured choice of partner, and/or wished to make inter-caste marriages. Disputes between persons who were neither Hindu nor Muslim, in presidency areas, were arbitrated through the application of English law, or by applying existing custom or even the law of the country of origin.⁹⁷

The areas under indirect rule followed differing trajectories. Some princely states like Baroda and Indore instituted a civil marriage act before the presidency areas.⁹⁸ Others became patriarchal havens – for instance those which did not institute a minimum age of consent even when it was instituted in the presidency areas, provided avenues of selection. Both Hindus and Muslims crossed borders to obtain child marriages more beneficial to patriarchal arrangements – a 'diversity' that did not benefit women.

While the colonial state was divided or inconsistent, people often exercised choices, in matters relating to marriage and family, between non-British customary law and statutory British law depending on what seemed more appropriate, easily available and favourable. Customary law was not fully codified while personal laws had only partly homogenised the variety of regional and customary laws, and people often used a combination of personal and customary laws. The rule of personal law was far from absolute: laws for Christians, Muslims and Hindus varied according to domicile throughout the colonial period.⁹⁹ Further, different laws in different states under direct and indirect British rule alongside the continuation of non-state jural sites produced legal shopping. Simultaneously, most people were under the jurisdiction of caste-law which remained relatively independent of court-law and could be as inhibiting and nervous.¹⁰²

The present forms of legal pluralism also exist at both state and non-state sites, and some of these are simply continuations of earlier forms. The state enacts its own brand of legal pluralism through politically motivated, selective interference and non-interference in personal laws.¹⁰¹

At one level, the contradictions between Constitutional provisions for gender justice and fundamental rights and some of the statutory laws (both personal and general) have produced a multiplicity of competing interpretations, some of which are useful for feminists and some not. This is complicated by the contradiction in the Constitution itself, recognised by its architects, between the freedom of religious practice and reforms oriented to gender justice.

At a second level there is a plurality built into the laws through the variations in state laws¹⁰² through continuation of colonial laws, partial codification and internal inconsistencies,¹⁰³ as well as through available options and exemptions positing different principles and/or categories of persons. For instance, personal laws, exemptions for tribal women and for some bodies of customary law, a small pool of general laws, sections of the criminal code relevant to women, the Special Marriage Act and Indian Succession Act – all govern family relations but are not formed on identical principles. The distinction between religion-based and secular laws is not clear-cut. Some particularistic provisions from personal laws have seeped into non-religious laws. Other interrelationships between the two also exist or have been introduced.¹⁰⁴ The mutual contamination of religion-based and secular laws seems to function through connections, segregations and dispersal. Some areas like inheritance are governed piecemeal by personal and non-religious laws. Personal laws work in tandem with other statutory laws – neither domain is autonomous – while there are some routes of access from a personal law to some secular laws.¹⁰⁵ (This is not to speak of an unintended plurality arising from the unhomogenised, labyrinthine, and unrationalised aspects of the law as a whole.)

In some cases, combinations of customary and personal law are still available, while in some other cases customary laws alone are practised. Customs are legally established and become efficacious through precedent and case law, they can in theory overrule statutory law but in practice this tends to be arbitrary. Statutory law does recognise certain customary areas if precedent can be proved and if no statute has previously cut across or overridden it.¹⁰⁶

Custom is the interface between law and practice¹⁰⁷ and was given different recognitions in different legal systems – for instance brahminical, mughal and colonial. Customary variations are not subjected to

any single convincing rationalisation. At present one aspect of custom exists in active relation to statutory law, seeking either exemption or inclusion. However, there is a vast domain of customary and juridical practice and extra-legal jural sites that is either tacitly propped up by statutory laws or demarcated (and so restructured) by being left out, or unsanctioned by statutory law and court procedures bearing no direct relation to them – or even has a relative autonomy from them. It is implemented by customary arbitration, caste councils, caste and village panchayats as well as village elite. Here the faces of practised patriarchies are visible whether in widow immolation, punishments for intercaste marriage or 'community' virginity tests.¹⁰⁸ These forms of customary arbitration, with their independent roster of customs, laws and 'crimes,' personal to local groups, can be more punitive than law courts. And with no recourse. Indeed their greater flexibility and efficient implementation, can for the same reasons lead to greater oppression and become a feature of local patriarchal coercion. Patriarchal customary practice enforced by the punitive capacity of local yet powerful consensuaries – the frequent coincidence of jural 'communities' with the holders of economic, social or cultural power (for example village elites), effects all sections of the oppressed including women.

In many cases such jural groups have been coming into conflict with the new legal system – often local institutions and the daily power of village elites are at stake. But these conflicts are not of a single type. Therefore in each case feminists have to ask the question of whether the shift from customary to statutory enhances or reduces the agency and the rights of women. The question is one of extraordinary complexity since local customs are imbricated in the local economy of types of agricultural production, division of labour and labour requirements, ecology, nature of commerce, caste divisions, distribution of land and the market for land, as well as related to and responsive to changing economies, the pressures of the market, the law itself and to caste and class mobility.

The centralising laws of the colonial and contemporary state have thus co-existed with a number of uncentralised, operative jural sites, jurisdictions, juridical and arbitration processes. (Indeed some centralising laws were, in theory, consciously instituted *against* these multiple jurisdictions.) While the presence of these jurisdictions does imply levels of non-intrusion in civil society on the part of the state, it does not imply any commitment to social pluralism. In ancient India, legal pluralism was partly an *effect* of state expansion accompanied by selective non-interference in the customs of conquered peoples, displaying a tacit investment in

social hierarchies. With both the colonial and contemporary state, legal pluralism and jural multiplicity continue to imply varieties of pragmatism, while with the contemporary state they further imply a reneging on the promise of democratisation. This is so because prior to 1947 no state had been even theoretically committed to social and gender equality.

However, in part legal pluralism has also been an effect of the continuing implication of civil society itself in inequality and patriarchies. The range of choices that extra-judicial systems provide has never been accompanied by the institution of equality, nor are these necessarily *enabling* for women.

We can idealise neither existing statutory nor customary laws. The patriarchies enforced in non-state jural sites have to be resisted as much as those of the state and its laws. Given this equivocal character of legal pluralism, whether statutory or extra-statutory, a feminist legal project would need to keep in mind the difficulties of squaring legal reform with the ground realities of extra-judicial pluralism, given the small number of women who take recourse to the legal systems compared to those governed by the extra-judicial domain. Further, if until now neither legal homogeneity nor heterogeneity *per se* have been a guarantee of justice for women or the removal of patriarchy, then the question of legal inequality has to be addressed to both the state and civil society and its customary practices. Even supporters of reformed personal laws or of a uniform civil code cannot escape this question.

The question of rights for women then cannot be reconciled or even posed within religious pluralism, within existing types of statutory and extra-statutory legal pluralism or within existing forms of legal homogenisation. The crucial question of the most enabling forms of homogeneity and diversity can be approached only through a discussion of multiple patriarchies.

(To be Concluded)

[Author's Note: This essay began in Kanpur at a workshop of women activists in March 1993. Presentations based on different sections were given at a seminar on fundamentalism in Melbourne (October 1994, Kasauli, March 1995 (seminar on Governance in Multicultural Societies), Slovenia, May 1995 (conference on The Nation and its Others), School of Oriental and African Studies, May 1995, and a public meeting on the Uniform Civil Code organised by Saheli in Delhi, August 1995. I am deeply grateful to Anwar Ahmed, Gautam Navlakha, Amit Gupta and Swati Joshi for their comments. The responsibility for the views expressed, however, is entirely mine.]

Notes

1 In framing the demand for a uniform civil code as an implementation of a directive principle in the Constitution the BJP seeks not only to prove its own legalism but to present itself as fulfilling the promise of independence both in its ideals and in its legitimacy. In doing so it is pretending to forget its own illegality and denigration of the Constitution during the destruction of the Babri Masjid. Further in order to propagate the uniform civil code it is now quoting chapter and verse from the same Nehruvian secularists who are otherwise its special targets such as Ambedkar, Munshi and Masani (Madan Lal Khurana, *The Times of India*, August 12, 1995). This exercise is intended to blur their own ideological affiliation to the Hindu Mahasabha that had opposed reforms of Hindu law. It is also intended to disguise the fact that their propagation of a uniform civil code has the same rationale as the destruction of Babri Masjid—that is revenge by self-designated victims of a historical injustice, now the uniform civil code is to be a revenge by victims of a partially reformed Hindu law that took away some male privileges. At present the BJP is staking its claim for one nation and one code on the equality and dignity of womanhood. Their uniform civil code would be the amalgamation of the best from each community, the best from various codes would be culled and incorporated while the bad and outdated would be deleted (retired judge Gumanlal Lodha, *The Times of India*, August 3, 1995; Sushma Swaraj, *Indian Express*, July 31, 1995). Advani promises that a uniform civil code will strengthen the secular fabric and deliver gender justice (*Hindu*, July 18, 1995) and some spokespersons are presenting themselves as above religious division. They claim that the uniform civil code will not be an imposition of Hindu personal laws on minorities; it would also do away with the evils afflicting the Hindu society (*Indian Express*, August 2, 1995) for instance the discrimination against Hindu women in matters of custody and inheritance (*Hindu*, July 21, 1995) while some take protective positions vis-à-vis minority women. Description of wives with pitiful alimony is common among Christians and Hindus in Meherbaya according to Sushma Swaraj. However, their anti-Muslim bias leaks out in a number of ways. First in showing up the backwardness of Indian Muslims by pointing out that Islam is capable of reform and has been reformed in other countries (D. K. Jain, *Indian Express*, August 2, 1995) without acknowledging how their own aggression retards reform and change by putting minorities on the defensive and silencing minority women. Second, in pointing at the exemplary nature of the Hindu personal law's accommodation to change (Sushma Swaraj says if the Hindu civil code could be evolved why not those of other groups) and thirdly in localising polygamy as a 'Muslim issue' (V. H. Dalmia, VHP president, *The Times of India*, August 3, 1995) partly by focusing on the handful of Hindu men who converted to Islam in order to marry again and forgetting the innumerable Hindu men who commit bigamy without bothering to convert.

Further their political strategy in which the women's wing of Mahila Morcha will whip up gender justice through a uniform civil code makes it clear that the emphasis on gender justice is a form of moderate Hinduva (*Hindu*, July 18, 1995). This is borne out too by its wariness in concretising either the content of the proposed code (the uniform civil code will be drafted by constituting a law commission [Sushma Swaraj, *ibid*]) or even of the proposed anti polygamy law for BJP ruled states which has remained a controversial issue in inner party debates (*Statesman*, July 24, 1995). Vajpayee felt that even drafting the anti polygamy law was best left to the centre (*Indian Express*, July 23, 1995).

2 For some of these complex logics of pre-modern and 19th century corporate jati mobility see Hitesranjan Sanyal, *Social Mobility in Bengal* (Calcutta: Papyrus, 1981), pp. 47, 44, 48, 49.

3 For a discussion of this process in the Hindustani belt in the 1870s see Kumkum Sangari, 'Differentiating between Hindu and Muslim Women on Domestic Sines presented at seminar on Appropriating Gender: Women's Activism and the Politicisation of Religion in South Asia', Bellagio, August 1994.

4 The fact that religious reformation was at the time understood as a politically efficient compound of class, caste and community claims is well illustrated by the massive conversion of the Punjab church to Islam, Sikhism, Christianity as well as the Arya Samaj. For an account of these as well as other lower caste conversions to these religions see Duncan B. Forrester, *Caste and Christianity: Attitudes and Policies on Caste of Anglo-Saxon Protestant Missions in India* (London: Curzon Press, 1980), pp. 73, 81, 2, 87, 88.

5 As Lucy Carroll has pointed out, those seeking patronage or protesting proscription had to speak in the name of a bureaucratically recognised category (Colonial Perceptions of Indian Society and the Emergence of Caste Associations, *Journal of Asian Studies*, 37 (1978), p. 249).

6 Forms of Hinduisation emerged in the 18th century as shifting pragmatic modes of legitimisation accompanied by enlarging avenues of mobility and the growth of an intermediary strata following the parcellisation of the Mughal empire. On this latter see Burton Stein, 'Toward an Indian Petty Bourgeoisie: Outline of an Approach', *Economic and Political Weekly*, 26, 4 January 1991. According to Harjot Oberoi, the production of a uniform Sikh identity in the 18th and 19th century through class formation was an aid to bargaining with the British and buttressed by the colonial state through institutions like the army which recruited on the basis of religious affiliation; this process of Sikhisation worked at the expense of participation in popular religions and festivity, syncretic worship of non-Sikh deities, the fluid diversity of sects within Sikhism, as well as the ambiguous categories and borders between Sikhism, Hinduism and Islam. See *The Construction of Religious Boundaries: Culture, Identity and Diversity in the Sikh Tradition* (Oxford University Press, Delhi, 1994).

7 For instance the labelling and compartmentalising of major religions meant

suppressing or eroding huge variations among Sikhs, Muslims and Hindus as well as shared practices among them. Of the 40 million Hindus returned by the 1891 census, one and a half million were unable to record the deity they worshipped, two and a half million worshipped Muslim saints and four million indulged in varieties of animism and superstition' (William Crooke, *Northwestern Provinces of India*, Cosmo rpt, Delhi, 1987, pp. 240, 42).

8 From the late 19th century an increasingly negative and absorptive definition of Hinduism as all that was not Islamic, Christian or Zoroastrian at first made both Christianity and Islam the main opponents of a newly unified Hinduism and later after independence mainly Islam. Whether Jatis can be said to belong to the Hindu fold remains an open question; there are histories of successive, partially successful attempts to Hinduise and incorporate them into a reformed Hinduism by upper castes as well as histories of resistance by dalits ranging from anti-brahminism to emphatical refusal to be defined as Hindu.

9 Ironically, some of this is visible in the choices of some of the forebears of the Hindu right such as Lalaji Raj. Born into an Agarwal bania family, his grandfather belonged to a Jain sect, his mother was a Sikh, his father was a partial convert to Islam while Lalaji Raj himself, after some dabbling with the Brahmo Samaj, chose the reformed Hinduism of the Arya Samaj.

10 It is worth keeping in mind that one component of contemporary communal riots has been the appropriation and destruction of the other community's capital—shops, factories, stock, real estate. For the survival and growth of precapitalist institutions in symbiotic co-existence with highly exploitative modes of surplus appropriation see Anirya Kumar Bagchi, 'From a Fractured Compromise to a Democratic Consensus', *EPW*, 26, 11, 12 Annual Number, March 1991, p. 615.

11 On this point see Frederic Jameson, *Postmodernism or the Cultural Logic of Late Capitalism* (Durham: Duke University Press, 1991), pp. 304, 05, 337, 390. Jameson's remark that when contemporary religious doctrinal reaffirmation appears within 'an environment of complicated modernisation and rationalisation, it may be considered to have a simulated relationship to the past rather than a commemorative one' is also pertinent in this context.

12 For a discussion of this meaning of community see G. A. Cohen, 'Back to Socialist Basics', *New Left Review*, 207 (1994), p. 9.

13 In the pre-colonial period influential groups (such as Muslims and Rajputs) were formed from both immigrants and prior residents, occupied every social strata including ruling elites, were both law-makers and subject to local laws with a complex intertwined history. Religious group had ups and downs; there were intermittent religious persecutions of different religious groups over the centuries, but no single religious group has a history of only victimage.

14 For instance Partha Chatterjee recommends self-governing religious communities. His concern is to find a 'defensible argument' and a 'strategic politics' for minority cultural rights in the present situation. He bases these rights in the self-justificatory potentials of a

- minority – and these are in turn based on the consent” that each “religious group” will seek from its members through some form of internal elective democracy and representative institutions (such as the Gurudwara Prabhandak Committee) thrown up from political processes within each minority group (“Secularism and Toleration” *EPW* (July 9 1994) pp 1775–77). There are several evident difficulties in his formulation. The somewhat voluntarist assumptions that religious groups can generate internal political processes separate from the wider polity and that these will be democratic are fairly problematic. His ideal that an elective process will throw up true representatives of each religious group does not take operative power structures into account while the belief that community representation will be just in its own terms (to women?) seems ungrounded. The conception of community consent does not tackle consent to gender inequality where and how women will become agents in the internal transformation of religious groups or challenge their regulative powers is left undiscussed nor does the essay consider the likelihood that the democratic aspirations of many women may not or cannot be tied to communitarian or denominational identities.
- 15 For a discussion of the question of consent and that of women committed to Hindutva see Kumkum Sangari “Consent Agency and Rhetorics of Incentive” *EPW* 28.18 May 1 1993.
 - 16 On this point see also Archana Parashar *Women and Family Law Reform in India* Sage Delhi 1992 p 184.
 - 17 For instance muslim and non Muslim women protested against the Muslim Women’s Bill in 1986 while Shahbano was made to withdraw her case by religious leaders (Prasher pp 311–13).
 - 18 It is worth remembering that after the Deorala widow immolation the imagination of metropolitan ideologues overdetermined by a nativist anti colonialism was gripped by the idea of a voluntary sati as an expression of the widow’s own free will and that their notions coincided with the views of those locally involved in this and similar episodes. See Kumkum Sangari “Perpetuating the Myth” *Seminar* 342 February 1988.
 - 19 Lovibond’s attempt to describe in anti essentialist universalist politics may be useful. She points out that “the ultimate goal of liberation movements is not to invent new identities along the lines laid down by existing structures of domination but to dismantle these structures and so release the energies of each individual for the work of active (as opposed to reactive) self definition. In this sense a universalist politics, far from leading to essentialism calls into question every essence arising from social arrangements which could be amended through collective choice.” See Sabina Lovibond, “Feminism and Pragmatism: A Reply to Richard Rorty” *New Left Review*, 193, 1992, p 74.
 - 20 Chatterjee argues through a Foucauldian notion of ‘governmentality’ for an acceptance in the present political context of a situation where a group could insist on its right not to give reasons for doing things differently provided it explains itself adequately in its own chosen forum” (p 1775). He does not explain the principles by which such inscrutability will be withheld from ordained to majority religious communities or to minorities within majorities. For instance one ground for defence of widow immolation after the Deorala episode was that westernised women were strangers to the niceties of Hindu belief and therefore had no right to oppose it.
 - 21 In our context self representation may involve communalism and proprietary patriarchal new lease of life.
 - 22 For an elaboration of these see Sangari “Consent Agency”.
 - 23 Elvira Agre “Women’s Movement within a Secular Framework” *EPW* 29.19 (May 7 1994) pp 1123–7.
 - 24 Madhu Krishnaraj has pointed out that exploitative family structures which keep women subordinated by crucial support from the state through laws and rules of behaviour which legitimate the authority of the male members over the lives of members of the family (“Some Aspects of Bondage: the Denial of Fundamental Rights to Women” *Mamushi* 31 (January/February 1983)).
 - 25 Not only did the government accept religious political leaders as sole spokesmen for the entire community but the state has been party to the construction of the shariat as immutable (Prasher p 172). Hasan has also emphasised the mutual complementarity of government and religious leadership in reinforcing community identity and the narrow construction of this identity in terms of personal law. Congress ideology and political practice reduced minority rights to personal law and reduced this in turn to religious rights. The protests of Muslim women against the Muslim Women’s Bill involved confrontation of both state and community but liberal and progressive opinion was ignored. See Zoya Hasan “Communalism State Policy and the Question of Women’s Rights in Contemporary India” *Bulletin of Concerned Asian Scholars* 25.4 1993 pp 11–14. “Minority Identity in Forging Identities: Gender Communities and the State” Zoya Hasan (ed) Kali Delhi 1994 pp 63–68.
 - 26 Hindus imitated this style of defence in their opposition to the proposed Special Marriages Act from 1868 to 1872 and to its later amendments in the 1920s and 1950s this among other things was made on the ground that the Act challenged the notion of marriage as sacramental and indissoluble threatened to construct the unrestricted polygamy of Hindu men undermined the ways in which religion prevented the free choice of spouse and regulated sexuality undercut the patriarchal authority of the family and the social authority of caste. Muslim opposition which first appeared in the 1930s and 1950s was focused on the way it sanctioned intercommunity marriages (I owe this information to Amrita Chhachhi’s excellent and as yet unpublished paper entitled “Of Blood and Race: the Special Marriages Act Debates 1862–1976”). In the arguments against the Uniform Civil Code and Hindu Code bill patriarchal arrangements continued to be defended as religious rights. Hindus were vocal in defending polygamy and opposing property rights for women on religious grounds. An identical conception of patriarchal arrangements has underwritten the defense of minority personal laws by community spokesmen. The underlying assumptions of these interested representations were so well understood in the 1940s–1950s that Raj Kumari Amrit Kaur Hansa Mehta Ambedkar and Ayyar argued against freedom of religion and religious practices in the constituent assembly debates on the ground that inclusion of the word ‘practice’ would be used to prevent reform (Prasher pp 223–25).
 - 27 On this latter point see Prasher p 274.
 - 28 Prasher pp 161–6, 169–70. 309–10. Muslims objected to the Uniform Civil Code clause in the Constitution. The Minorities Commission to whom the Adoption bill was later referred recommended that religious groups should not be excluded because minorities within religious minorities have the freedom to believe profess and practice their own version of their religion (ibid pp 17–23). Regarding the Muslim Women Bill it has been pointed out that rather than opposing state intervention in the internal affairs of the Muslim community Muslim fundamentalists in fact secured the backing to enforce control over women (Amrita Chhachhi “Forced Identities: the State Communalism Fundamentalism and Women in India” in Women Islam and the State Deniz Kandiyoti (ed) Temple University Press Philadelphia 1993 p 167).
 - 29 The defence for an equivalence of male rights was evident in the common argument in the 1950s (one still being made) that by not enacting a uniform civil code the government was encroaching only upon the religious rights of Hindus but was afraid to encroach similarly on the rights of others (Prasher p 237). The most vociferous opposition to the Hindu code bill in the 1940s came from the Hindu Mahasabha. Shyam Prasad Mukherjee argued for a uniform civil code instead of reform of Hindu law but said that code had to be optional. So even at that time the opponents of the Hindu Code bill that is defenders of patriarchal privileges were also proponents of a uniform civil code! (See Rishi Soni “Jawahar Lal Nehru and the Hindu Code: A Victory of Symbol over Substance” *NMMI Occasional Papers* April 1992 pp 15–18).
 - 30 Prasher p 114. Shabdar Ezzet “Defining Women through Legislation” in *Forging Identities* p 59. In fact some argued that Hindu would accept monogamy only when Muslims did (ibid p 57). Others compared compulsory monogamy to racial suicide: it would destroy India the way it had destroyed the Roman Empire (Soni pp 20–21).
 - 31 A M Bhattacharjee *Muslim Law and the Constitution* 2nd ed Eastern Law House Calcutta 1994 pp 33–34. John Malcolm *Sketch of the Sikhs* London pp 1812 p 133.
 - 32 Bhattacharjee *Muslim Law* pp 89–91 99–104.
 - 33 The learned judge seems unaware of the figures for bigamy and polygamy presented by the Census Commission of India 1961: tribals 15.2 per cent Buddhists 7.9 per cent Jains 6.72 per cent Hindus 5.8 per cent and Muslims 5.7 per cent. See also *Report of Committee on the Status of Women* Government of India 1975.
 - 34 The report even suggests framing a “Conversion Religion Act to check abuse of religion! This would be somewhat farcical if it did not fuel communal organisations seeking to whip up hysteria over conversions, the VHP announced soon after the report claiming that it was working towards setting up 1000 Hindu missionaries to meet the challenge of

- Islamicisation and Christianisation and the consequent demographic decline of Hindus (*Hindu* July 3 1995)
- 35 Hindu personal law assisted polygamy by validating customary rituals and ceremonies, if sapta-padi and vivahahoma cannot be proved then the marriage becomes invalid (Agnes p 1125 and Flavia Agnes *State Gender and the Rhetoric of Law Reform* SNDT University Bombay 1995 pp 199 200)
 - 36 For a discussion of these and other clauses and their creation of new anti secular biases in some areas see A M Bhattacharj who points out that many of these clauses violate Art 15 of the Constitution (*Hindu Law and the Constitution* Eastern Law House Calcutta 1994 pp 130 42 see also J Duncan Derrett *Religion Law and the State in India* Faber and Faber 1968 London pp 332 33 342 K G Kannabiran 'Outlawing Oral Divorce: Reform through Court Decree' *JPW* 29 25 June 18 1994 p 1510 Bhattacharjee *Muslim Law* pp 112 13 Prasher p 100 Madhu Krishwar 'Codified Hindu Law Myth and Reality' *JPW* 29 33 August 13 1994 p 2156 While the laws do not altogether preclude inheritance on conversion they do make it more difficult and arbitrary
 - 37 See Prasher for details p 77 Since 1976 for instance Hindus who marry under Special Marriage Act inherit under Hindu personal law and not under the Indian Succession Act This amendment by which Hindus would continue to be governed by Hindu Succession Act could deter a Hindu from marrying a non Hindu woman because then he would forfeit his rights to ancestral property (Agnes *State Gender* p 700) The Act also has loopholes that can be used to prevent intercommunity marriages (Chhabhai in *Forging Identities* p 87)
 - 38 Christian women seeking reforms have produced a draft bill of Christian Marriage Act with the unanimous assent of heads of churches which is in abeyance since early 1994
 - 39 Prasher p 149
 - 40 For instance the new testamentary provisions introduced in the Hindu Succession Act with regard to ancestral property rendered property more mobile in the hand of individual male owners prevented fragmentation of urban family business or family agricultural holding and assisted fathers to obviate the newly given right of property to daughters thereby taking away women's limited customary rights and making the man's will paramount (Som pp 45 46 Krishwar p 2156) In fact the testamentary provisions were explicitly offered as a loophole through which to avoid giving women property (Prasher p 128) For a detailed discussion of gender inequalities in this Act see Rina Agarwal *Gender and Legal Rights in Agricultural Land in India* *JPW* Review of Agriculture 30 12 March 1995 p A 43
 - 41 On this point see Prasher pp 271 273
 - 42 For the feminist agency is not merely women's agency but the organised initiatives of women and men committed to distributive justice and women's equality within a democratic and egalitarian framework it does not include women committed to a right wing politics
 - 43 Rachel Harrison and Frank Mort 'Patriarchal Aspects of Nineteenth Century State Formation in Capitalist State Formation and Marxist Theory' ed Philip Corrigan (ed) Quartet London 1980 pp 81 82
 - 44 The clause on social reform was added due to the stated fears of Ambedkar and others that freedom to propagate and practice would perpetuate these injustices
 - 45 It also carries the inflections of voluntarism The historical coordinates of reforms during the colonial period were predicated on struggles within denominations class formation degrees of bourgeoisie/ment effectively part of a historical process in which public male agencies were formative and preceded those of women The same historical process cannot mechanically repeat itself and more creative broad based strategies need to be evolved
 - 46 For a discussion of new orientalist discourses see Kumkum Sangari Introduction *Representations in History* *Journal of Arts and Ideas* nos 17 18 June 1989
 - 47 In fact brahminical law had a regionally variant status and was often reduced to a useful embellishment for kshatriya hegemony
 - 48 In the debates on the Hindu Code bill Ambedkar noting the consequences of a conflation of religion and law complained The religious conceptions in this country are so vast that they cover every aspect of life from birth to death There is nothing which is not religion and if personal law is to be saved I am sure about it that in social matters we will come to a standstill There is nothing extraordinary in saying that we ought to strive hereafter to limit the definition of religion in such a manner that we shall not extend it beyond beliefs and such rituals as may be connected with ceremonials which are essentially religious It is not necessary that the sort of laws for instance laws relating to tenancy or laws relating to succession should be governed by religion I personally do not understand why religion should be given this vast expansive jurisdiction so as to cover the whole of life and to prevent legislature from encroaching upon that field (*Constituent Assembly Debates* vol 7 p 781) K M Munshi too wanted to split religious imperatives from class reproduction He argued against the protection of personal law from state intervention in secular areas of religion or those that fell within the purview of social welfare or reform he said if succession or inheritance related personal laws were believed to be a part of religion it would contradict the Constitutional promise of sex equality (Prasher p 227)
 - 49 Male individuation did not conflict with the family or religion in the way that female individuation did and still does The Hindu Gains of Learning Act (1930) provided for individual ownership of the income a person earned by virtue of his 'learning' it no longer had to be part of the coparcenary This trend continued after independence and with the Hindu Code bill men were allowed to keep their own earnings giving them the double benefit of male individuation as well as continued share in the coparcenary As Agnes points out while a space was carved for men's individual property rights within the joint family 'stridhan' for women was rolled back (*State Gender* p 191) For a discussion of some of the gaps between male and female individuation see Kumkum Sangari 'The Amenities of Domestic Life' *Questions on Labour* *Social Scientist* 21 9-11 September November 1993 p 20
 - 50 Prasher p 249
 - 51 For discriminatory and patrilineal forms in devolution and tenancy rights in agricultural land as well the variations in these in each state and in specific personal laws see Agarwal pp A 39 43-45 51-52
 - 52 Legal compartmentalisation simultaneously reflects and assists a wider process of class differentiation by devaluing or excluding certain categories of women's labour from work See Sangari 'The Amenities' pp 23 11 20
 - 53 The conception of the family as private and beyond the appropriate intervention of the law has been an important dimension of legal reinforcement of women's subordination it has been used to insulate from legal review the discrimination women face within the family (Ratna Kapur and Brenda Cosman 'On Women, Equality and the Constitution Through the Looking Glass of Feminism' *National Law School Journal*, 1 1993 p 56)
 - 54 See Kumkum Sangari 'Relating Histories Definitions of Literacy Literature Gender in Early Nineteenth Century Calcutta and England' in *Rethinking English* Svati Joshi (ed), Trianka Delhi 1991 pp 39 50 58
 - 55 Sangari 'Perpetuating the Myth' p 30
 - 56 Prasher pp 72 3
 - 57 Prasher p 76
 - 58 Personal laws were a compound of custom statute usage and case law (Bhattacharj p 66) For the transformatory effects of case law see Bernard S Cohn *Law and the Colonial State in India* in *History and Power in the Study of Law: New Directions in Legal Anthropology* June Starr and Jane F Collier (ed) Cornell University Press Ithaca 1989
 - 59 Prasher pp 272 99 100 The Anti Hindu Code Committee headed by Swami Karpatri was claiming that only pandits could sanction change (Latif in *Forging Identities* p 49)
 - 60 For instance of Punjab which had till then been under customary law For details of these provisions see Prasher pp 102 03 108
 - 61 Article 25 says that the right to freedom of religion must include the right not to believe in any religion and even to be entirely atheist
 - 62 The 1891 Census of the North Western Provinces faced with the amorphousness or syncretism of lower caste and class popular religions eventually classified Hindus by 'striking out the members of fairly recognisable religions' such as Islam and Christianity and calling everyone else a Hindu' (Crooke pp 240 42) The further expansion of the term Hinduism both backwards in time and by assimilating more and more sects occurred in the early 20th century and bestowed a spurious unity (Heinrich von Stietencron 'Hinduism On the Proper Use of a Deceptive Term' in *Hinduism Reconsidered* Gunther D Sontheimer and Hermann Kulke (eds) Manohar Delhi 1991 pp 13-16 Even Gandhi who believed in communal harmony had opposed conversion to non-Hindu faiths (Forester p 82)
 - 63 Prasher p 104 In fact this legal definition of the Hindu was further extended in order to protect male coparcenary rights to those Hindus not married under Hindu personal law by the 1976 amendment of the Special Marriages Act
 - 64 Veer Savarkar of the Hindu Mahasabha, who hated conversions of Hindus, wanted a national definition of a Hindu that could embrace Sanatani Sikh Brahmo and Arya Samaj and argued for a 'racial and cultural

- unity" (Dhananjay Keer *Savakar and his Times* A V Keer Bombay 1950 pp 130 230 65 Prasher p 109 Kishwar p 2163
- 66 The Hindu Code bill imposed patrilineal inheritance on many groups that did not practice it. Since it was designed to bring about a unity of Hindus through legal uniformity it overrode textual and customary laws or practices even when they were beneficial to women (Kishwar p 2152 2158 2163). The rights of Jain women to hold property absolutely (Prasher p 120) would now get watered down by the testamentary provision. For its other gender injustices see Prasher pp 107 118 19 128 29
- 67 Customs relating to ceremonies of marriage to prohibited relationships and to customary divorces were saved and could continue to be operative but no explanation was provided (Prasher pp 109 111)
- 68 The coparcenary clauses of the Hindu Code bill would chiefly be applicable only to upper caste/class Hindus since as Jack Goody points the prolonged association of upper groups was with joint undivided families and of the poor with stem household (*The Ancient the Oriental and the Primitive* Cambridge University Press Cambridge 1990 p 475)
- 69 Prasher p 109 Bennett *Religion Law* pp 357 58

- 79 Significantly Muslim personal law was not applied to this case because both parties were not Muslim but the same reasoning was not extended to Parsi personal law – in effect the husband's personal law predominated. They entered into a solemn pact that the marriage could be monogamous and could only be dissolved according to the tenets of the Zoroastrian religion. It would be patently

contrary to justice and right that one party to a solemn pact should be allowed to repudiate it as a unilateral act. It would be tantamount to permitting the wife to force a divorce upon her husband although he may not want it and although the marriage vows which both of them have taken would not permit it (Bhattacharjee p 88)

- 83 Azim Azmi shows how problematic such a differentialist culturalism is in the context of Euro-American racism. Comprehending both a libertarian streak and secular atomism as mirror images it is like erecting heterospatial [which] want cultures to coexist in more purity without interpenetrating. Thus we find fused in racist and inferiorist discourse like the concept of non-transmissible life styles. He criticises the British understanding of difference in cultural relativism where the relations between self and other are of difference and inclusivity their co-existence hence plurality mere geographical contiguity. The non-European world is relegated to irreducible and therefore irreducible particularism. Each culture for example Islam is represented as a monadic universe of oligarchy and impermeability consisting in its manifold instance of expressions of its essential self. He points out that Islam is not a culture but a religion living amidst very diverse cultures and thus a very multi-form entity. The manifold historical formations the Europe in the Arab the Indian are each highly differentiated but these differences or the cluster of such differences are globally articulated and unified by the economic political cultural and ideological facts of dominance. Each historical unit is moreover multivocal and Europe is no exception to this. In the light of the notion of incommensurability and its cognates appears quite absurd partly because historical units are not homogeneous self enclosed and entirely self differential entities as would be required by the assumption of univocal irreducibility. Such assumptions elide history lead to barren and naive relativist temptations dressed up as intercultural philosophical hermeneutic and to absolute relativism (*Islam and Modernities* Verso London 1993 pp 5 21 40 41)
- 84 Lovibond has persuasively argued that feminists cannot be indifferent to the modernist promise of social reconstruction or the enlightenment promise of an emancipation from traditional ways of life and their arbitrary authority. From the point of view of feminists tradition has an unenviable historical record. Yet it is in the area of sexual relations that traditional values are proving hardest to shift. Thus for feminists the project of modernity is incomplete. What then are we to make of suggestions that the project has run out of steam and that the moment has passed for remaking society on

rational egalitarian lines? How can anyone ask me to say goodbye to emancipatory modernities when my own emancipation is still such a patchy bit and miss-shaft? Lovibond critiques the distaste shown by postmodernist pluralism for modernist social movements toward sexual equality. Her description of a new pluralism is almost precisely appropriate for Chatterjee's essay: the postmodernist discovery of the local and customary the advocacy of a pursuit of truth within a *totalitarian* conservative community which should neither be made common nor be excluded from a universal context but the attraction for localities exists to represent but in a self-consciously partial point.

She points out that feminism is not to be merely transformed into a question pariah bound in a false either/or dichotomy. Localised tradition, wealth and resources, work and leisure and rights, a systematic approach to question of wealth power and labour and to elide the structural uses of violence exclude *justice*. The willful of opening a door to a return to the enlightenment ideal of a rational institution of society on rational lines. Otherwise the new pluralism is simply a quiet and therefore not to be transformed in the proposed return to customary culture. Subina Lovibond *Feminism and Postmodernism in Contemporary US Society* Rex Boyce and Ali Rattin (ed) St Martin Press New York 1990 pp 101 102 111 3 119

Ferry Laclau points out that the universal value of the revolutionary bourgeoisie freedom of equality once promoted its own cause and occasioned it give embourgeoisement when other subordinated classes began to take the imperatives seriously (*Heavenly Introduction* Verso London 1991 p 57). The contradictory character of enlightenment value of once enabling a rationalist ideology but this claim, in their political universalisation is as true of the *enlightenment* theories of colonisation as of Europe. As Samir Amin shows the universalism of the enlightenment was undercut by its own racism, its own exceptionism and its exclusivism (*Imperialism* 1982) p 108)

- 85 S N Key Uniform Civil Code *Frontier* July 29 1993 p 5 6. The judgment in the *Sarla Mudgal* case also implicitly upheld the Hindu personal law as a model for a secular uniform civil code in a way that is difficult to distinguish from Hindu majoritarianism.
- 86 Peter Ronald de Souza *Righting Historical Wrong* (unpublished ms 1995) p 12
- 87 A differentialist of histories of the constitution of ethnicity could be extracted from colonialism. The imposition of colonial rule on tribal modes of production on those that were feudal or tributary the subsequent migration of colonised groups to imperialisng countries and the demography of white settler colonisation have themselves produced at least four *distinct* registers of ethnicity with many specific subsets and with each of producing its own further constellations. Unlike many colonised countries India already had complex and variable patterns of demographic settlement and migration over the centuries accompanied by new knowledges and technologies as well as a non-settler British colonisation without a substantial influx of migrants or a wholesale

decimation of native populations with its accompanying logics of guilt and reparation. In the precolonial period influential groups were formed from both immigrants and prior residents while no single religious group has a history of *only* victimage.

The static, ascriptive definitions of ethnicity (and corollary policies of multiculturalism) as they have emerged in relation to immigrant populations in Europe derive from a conflation of 'origins', race and culture, at the expense of the dynamic multiple constitutive components and differences in the so named 'race'. Ethnicity claims are promised little except a superficial cultural 'autonomy' since processes of economic assimilation and concomitant homogenisation have continued apace.

The close association of ethnic identity claims with community claims stems from the way emigration can function to reduce differences of stratification, mute or erode complex local hierarchies, regional chauvinisms and class differences, producing a coherent community identity for emigres. (See for instance Winston James 'Migration, Racism and Identity: the Caribbean Experience in Britain' *New Left Review*, 193 1992, pp 24-25, 29, 35.) Further, as the integrative capacity of class and class mobilisation declines, ethnic identities and community mobilisation have become the language of social action. Multiculturalism can function as an attempt to break with the model of hierarchical assimilation in Euro American countries where migrant workers are at the bottom of the ladder. (See Kevin Macdonald 'Identity Politics' *Arena* June/July 1994, pp 19-20.) Minorities in India cannot be similarly identified as underclasses or victims of forcible transplantation by the capitalist labour market and have been historically subject to both processes of exclusion and inclusion, assimilation and othering.

- 88 Postmodernist multiculturalism is presented as an alternative to liberal pluralism. While the latter was shaped by a modern anthropology stressing the organic unity and boundedness of cultures, the former is allied to a postmodern anthropology stressing permeability of cultural boundaries, the impurity and contamination of cultural systems, and multiply constituted subjectivities. Critical of Eurocentrism, ghettoising discourses, and hierarchies between minor and major communities, it rejects unified, fixed, essentialist identities or communities, advocates a relational multiculturalism committed to changing power relations, and to giving sympathy and an epistemological advantage to the oppressed. Earlier variants of postmodernism were primarily interested in the psychic interfaces of hybridisation between Europe and its so-called 'others' as determined by colonisation, indifferent to those forms and processes of hybridisation on the subcontinent that were prior to or unrelated to colonisation, and largely ignored the interfaces of hybridisation among non-Europeans. These omissions, paradoxically, helped to assimilate India (and other imperialised formations) into the liberal problematic of ethnicity and multiculturalism. The preoccupation with colonisation has continued, a celebratory, transgressive, border crossing, hybrid, syncretic, multiply

valenced multiculturalism, is envisaged as a protest against or a reversal of colonial violence. But some recent versions now extend to precolonial syncretism and non-European multiculturalism, as well as to the cosmopolitanisms produced through the conjunctural overlays of European colonisation. These otherwise sharper recognitions of precolonial formations and social disparities are, however, located in a dream of decentred hypermobility or flux in which all types of mobility exist on a level plane of equivalence – whether of culture, power, subalternity, communities or multiple individual identities. Material structuration is replaced by a spatial concurrence of all that is from the 'past', i.e. a coexistence of diversities in postmodernist terms which approaches if not simulates the synchronicity of the marketplace. (For a recent example see Ellen Shohat and Robert Stam in *Late Imperial Culture*, Michael Sprinker (ed), Verso, London 1995.)

With the end of earlier forms of colonialism the major obstacle to this multiculturalism defined as a systematic principle of differentiation appears to be present national boundaries. The answer seems to lie in an autonomy for restructuring intercommunal relations – within and beyond the nation-state, according to internal and partially overlapping imperatives of diverse communities. However plural or mobile these communities may be, I do not see how such intra-communal alliances can help to resist economic imperialism or the finitude imposed by economic exploitation or to formulate an ethical horizon against which to pose the question of common rights.

- 89 The cultural history of the subcontinent involved a prolonged process of alliances, collaborations and antagonisms between incoming groups and earlier inhabitants leading to many types of 'mutual' re-formation at each stage. For instance the transnational ideological configurations formed during the early colonial period are one such instance of 're-formation' (see Sangari 'Relating Histories').
- 90 deSouza, p 8.
- 91 In regional and linguistic groupings such as Jat, Punjabi, Rajput numerous denominations exist including Christian, Hindu, Muslim and Sikh.
- 92 For earlier attempts to critique instances of syncretisms that consolidate patriarchal ideologies see the section on Kabir in Kumkum Sangari, 'Mirabai and the Spiritual Economy of Bhakti', *EPW* July 1990, and Sudesh Vaid and Kumkum Sangari, 'Institutions, Beliefs, Ideologies: Widow-immolation in Contemporary Rajasthan', *EPW* 26 17, April 27, 1991, p WS14-15.
- 93 For instance if texts are contradictory regarding widow immolation then the textual sanction had to be bolstered by customary sanction.
- 94 Devaluing women's belief systems was part and parcel of the attack on syncretic customs in the north in the late-19th century, a large number of women occupied neither orthodox Hindu nor Islamic spaces in their religious practices. See Sangari, 'Differentiating between Hindu' and 'Muslim' Women'.
- 95 On the lack of practical unity of 'Hindu' orthodoxy as well as the tension between customary law and the shastras see Goody, p 229.

96 In actual practice law would often depend on the king's will, subject to variation, while its transcendent horizon remained unaltered (J Duncan Derrett, *The Dharmashastra and Juridical Literature*, History of Indian Literature 4/4 Wiesbaden, Otto Harrowitz, 1973, p 13).

97 For instance in 18th century Maharashtra there were three normative centres – peshwa, caste group and dharamadhikari – making it possible to punish a person three times for one offence (Sumit Guha 'An Indian Penal Regime: Maharashtra in the 18th Century' NMML Occasional Paper, 1994).

98 See Sangari, 'The Amenities of Domestic Life'.

99 Prasher, p 302.

100 Reforms of Hindu law in Mysore and Baroda were more comprehensive than in presidency areas (Derrett, *Religion, Law*, pp 327-356).

101 Agarwal, p A52. Prasher points out that several legislative measures mention local customs rather than religious laws (p 68). For choices between customary and personal law see Derrett, *Religion*, p 359.

102 On caste law see Derrett, *Religion, Law*, p 287.

103 See also Hasan in *Forging Identities*, p 60.

104 Such as Goa, Maharashtra and Andhra.

105 In some respects personal laws are universalisations of specific region and caste based laws (such as the coparcenary provisions in Hindu personal law) and/or sustain an 'internal inconsistency or diversity despite universalising attempts. Some provisions are merely a continuation of laws in force prior to the drafting of the Constitution: some are unchanged carryovers from British laws. Hindu law remains uncodified in areas related to caste councils, joint family, partition, religious endowments in all aspects except control of finances – and to confound confusion, falls into an amorphous area described as customary/personal law (I owe this latter point to Rajeey Dhawan).

106 For instance in the Special Marriage Act, see note 37.

107 I owe this point to Vrinda Grover.

108 I owe this point to Vrinda Grover.

109 E P Thompson, *Customs in Common*, New York, New Press, 1991, p 97.

110 Events of widow immolation in contemporary Rajasthan have been not only structured in full knowledge of prohibitory law but also assembled around the malleability of existing law to deal with either community crimes or the nexus between religion and patriarchal ideologies (Vaid and Sangari, p WS 60). Last year, when a young married woman was raped, the Mina caste panchayat decided, in the absence of her husband, that since this had brought shame upon the community she could neither file an FIR nor be given medical attention; she bled to death. A Sansi caste panchayat authorised punishment of a bride for failing a customary community virginity test – she was tortured, stripped and paraded publicly in the village (*The Times of India*, June 28, 1995). A great deal of work needs to be done on the role of family, kin-group, caste association, class segment in determining what is customary, who the arbitrating 'communities' will be, and the choice between the customary and statutory.

Structural Adjustment Programme and Indian Agriculture

Towards an Assessment of Implications

Sukhpal Singh

In the wake of the Structural Adjustment Programme initiated in the early 1990s, it is inevitable that the agricultural and rural sector will experience its share of threats and opportunities. The severe effect of economic and policy changes in the agricultural sector will be felt in the areas of agricultural trade and capital investments in agro-activities. This paper looks at the emerging evidence on these two crucial aspects of agro-sector and argues that there will be serious distortions with the emergence of the new trade regime, both internal and external, and the dominance of agribusiness corporations by way of corporate and contract farming. The penetration of the market into the rural economy will put pressure on the already marginalised sections and make small and marginal producers an assetless workforce. The only available mechanisms to reduce this impact will be producers' organisations of various types like co-operatives, informal groups and the political pressure groups.

I Introduction

THE Structural Adjustment Programme (SAP) envisages rapid industrialisation with modernisation for attaining faster growth of gross domestic product (GDP). The basic logic of the SAP is that industrialisation will set in motion forces which generate commensurate growth impulses in other sectors of the economy as well. The condition which the SAP introduces for this kind of industrialisation and growth are: (a) substitution of the market and of private enterprise for planning and public sector leadership in industry; (b) reorientation towards export production in place of import substitution; and (c) removing the capital goods industries bias in resource allocation and letting the market do the allocation. In the context of agricultural and rural development, SAP demands as a consequence of the above condition for industrialisation and growth, downgrading of the priority to food self-sufficiency and emphasis on more commercialised and export oriented rural and agricultural economy [Krishnawamy 1994].

It is quite important to note that the agricultural and rural sector which is the mainstay of two-thirds of the population in India, is also the focus of attention now for significant policy changes and private initiatives as part of the SAP.

Already steps like reduction in subsidies and removal of some restrictions on domestic and international trade in agricultural commodities have been and are being taken. At the state level, major reversals in the area of how agricultural production is organised are under way. All this is being attempted with a view that the agricultural sector can really act as the most effective safety net

in the process of adjustment programmes both in terms of giving positive results as well as preventing some of the negative effect of a market economy [Rao 1994]. The experience of the last four decades suggest that for growth to be effective, the rate has to be fairly high, say 6 per cent to 8 per cent per annum or more. Secondly, the composition of growth is as important as the rate of growth and agriculture led growth is likely to have a more significant impact on poverty [Vyas 1993].

In this paper we look at the likely implications for the agricultural and rural sector of the new policy environment, both domestic as well as international. Section II discusses trade related aspects of the new regime and Section III looks at the role of agribusiness firm. We conclude by raising a few issues of concern to the agricultural and rural sector.

II Trade Liberalisation and Agricultural Sector

The central theme of the new policy pick-up in India is to move towards free export and import of agricultural commodities so that the level and structure of product prices can be brought in line with international prices. However, it has been demonstrated by many studies that agricultural production is more responsive to non-price factors like irrigation, technology, credit, infrastructure and so on. Thus, concentrating on non-price factors is crucial for faster agricultural growth. However, this will require not only larger financial resources but also better and more efficient use of such resources, especially in favour of rain fed and poor regions. This is basically an organisational and institutional problem involving major

changes in the way the government and its agencies have operated in the agricultural protection function [Vaidyanath 1993].

Available studies estimate that 80 per cent of increment in agricultural output in India in recent years can be attributed to variables like technology and structure, which are unlikely to be responsive to incentives or investment in the private sector. These considerations which imply is the fact that non-price factors, particularly technology and infrastructure, are likely to be more important than the price consequences of trade liberalisation, apply with even greater force to the argument that a liberalised trade generally (ie not just in agricultural commodities) would boost agriculture by removing the bias against it.

Though trade liberalisation in terms of reduction in import restriction and tariffs and export taxes can help reduce the anti-export bias of the previous policy, but this does not necessarily mean an increase in the real domestic rate (RDP) and the other micro-economic policy climate in the fiscal-financial and monetary. It is hard to offset the increase in RDP resulting from trade liberalisation measures after the expansion in production for export [Valde 1989]. This is a net effect of economywide disinflationary policy in countries like Argentina, Chile and Colombia showed that it was larger than the effect of sectoral or direct policies for agriculture like price incentives. It was found that adjustment policies reduced real protection to various agricultural commodities substantially. The responsiveness of the agricultural sector to (price) incentive in these economies showed that a price increase of a certain degree in agriculture has cumulative effect on output and overall growth. Therefore, the cost of economic policies which

discriminate against agriculture cannot be justified in terms of overall growth.

Another argument in favour of opening up the agricultural sector for exports comes from a large and persistent surplus in foodgrains in the world markets which is reflected in almost continuous downward trend in foodgrain prices. Therefore, it is argued that there is no reason why India should not take advantage of favourable price trends, should a need arise in terms of import of foodgrains. However, it is important to remember that major actors in international trade in food grains are few and they act as price leaders. The downward trend in prices is partly at least due to the mounting subsidies in the US and the EEC. There is a distinct possibility that this may halt or even be reversed despite the implementation of new GATT agreement. However, the export orientation in the case of commercial crops like cotton, tobacco, jute, etc., is fully justified as they satisfy the major conditions, i.e., there is a genuine and growing surplus after meeting domestic requirements, the ratio of export to domestic prices is favourable and there is growing international demand for these commodities [Vyas 1994].

The GATT agreement, it is argued by the official and other liberal circles, will enlarge the access of Indian exports in the world market, especially in developed countries, and thereby bring in greater efficiency in resource use in the agricultural sector. The critics of the GATT agreement fear that it will not provide a level playing field to the developing countries like India in the world markets because of many non-economic obstacles [Krishnaswamy 1994]. Further, it is important to remember that like India, many other countries would also like to maximise their exports of agricultural commodities in the newly available world markets. Therefore, the world market prices over a period of time may no longer be attractive to agricultural exports from India [Thomas et al 1994]. Secondly, there are still a very large number of people in India whose food requirements are not adequately met because they lack what A.K. Sen calls 'entitlements'. Therefore, the logic of agricultural surpluses availability on which the export argument is based may not really be tenable from a social point of view. It is also argued and quite emphatically that food after all is a strategic commodity in today's conditions and it will be impolitic to make this a plaything of the market at the national level as food security cannot be brushed aside as an old-fashioned or ultra-nationalist argument in the world conditions prevalent at present [Krishnaswamy 1994].

The proponents of the GATT agreement argue with the help of statistical evidence that the GATT proposals in the area of agricultural trade, i.e., market access, domestic support and exports, will not have any negative impact on the Indian agriculture. It is found that the domestic support levels in India are negative in most of the agricultural commodities which is in sharp contrast to the levels prevailing in developed countries. Further, they also point out that the GATT agreement would lead to the expansion of trade volumes in general and in agricultural commodities in particular, and will lead to an increase in the prices of these commodities, besides bringing stability in world prices. So far as market access is concerned, it is argued that the provision in this regard does not mean that there will be a flood of imports because (i) if the prices of agricultural commodities in the domestic market are below international levels, imports will not be able to compete, and (ii) if the country from where the product is being imported is indulging in dumping, special provisions of the agreement allow for imposing additional tariff [Gulati and Sharma 1994].

However, quantitative studies of the GATT agreement reveal that the welfare implications of these proposals will vary across groups of countries from as high as an increase of 2.1 per cent of GDP in the case of other west European economies to as low as 0.6 per cent of GDP in the case of the rest of the world, which includes all the African countries, all Latin American countries except agricultural exporters like Brazil, Argentina and Cuba, and all of the Asian countries except the four tigers and the big powers, i.e., China, Japan, and the Philippines. It is found that the gains from new trade agreement for the developing countries will be mainly in agriculture, minerals and light industries, that too in employment only. So far as welfare implications of new agreement for these countries in terms of generation of income and output are concerned, it will be negative in agriculture and significantly positive in textiles and services. On the whole, the developing world, i.e., countries from Asia, Africa and Latin America, will benefit the least from this agreement. The major beneficiaries will be the EEC, the US, Canada, Japan and the Western European economies and the four Asian tigers [Nguyen 1993]. Besides, the share of agricultural commodity in total world exports has also been declining in relative terms over the last one-and-a-half decades. This, coupled with the fact that the terms of trade in agricultural commodities have not been favourable in the past, will mean

that pinning hopes on agro exports may not be an objective judgment. Besides, there are other implications inflicted on the rural economy as a result of the agreement to the treaty by the Indian government which result from the patents provision and investment measures.

The linking up of the Indian economy with the world economy especially in the area of agricultural commodity trade will lead to greater price instability as the prices of most agricultural commodities in the international markets are more volatile than those in the domestic market. Under free trade, prices of rice and wheat are likely to go up and those of oilseeds to go down. As oilseeds are largely grown in dry land areas or where irrigation facilities are inadequate for growing high value crops, free trade will adversely affect the realisation to the growers in these areas and thereby accentuate the regional and inter-farmer inequalities.

The export of agricultural products is desirable only in areas where there is scope for value added and thus employment generation and wherein the terms of trade are favourable to developing countries. The terms of trade are unfavourable and unstable in unprocessed agricultural output; the export of which should be avoided in order to ensure domestic availability of food at reasonable prices.

The liberalisation of agricultural trade within and outside the country and doing away with state support will also mean that the relatively agriculturally developed regions/states will benefit at the cost of backward areas/states. This has implications for accentuation of regional disparities and conflicts. It is not clear how market instruments will take care of such problems which could happen across crops and regions, e.g., sugarcane growers of Maharashtra benefiting at the expense of sugarcane growers of Uttar Pradesh.

III Growth of Agri-business

Under the new economic policy (NEP), the agri-business sector has emerged as an important area for export and employment promotion and government support. The assumption (or rather belief) is that it is crucial to provide marketing and processing facilities to the agricultural production sector for its viable growth and development. The new approach to agriculture in terms of agri-business, means that the character and structure of Indian agriculture will be sought to be so transformed as to make its organisation, finance and management little different from those of private manufacturing and trading sectors. This essentially means industrialisation of rural

production and becoming important in agriculture as a separate sector which will become increasingly a sub sector of industry in the agro industrial chain of production [Goodman et al 1987, Krishnaswamy 1994].

Since the requirements of export markets tend to be different from those of domestic (agri business) markets, the organisation of rural and agricultural production will necessarily undergo a change in favour of large scale operations and financing. Therefore, there will be attempts (in fact, there are) to organise corporate and contract farming and pump capital by agri business firms in the agricultural production sector. There are also serious attempts being made to do away with the ceiling on land holdings which the agri corporations and large farmers are finding as a constraint in their business plans.

However, it is important to look at the long term implications of the growth of agri business for the marginalised sections of rural producers of the agriculture. The experience of Latin American and African countries shows that agri business companies and corporation operating through the contract system to ensure quality and quantity of raw material at appropriate time and cost in India capture farming by agri business firms on a wide scale and is being allowed to multiply under the liberalised environment and contract and co-operative farming is already present in many areas. However, the trend seems to be more towards contract farming as the cases of Pepsi HC and other companies suggest [Singh et al 1994].

In fact, the penetration of market into the rural areas, especially the land market, is likely to affect the asset base of the small and marginal farmers who are increasingly selling or leasing out land to the agri business corporations [Acharya and Acharya 1995]. This is very likely to lead to alienation of land from the owner producers and convert them into wage workers.

Another argument in favour of market economy operations in agriculture is made by citing the example of Punjab state where agricultural growth has taken place largely in private hands without measures like co-operative farming or co-operative marketing and processing organisations. However, what is important to remember is that the model of development which Punjab has followed necessarily demanded that kind of support organisations and arrangements. This particular model of agricultural growth has led to marginalisation and pauperisation of small land holders whose holdings became unviable as the costs of cultivation rose. That is why there has

been a net decline in the number of marginal and small holdings. This is being interpreted as consolidation of holdings by some people. At what cost has this consolidation been achieved? This so-called consolidation is the result of the process of expropriation in Punjab where marginal and small farmers have been displaced out of land to large mechanised capitalist resource rich farmers. What this holds in terms of employment and social tension implications, nobody seems to consider. Further, the system of contract farming has benefited only the large capital rich farmers and a firm would not like to farm with too many resource poor farmers for the procurement of its raw material. The system also neglects the contract farming does not stand on a contractual relationship and ultimately turns out to be a loss because by the time contracts run out, either they become dependent on the agri business firm for the sale of the output. Also, many corporations imposed on the farmers a system of hiring which is to be a 'quality price' and penalties [Feder 1996, Glover et al 1990, Kervick 1992, and Nand 1995].

Besides this, the changes in cropping pattern due to the entry of agri business firms lead to decline in production of cereals which is the main food for the rural poor. Thus, they become dependent on the market for their food, which may not be available at reasonable prices [Ruth 1985]. Even the promise of employment generation is empty one as the employment generated in the processing factories is low because a number of jobs lost in the crop sector due to changes in cropping pattern. A recent study shows that agro industrial development led to significant fall in agricultural employment and generated only a small number of jobs that too only for women as they are available at low cost [Young 1993].

The differentiation of the peasantry which agri business leads to is a very serious matter and has implications for increasing inequalities in the rural society. Even Swaminathan, one of the architects of SEAC (Small Farmers' Agri Business Consortium) cautions that the SEAC will help to take the benefits of modern agri business to the small and marginal farmer and landless labourers only if it remains pro nature, pro poor and pro women [Swaminathan 1993].

IV Conclusion

The introduction of market economy in the agricultural and rural sector which is likely to intensify in the coming years

requires a serious effort to design strategies that will direct the market along the line of larger development objectives while ensuring growth. The resource poor in general and the rural poor in particular are handicapped in responding to market signals at two levels. First, they find entry into the markets very difficult, especially those who do not have assets or skills. Second, even when they enter the market, they are not able to obtain fair returns. The latter is because of the low reserve price they set for themselves and the high transaction cost when they enter the transacting part of the market. There is a need to overcome this barrier of risk which the poor have to take into account. The state has an important role in making markets profitable and fair to them, thereby rescuing the poor by helping in the reduction of transaction cost and in creating mechanisms to protect them with

While entering into the market to find a competitive advantage within agriculture, certainly necessary, it does not necessarily follow that it is long run competitive advantage as in agriculture, even when the market is open and limited water comes. Moreover, it is unlikely that it will improve the situation in the Indian context. Furthermore, the crowds out private agri business which is critical to reap the benefits of comparative advantage.

As far as employment is concerned, it is important to note that recent trends suggest that the elasticity of employment with respect to output is declining rapidly such that the increasing employment potential of the agricultural sector becomes less, particularly in pockets of high farm productivity and in the secondary effects of higher agricultural output on employment, which may be more important. In this context, it may be noted that agricultural trade liberalisation may have no effect on employment in cotton and seed production, which are expected to decline, have a minor effect on other crops. And employment in the cotton textile sector is also likely to be affected adversely despite higher raw cotton production because free trade is likely to reduce the international competitiveness of this industry. It is possible, of course, that more positive results may follow if trade liberalisation causes a massive take off in fruit and vegetable production and processing. But this will depend on the development of infrastructure and export market links and in any case, does not really require that agricultural trade be liberalised generally.

Perhaps what is required is a shift in the focus of state intervention and support and

not its withdrawal from the rural sectors of the economy. It has to cater to the unorganised sectors of agricultural and non-agricultural economies in order to help them participate in the market mechanism so that they could also benefit from the new growth opportunities. In the rural sector, these sectors include dry land farming regions which need infrastructural and market support, and the green revolution regions which require more liberalised policy and regulatory framework so far as agriculture is concerned. The coping mechanisms which will become increasingly crucial to organise and promote will include co-operatives in production sectors, and saving and credit groups in the financial sector and pressure groups in the social and political sectors which will decide the fate of production and financial sector activities.

ENERGY SUPPLY OPTIONS

The strategy for taking care of energy requirements of Phaltan taluka is based on biomass resources. Thus, the cultivable land area of Phaltan taluka has to provide for food, fuel, fodder and fertiliser for its inhabitants. If all of these can be provided then the taluka can become energy self-sufficient. Besides it can also show the limits to growth. As a future possibility, if some mechanism is found by which residents of the taluka only consume the energy they produce from their area then it can point towards a truly sustainable society.

From Table 2 it is also evident that energy in the form of electricity, liquid and gaseous fuels accounts for 93 per cent of the total energy purchased in the taluka. Hence renewable energy supply options should replace this energy sources. Besides, the supply options may become operational earliest by 2000 AD. Hence it is instructive to develop the strategy to supply the energy demands for 2000 AD. Table 3 shows the possible energy consumption for the taluka in 2000 AD. The data are generated by taking into account the historical growth rates from Table 2.

It is proposed that the energy supply options will have the following components: (a) Liquid fuel production via: (i) Ethanol production from sweet sorghum, (ii) Ethanol production via molasses from sugar factories, (iii) Pyrolysis oil production from biomass residues, and (b) Electricity production via 30-40 MW biomass based power station and cogeneration from sugar factories.

Ethanol Production from Sweet Sorghum: Area under jowar (sorghum) in the taluka is 48,500 ha [NARI 1991]. Most of this area is grown under rainfed conditions and can easily be put under sweet sorghum (S.S.) crop. This can be done since there is little difference between the agronomy of grain sorghum and sweet sorghum crops. Under rainfed condition S.S. varieties developed at Nimbbkar Agricultural Research Institute (NARI) can produce about seven tons of fresh stalks/ha and 0.25 tons of grain/ha. Thus Phaltan taluka has the potential of producing 340,000 tons of sweet sorghum stalks and 12,000 tons of grain. Sweet sorghum stalks are an excellent source of fodder for cattle and hence after taking care of all fodder requirements of the taluka about 240,000 tons of sweet stalks remain. Data have also shown that one tonne of S.S. stalks can produce 40 l of 95 per cent (v/v) ethanol. This yields a production capability of 9.6 million litres of ethanol per year in Phaltan taluka. This alcohol can be produced from a 32,000 lpd distillery which is a medium-sized unit [Rajvanshi et al. 1989].

With the increasing emphasis on green technologies, most of the modern distilleries can also produce biogas from their effluent. Their norms are production of 28 m³ of biogas/m³ of effluent produced [Szendrey 1984]. Hence 9.6 million litres/year of ethanol distillery will produce $\sim 3.8 \times 10^6$ m³/yr of biogas. This can easily be used as energy for ethanol distillation and can thereby release

65,700 tons (dry)/yr of sweet sorghum bagasse. This bagasse has potential to generate ~ 8.7 MW electricity via a biomass power plant.

Ethanol production via molasses from sugar factories: Phaltan taluka has two sugar factories with total crushing capacity of 3,700

tons of cane per day. They produce about 23,300 tons of molasses during their crushing season. This molasses can generate about 5.6×10^6 l of ethanol (95 per cent v/v) [Paturau 1993]. The biogas generated via effluent treatment can be used for running the distillery. At present one distillery attached

TABLE 2. ENERGY CONSUMPTION (YEARLY) DATA FOR PHALTAN TALUKA (1991)

Fuel	Quantity	Units	Fuel Calorific Value	Total Energy ($\times 10^3$ MJ)	Growth Rate Per Cent Per Annum	Per Cent of Total	Use/Remarks
Electricity	—	—	—	—	—	—	—
Urban	19.5×10^3	kwhr	3.6 MJ/kwhr	34.47 (12.05)	16.2	33.0	Residential 18.7 per cent Industrial 17.5 Per cent
Rural	76.25×10^3						Agricultural 56 per cent Rest 7.2 per cent
Petrol	14.57×10^3	litres (l)	32 MJ/l	4.66 (2.44)	9.7	4.5	For cars and two wheelers
Diesel	5.677×10^3	l	35.5 MJ/l	20.3 (10.96)	9.0	19.46	Mostly for tractors, jeeps and some for pumpsets
State Transport buses	1.851×10^3	do	do	6.59 (4.53)	5.5	6.3	Only for S.S. buses
Kerosene	4.285×10^3	l	34 MJ/l	14.57 (10.45)	5.0	14.0	Mostly for cooking lighting and two wheelers
LPG cylinder	56400 Each has 14.2 kg gas	Nos	44.2 MJ/kg	3.54 (1.2)	16.7	3.4	Mostly for cooking
Biogas	2926 Each is 6 m ³ /day capacity	Nos	20 MJ/m ³	12.81 ()		12.4	For cooking
Wood	4015	Tons	14.8 MJ/kg	5.9 (4.14)	5.2	5.7	For cooking bakeries and brick kilns
Coal coke etc. charcoal*	306.6	Tons	28 MJ/kg	0.85 (0.83)	0	0.8	For cooking bakeries etc.
Total				103.4 (46.6) $\times 10^3$ MJ			

- Notes: 1. Data for 1984 in parentheses.
2. The electricity consumption was obtained from MSEB offices both at Phaltan and Lonand towns.
3. Petrol consumption was obtained from the three petrol stations in Phaltan and one in Sakharwadi.
4. Diesel consumption was obtained from diesel stations. The state transport data was obtained from Phaltan bus depot.
5. Kerosene supply data was obtained from the supply officer, Phaltan taluka office. Anecdotal data suggests that a major part of kerosene is diverted for running the two-wheelers.
6. LPG cylinders data was obtained from all the suppliers in Phaltan.
7. Biogas plants data was obtained from Panchayat Samiti office. This office gives the subsidy to the biogas plant owners for installing them.
8. Data on wood, coal, charcoal, coke etc. was obtained from the wakhars (wood suppliers).

TABLE 3. ESTIMATES OF COMMERCIAL ENERGY USE IN PHALTAN TALUKA IN 2000 AD

Fuel	1991 Consumption	Growth Rate Per Cent Per Annum (Table 2)	2000 AD Consumption	Energy ($\times 10^3$ MJ)	Per Cent of Total
Electricity	9.575×10^3 kWhr	16.2	3.7×10^4 kWhr	13.32	55.9
Diesel	7.478×10^3 l	9.0	1.62×10^4 l	5.76	24.2
Petrol	14.57×10^3 l	9.7	3.35×10^4 l	1.07	4.5
Kerosene	4.285×10^3 l	5.0	6.65×10^3 l	2.26	9.5

Total				23.83	100.0

o a sugar factory uses steam from it, and uses wood during off-season

Pyrolysis oil production from biomass residues Pyrolysis oil is produced by rapid pyrolysis of biomass [Cottam and Bridgwater 1994]. This oil is highly oxygenated with heating value of ~18 MJ/kg. It is equivalent to No. 6 heating oil and has been experimentally evaluated as furnace oil substitute [Cottam and Bridgwater 1994]. Recently it has been used as a diesel substitute in compression ignition (CI) engines [Solantausta 1993]. Thus conversion of biomass residues to pyrolysis oil is projected as the most competitive liquid fuel from biomass [Solantausta 1993]. On an average, 1 kg (dry) of biomass produces 0.75 kg oil, 0.1 kg of char and 0.15 kg producer gas [Beckman and Graham 1994].

As seen from Table 1 Phaltan taluka produces ~210,000 tons of agricultural residues. Out of this, ~96,000 tons of residues are from grain sorghum (jowar). Since all the grain sorghum area will be replaced by sweet sorghum the residue production will be ~100,000 tons/year (with residue collection efficiency of 88 per cent) [NARI 1991]. The area under cultivation in the taluka is 75 per cent of total area hence it is estimated that this much residue production will remain more or less constant in future.

The pyrolysis oil can replace diesel oil and kerosene and hence only that amount of agricultural residues should be used which will produce enough pyrolysis oil for above replacement. Thus, the amount of residues come to 60,000 tons/year. The rest 40,000 tons can go for electricity generation.

This residue can produce 45,000 tons of oil, 6,000 tons of charcoal and 9,000 tons of producer gas. The gas is used internally in the plant for oil production and hence oil and char are the only useful products for external consumption [Cottam and Bridgwater 1994]. For this oil to be used as diesel substitute in CI engines, about 10 per cent diesel will be required as a pilot injection since only 90 per cent of diesel consumption will be saved [Solantausta 1993].

Electricity production from biomass Phaltan taluka will at least require 3.7×10^8 kWh of electricity by 2000 AD (Table 3). This amount of electricity can be produced as (i) Cogeneration by existing two sugar factories in Phaltan and (ii) From a biomass-based power station using 40,000 tons of agricultural residues, and wood from energy plantations based on fast growing tree species.

In Phaltan taluka there are two sugar factories with total crushing capacity of 3,700 tons of cane/day. They are old units with inefficient machinery. With improved high pressure steam boilers they have capability of generating 50 kWh of surplus electricity per ton of crushed cane [Bouvet 1993]. Thus, they are capable of producing $\sim 3.9 \times 10^7$ kWh of surplus electricity during crushing season. This season lasts normally for 7-8 months (personal communication, Phaltan Sugar Works, June 1994). Similarly, surplus bagasse (65,700 tons) from sweet sorghum distillery can produce 7.6×10^7 kWh whereas 40,000 tons of agricultural residue can

produce 4.6×10^7 kWh of electricity. Thus, the shortfall in electricity production will be $\sim 21 \times 10^7$ kWh. This can be met by running a biomass powered plant on fast growing tree fuel [Rajvanshi 1991]. All the above residue together with wood fuel from trees will be fed to two 22 MW power plants. Thus with the norm for energy plantation of 600 ha/MW area under tree plantation will be

about 16,000 ha. Around 9,000 ha government 'forest' land in Phaltan taluka which is under non-existent forest could easily be utilised. The remaining 7,000 ha land could be a combination of wasteland and farmers' land where energy plantation will be grown as a crop for remunerative purposes [NARI 1991].

Table 4 shows the energy supply options

TABLE 4 ENERGY SUPPLY OPTIONS FOR PHALTAN TALUKA BY 2000 AD

Biomass Energy and Its Quantity	End Product Quantity	Plant Capacity	Fuel Cost (Rs/ton)	Energy Produced ($\times 10^6$ MJ)
Sweet sorghum 240,000 tons/yr	a) 9.6×10^4 l of 95 per cent (v/v) ethanol b) 65,700 tons of bagasse	32,000 litres/day distillery	0.50 (L)	1.92
Molasses from sugar factories 24,300 tons/yr	5.6×10^4 l of 95 per cent (v/v) ethanol	16,000 litres/day distillery	0.50 (L)	1.12
Agricultural residues 60,000 tons/yr	45,000 tons pyrolysis oil 6,000 tons charcoal	200 tons/day pyrolysis plant	18 (M) (oil) 20 (M) (kg) (10)	8.1 1.2
a) Energy plantation on 16,000 ha land	2.184×10^8 kWh of electricity	Two power plant of capacity 22 MW each	36 (M) kWh	13.25
b) 65,700 tons of bagasse	0.76×10^8 kWh of electricity			
c) 40,000 tons of residues	0.46×10^8 kWh of electricity			
Cogeneration from sugar factories	0.39×10^8 kWh of electricity	Existing sugar factories with total crushing capacity of 3,700 tons/day	56 (M) kWh	1.4
		Total		26.59 ($\times 10^6$ MJ)

LPG cylinders	226420 Numbers	96/cylinder	2.17	3.65	4.6 (2)
		Total		83.05 (226.5)	99.8

Notes: 1 Existing heavily subsidised price for rural areas

2 MSEB opportunity cost

3 This is an average price of kerosene

4 Figures in parentheses are for Rs 2.8/kWh electricity unit price

for Phaltan taluka in 2000 AD. It is also instructive to look which supply option fuels can replace the existing fuels. Table 5 shows the replacement strategy. From this table it is evident that total supply options yield more energy than is required for the taluka in 2000 AD. This excess energy can be used by citizens of taluka thereby increasing their net per capita consumption or it can be exported (especially alcohol). It is also evident that the supply option strategy may undergo further refinement. However, the point to emphasise is that the taluka can generate enough biomass to take care of all its energy needs by 2000 AD.

TECHNOLOGICAL ISSUES

The above energy supply scenarios can only become a reality if the technology is fully developed and it can supply the energy economically to citizens of Phaltan taluka. The following technological issues will therefore have to be addressed:

- (1) Harvesting and baling/compaction of agricultural residues will have to be mechanised for ease of transportation and also for reduction of cost of biomass.
- (2) The pyrolysis oil technology is still in early stages of development. However, enough confidence has been achieved on pilot plant basis such that vendors do have plans for setting up 200-250 tons/day pyrolysis oil plants. Pyrolysis oil has been successfully tested as furnace fuel oil but its use in small stoves for cooking still needs to be developed [Huffman et al. 1994]. Pyrolysis oil use in a diesel engine is still in R and D stage. However, early encouraging results have shown that with diesel pilot injection (10 per cent) and additives like ethanol it should be possible to run any diesel engine with pyrolysis oil [Solantausta 1993].
- (3) The technology for producing power (via 30-40 MW plants) from biomass is fully developed as is the technology for producing alcohol from sweet sorghum [NARI 1991; Rajvanshi et al. 1989]. Similarly, ethanol based cooking stoves

- have been used in many parts of the world.
- (4) Production of combustible gases for thermal applications using charcoal gasifiers is a well developed technology. Large scale horticultural farming is coming up in Phaltan taluka. Simultaneously, food processing units have also been set up. These units consume large quantities of heat energy (~80 per cent of their total energy needs) for processing. It is envisaged that horticultural biomass residues can fuel biomass gasifiers for direct heat applications in these units.
 - (5) Taluka's geographical area also lends it to become a water basin. With average rainfall of 500 mm/year, a total of 585 million m³/year water falls on the taluka area. With proper watershed development and management (e.g. building more water percolation tanks), the crop productivity of the taluka can increase. This can further increase the availability of crop residues besides giving more remuneration to the farmers.

ECONOMIC ISSUES

Precise economic analysis of the above energy scenarios is difficult to do since it is dependent on variables like biomass cost, diesel and petrol cost, and also electricity pricing policy for rural areas. All these are quite unpredictable and are dependent on government policies and international situation.

However, a simple analysis based on historical trends has been attempted. Table 6 shows the money that will be paid by the taluka for importing energy in 2000 AD. The cost accounting is done for 1994 prices at energy levels of 2000 AD (Table 3) and then corrected by 10 per cent per annum inflation rate so that cost for 2000 AD is obtained. Historical data for changes in energy prices do show an average of 10 per cent increase and hence as a first order exercise the inflation correction seems reasonable [TFRI 1992].

It is evident from this table that the pricing

of electricity is artificial and is based on political considerations for rural areas. The data from Maharashtra state electricity board (MSEB) shows that if MSEB sets up a thermal power plant today the electricity cost will be Rs 2.8-3/kWhr (Personal Communication, Ashok Harne, MSEB, September 1994). This includes line and transmission loss charges of Rs 0.6-0.7/kWhr. Thus, if proper pricing is done for rural areas (e.g. Rs 2.8/kWhr is charged) then the energy cost for electricity increases to Rs 183 crores and the total energy import bill for the taluka will be Rs ~227 crore.

Table 7 shows the economics of supply options. Detailed costing for these technologies has been done in literature cited. For 2000 AD prices, 10 per cent inflation rate correction has been made.

From this table it is clear that the major cost is in the production of electricity (64 per cent). However, it should be noted that the present electricity pricing for rural areas is heavily subsidised and it is quite likely that by 2000 AD a uniform electricity pricing policy will have similar rates as shown in Table 7 [Parikh 1993].

Thus, it is clear from this study that renewable energy options based on biomass are very attractive as compared to fossil fuel ones, only if proper rural electricity pricing is done.

Increased energy production through agro-based systems will also increase the net income for the farmers. Thus, it will be Rs 2.4 crore from sweet sorghum stalks, Rs 1.4 crore from energy plantation and Rs 1.0 crore from agricultural residues which will result in a total of Rs 26.4 crore/year net income for the taluka farmers [Rajvanshi et al. 1989; NARI 1991]. Besides, with the labour input norm of 2 labourers/day per hectare of irrigated farm, there is a possibility of employment of 30,000 labourers in the taluka. The potential of other levels of labour force joining, once the agro-energy system is finally set up, is also great. This has been aptly shown by existing sugar factories in rural Maharashtra [Attwood 1993].

TABLE 7. COST OF SUPPLY OPTIONS FOR 2000 AD

Energy/Fuel	Quantity	Plant Capacity	Biomass Cost (Rupees)	1994 Prices		2000 AD Prices*		Total Cost (Rs crore Per Year)	Per Cent of Total
				Capital Cost (Rs crore)	Unit Cost (Selling Price in Rupees)	Capital Cost (Rs crore)	Unit Cost (Rupees)		
Electricity from biomass	3.4 × 10 ⁶ kWhr	2 × 22 MW	1/kg	132.0	2.28/kWhr	234	4.04/kWhr	137	64.0
Cogeneration from sugar factories	0.39 × 10 ⁶ kWhr	7.7 MW	N	12.0	0.54/kWhr	21.2	0.96/kWhr	3.72	1.74
Ethanol from sweet sorghum ¹	9.6 × 10 ¹	32,000 lpd distillery for 95 per cent (v/v) product	300/ton S.S. stalks	9.6	14.5/litre	17.0	25.68/litre	24.65	11.52
Ethanol from molasses ²	5.6 × 10 ¹	16,000 lpd	2000/ton molasses	2.0	12.5/litre	3.5	22.14/litre	12.4	5.8

FERTILISER ISSUES

With almost all the agricultural residues taken for energy generation, the fertiliser issue can become critical. However, there exists enough potential for making fertiliser from night soil and composting of weeds and vegetable waste so that the possibility of fertiliser issue to be solved exists.

Phaltan taluka consumes about 2,870 tons (T) of synthetic nitrogen fertiliser every year (~420 T of P_2O_5 and 100 T K₂O are also used) (Personal Communication, Fertiliser Shops in Phaltan, June 1994). From night soil and cattle dung which does not go into biogas digester, there is a possibility of producing ~1200 tons/year of nitrogen fertiliser [Stoner 1975]. Recently, farmers in Phaltan have started to use vermiculture techniques for composting vegetable waste and weeds [Bhiday 1994]. With more profits from cash crops like vegetables, the acreage under them is increasing. Composting of these wastes can make a good organic fertiliser and may provide for rest of the nitrogen fertiliser needs of the taluka.

Recent data have shown that ploughing back of agricultural residues in the fields helps sustainable agriculture [Grieshop and Raj 1992]. But it should be pointed out that farmers will try to maximise their profits from land and an income generation scheme of supply of these residues for energy purposes will perhaps appear to be more attractive to them.

MANAGERIAL, POLICY AND ENVIRONMENTAL ISSUES

The following issues will have to be addressed before the above energy scenarios can become operational.

- The agro-energy systems require interaction with a large number of farmers. Thus biomass resource mobilisation is one major activity of such enterprises. The existing sugarcane co-operatives do provide a charter for such agro-energy units. However, recent criticism of these factories as a base for corruption and political patronage points in the direction of a joint stock company as a more favourable possible management set up [Attwood 1993].
- For the ethanol economy to become operational, it is necessary for the government of India (GOI) to take a policy decision of allowing the use of ethanol both for IC engines and as a fuel for cooking. Appropriate measures such as use of additives will have to be taken so that it is not diverted for potable purposes.
- The pyrolysis oil production and utilisation technology is still in the nascent stage. There is, however, a need for setting up a pilot plant to evaluate the technology and efforts should be mounted for its use in CI engines. Rapid and extensive R and D is required in this area.
- Provision of all commercial energy by biomass at taluka level has tremendous implications for the GOI. Such model replication in other talukas can save the

country foreign exchange in import of petroleum products and also reduce the burden of provision of utility infrastructure to far-flung areas of the country. Hence tax incentives should be given to parties who would like to set up such utilities in taluka areas. Similarly government policy should be changed regarding buying of large areas of land by companies for setting up agro-energy industries.

- Energy self-sufficient talukas have a potential to offer an alternative development model to the megacity-oriented existing model. This might lead to decentralised, rural-based high technology society which probably will be the future of all nations. Hence, it is advantageous for the developed countries to partake in this experiment. Thus, the international aid agencies should help in setting up agro-energy companies in taluka areas of India.
- Finally, the environmental considerations will overshadow all other considerations in the energy scenario. Recently, it has been shown that open biomass burning is as dangerous for ozone depletion as CFCs [Mano and Andrea 1994]. The use of biomass residues (which are presently burned in open fire in Phaltan) for energy production offers an environmentally safe way of using them. Besides, the use of biomass for energy production will create conditions for more biomass production thereby also helping in wasteland development and consequently in environmental improvement.

It should again be emphasised that though the above mentioned energy plan may undergo further refinement, the idea behind presenting it was to start a debate on the need of setting up energy self-sufficient talukas. There may, however, be some talukas in India where the level of agricultural residues may not be enough for the above type scenario. However, wind, solar, hydroelectric and other renewable energy systems may provide the necessary energy. Thus energy self-sufficient talukas may provide an alternative development model to megacity-based, centralised energy-driven model of developed countries.

It has been shown that it is possible to meet completely the energy requirements of Phaltan taluka for 2000 AD from agricultural residues and from biomass specifically grown for this purpose. The economics of supply options from agro-energy industries is dependent on the proper electricity pricing policy for rural areas. If the rural areas are charged the normal electricity price, then the economics of biomass energy supply options becomes attractive.

[The author gratefully acknowledges the help of N Rath of Indian School of Political Economy, Pune who was kind enough to critically evaluate this manuscript and offer valuable suggestions.]

Writing History

Anita Chakravarty

It is surprising that Ramachandra Guha ('Subaltern and Bhadrakol Studies' August 19) should claim (1) that writing about the elite 'is emphatically not subaltern studies' and (2) that history should be written only from 'the field and the archive'—the law court and the newspaper office—and not from the library.

One of the first things we learnt as students in the mid-1980s about subaltern studies was that subalternity was not a thing that belonged to some social groups: it was a relation. It is perfectly possible—and in fact is most often the case—that those who are in a position of domination in one relation are simultaneously in a subaltern position in another. Surely every researcher today is aware that even among the most oppressed and disprivileged groups there are relations of domination within—those between men and women, the old and the young, between one low-caste group and another. Why does it seem to Ramachandra Guha that a study of new forms of subordination of women in middle-class families (Dipesh Chakrabarty's essay in *Subaltern Studies VIII*) is not about subalternity? One might also say that a most productive move in the recent works of the *Subaltern Studies* group is precisely their problematisation of the subalternity of the nationalist elite—a formulation that clearly has major implications for our understanding of the new patterns of domination under the post-colonial regime.

Guha's complaint about 'abandoning the archive for the library'—with its sentimental evocation of the historian as a craftsman with soiled hands—is so patently ridiculous that it hardly deserves comment. However, there is a more special point that needs to be made here. Historians of modern India have always known, but have rarely thought about, the fact that the material in our official archives—with negligible exceptions—are all in the English language. This enabled generations of historians of modern India to practise their 'craft' without using—and in many cases without even knowing—a single Indian language. The first attempts by *Subaltern Studies* historians, trying to work their way out of this historiographical tradition, were marked most notably in Ranajit Guha's pioneering work by innovative techniques to read the presence of an insurgent consciousness from what were most often English-language colonial accounts. But the question of finding traces of subaltern voices in an Indian language archive remained

unanswered. Yet it was surely obvious to everyone that the vast masses of the Indian people did not think, speak, dominate or revolt in the English language.

One possibility, of course, was oral history, which has been used very fruitfully in many studies on modern Indian history in the last two decades, perhaps most consummately in the recent book by Shahid Amin reviewed by Ramachandra Guha. But the limitations of oral sources are well known, and for the development of any sustained historiographical practice they could be an important supplement to—but never a substitute for—the archive.

Perhaps the most significant contribution of recent works in *Subaltern Studies* to the craft of the historian of modern India is the sustained way in which they have focused attention on—and indeed shifted the terrain of debate to—the field constituted by the printed literature of the last two hundred years in the modern Indian languages. It has already become clear that this is the principal archive for modern Indian history, containing far richer treasures than the official archives, especially for the historian of the subaltern classes. Contrary to what Ramachandra Guha believes, this does not make it very easy for the historian—not at all. As someone who, as a research student, has made the move from the official archive to the library, I know that working with printed literature, at least in Bengali, is far more arduous, time-consuming and frustrating than working in the archives. This is for the simple reason that this 'other archive'—that of the printed literature in Bengali of the last two hundred years—does not physically exist in any one place, even as a library. A researcher usually has to hunt around in a dozen libraries in and around Calcutta, without the benefit of usable catalogues; for the fortunate few who have the opportunity, the best source is still Vernacular Tracts collection at the India Office Library. I cannot believe that the situation is any better for other Indian languages.

In fact the recent move into cultural history in which *Subaltern Studies* historians have played a leading part has meant that this other archive is now literally beginning to be put together piece by piece, with new bibliographies, catalogues, reprographs and microfilms. The possibilities for subaltern history are immense. Only a tiny fraction of what was printed in the 19th and 20th centuries has entered academic history-writing, even for the literary disciplines in the Indian

languages, since the majority of printed matter did not qualify as worthwhile literature and were not preserved in libraries or written about by scholars. Putting together this alternative archive will mean not just that techniques of 'reading against the grain' could be applied to texts produced by the Indian elite in the Indian languages, as has been done most impressively by recent feminist scholars. It also means an unprecedented chance to lay our hands on a large body of written materials produced by distinctly non-elite sections of the people. It is foolish to suggest, as Ramachandra Guha does, that a 'library' of printed literature, even for colonial India, contains only the writings of the elite. On the contrary, what is now rapidly becoming clear to researchers in cultural history is the enormous volume of printed literature that could be sought out which carry the materials of subaltern history at a level of immediacy that it is impossible to find in any other source.

One can understand that a European historian such as Hans Medick, whom Ramachandra Guha cites, will not know of this peculiar problem with languages and sources that Indian historians have faced in the writing of their own history. It is astonishing that Guha, an Indian scholar, does not seem to be even remotely aware of the sea change that has taken place in modern Indian historiography in the last decades and a half. Indian history cannot be written any more except with materials in the Indian languages and for this the official archive as historians have known it for so long will no longer suffice.

A final point. *Subaltern Studies* has been admired and criticised in academic forums all over the world. But there has been a persistent strand in some of the criticisms that continues to be made in India which betrays a different anxiety. One of the achievements of *Subaltern Studies* scholarship is the systematic demonstration of the close complicity of elite ideologies, whether liberal, Gandhian or Marxist, with the emergence of new forms of domination and subordination in post-colonial India. This has made the enterprise of scholarship fraught with tension. It does not allow the scholar—the elite historian of the subaltern classes—to write without thinking reflexively of his or her own relation to the projects of power in his or her own society. This is hardly conducive to the writing of history as it was taught to us. Whatever be the shortcomings of the recent *Subaltern Studies*, it has at least ensured that simple-minded histories, based on what Ramachandra Guha calls 'the lived experience' of the people (a phrase that would make any decent philosopher squirm), will henceforth find few takers.

National Accounts Statistics of India - 6

Net State Domestic Product

IPW Research Foundation

THE final set of statistics in this six part NAS series present estimates of Net State Domestic Product (NSDP) and per capita state domestic product as well as compatible state wise data on NSDP by economic activity. These data are compiled by the directorates of economics and statistics of respective state governments at both current and constant prices. Over the years the measure of per capita State Domestic Product has also required direct operation if importance in that it is used by the Planning Commission for inter state allocation of some parts of the plan resource and by the Finance Commission for distribution of proceeds of union excise duties and additional excise duties amongst different states.

I Methodology and Data Sources

Since the early 1950's there have been concerted attempts by the CSO to provide a lead and to co-ordinate the estimates of state domestic product (SDP) specifically. First in 1957 the CSO set up the Working Group on State Income (WGSI) to undertake technical examination of the estimates of state income prepared by the then state statistical bureaux (SSBs) from time to time to make recommendations on the important gaps which could be filled to improve the estimates and to generally provide a standard set of concepts, definitions and methodology for the estimation of SDP.

The estimates of SDP are prepared broadly following the WGSI recommendations. The estimates of state income can be conceptually prepared by adopting two approaches. The first is the income originating approach where the measurement corresponds to income originating due to factors of production physically located within the geographical boundaries of a state and represent the value of goods and services produced within the state. The second approach relate to the income accruing to the normal residents of a state and corresponds to concepts of net national product at the national level. However due to non availability of data on flow of factor incomes the WGSI felt that SDP estimates be prepared by the income originating approach only.

At the second stage the Regional Accounts Committee (RAC) appointed by the CSO in 1972 recommended a set of consolidated accounts for each. Amongst the building blocks required for such consolidated accounts about ten states have prepared estimates of gross fixed capital

formation for few years (CSO 1991). The CSO has been apparently providing the necessary lead in this respect [Katyil and Rai 1991]. At the third stage the WGSI was replaced by the Technical Working Group for improvement of database for state income and related aggregates (TWG) in July 1981. The TWG reviews afresh the recommendations of the RAC as well as the problems of the state governments in implementing them.

Though there is now considerable degree of conformity in the concepts and methodology in the estimation of SDP it has always been the case that source material and data availability varied in different states. In addition state statistical systems are at different stages of development. As a result of these problems the CSO has discontinued even the collating of state government estimates and publishing them in the NAS.

II Inter-State Comparisons of NSDP

The data depicted in Tables 26-27 and 28 show that Maharashtra and Uttar Pradesh dominate as the highest SDP states followed though at some distance by West Bengal, Andhra Pradesh, Tamil Nadu, Madhya Pradesh and Gujarat (Tables 26A and 26B). The ranks of these top states have remained as between say 1950-81 and 1992-93 but there have been some significant alterations in ranks in respect of some other major states. In 1980-81 next to the above seven states Bihar occupied the eighth rank but by 1991-92 it had yielded the place to Karnataka, Punjab and Rajasthan continued to occupy the ninth and tenth positions in terms of the absolute size of the SDP. This is the position in SDP estimates at both current and constant prices.

The inter state position of states in terms of their per capita SDP seems to have remained unchanged for decades. Dealing with comparable series of per capita SDP Uma Datta Roy Choudhury (1993) reported such a result and it is found in the present series also that Punjab, Haryana, Gujarat and Maharashtra have the highest per capita incomes which are also higher than the all India NNP per capita. Interestingly the three southern states of Karnataka, Tamil Nadu and Andhra Pradesh have begun to touch the national average. Amongst the other major states Bihar and Orissa seem to lag behind in the growth of SDP per capita (Tables 27A and 27B).

As part of the national pattern the share of agriculture in the SDP of each state has

shown a steady decline except in the case of two major states namely Punjab and Rajasthan the former showing no change and the latter in fact rise. This has been at constant (1980-81) prices but in nominal SDP the agriculture share has shown a decline for Punjab suggesting that over the decade of the 1980s Punjab's agriculture has not enjoyed a favourable terms of trade until 1989-90 there has been some improvement in this since then which has not been captured here for want of subsequent data. Secondly Punjab has gained in terms of SDP share originating in manufacturing. Interestingly Bihar which has experienced a fall in SDP originating in agriculture has seen a significant increase in share of manufacturing but this is largely statistical in character as the overall growth of the Bihar economy has been relatively negligible. Otherwise the high per capita income states of Punjab, Haryana, Gujarat and Maharashtra have experienced an improvement in the share of GDI originating in manufacturing. Gujarat and Karnataka are the other two states which have experienced a similar improvement. The prominent states to show a decline in manufacturing share in the 1980s are West Bengal and Tamil Nadu (Tables 28A and 28B).

[This note and the accompanying statistical tables have been prepared by Purnima Debnath Bhagysree Mundke and V. P. Prishmit]

Notes

1. This note has relied heavily on definitions and description contained in CSO 1985 and CSO 1991.
2. As these are available only for a few years the same are not reproduced here (CSO 1991).
